Published under the editorial authority of ASHP®. Any correspondence regarding this publication should be sent to the publisher, American Society of Health-System Pharmacists, 4500 East-West Highway, Suite 900, Bethesda, MD 20814, attn: ASHP Injectable Drug Information or to [publications@ashp.org](mailto:publications@ashp.org).

The nature of drug information and its applications is constantly evolving because of ongoing research and clinical experience and is often subject to professional judgment and interpretation by the practitioner due to the uniqueness of each clinical situation and patient. While care has been taken to ensure the accuracy of the information presented, the reader is advised that the authors, editors, contributors, reviewers, and publisher cannot be responsible for the continued currency of the information, for any errors or omissions, and/or any consequences arising from the use of this information in a clinical setting.

Any reader of this work is cautioned that ASHP makes no representation, guarantee, or warranty, express or implied, as to the accuracy and appropriateness of the information contained in this work and specifically disclaims any liability to any party for the accuracy and/or completeness of the material contained in the work or for any damages arising out of the use or non-use of any of the information contained in this work.

Because of the dynamic nature of drug information, readers also are advised that decisions regarding drug use and patient care must be based on the independent judgment of the clinician, changing information about a drug (e.g., as represented in the literature), and changing professional practices.

# PREFACE

***ASHP® Injectable Drug Information™ 2021* is a collection of compatibility and stability information on parenteral drug products and is the most recent contribution to this continuing series. With its publication, all previous editions are considered out of date.**

One of the core focuses of ASHP as a professional and scientific society has been its long history of publishing internationally recognized, authoritative sources of drug information. Beginning with publication of the Society's ground-breaking work the *American Hospital Formulary Service® (AHFS®; now AHFS Drug Information®)* in 1959 and continuing with the definitive works the *Parenteral Drug Information Guide™* in 1974, the *Handbook on Injectable Drugs®* in 1977, and the *Medication Teaching Manual® (now AHFS Patient Medication Information™)* in 1978, ASHP has consistently set the standard for objective drug information focused on safe and effective drug therapy. For more than 75 years, ASHP has been at the forefront of efforts to improve medication use and patient safety. Publication of *ASHP® Injectable Drug Information™ 2021* is an important component of those efforts. With the 2021 edition of *ASHP® Injectable Drug Information™*, ASHP marks 49 years of publishing such an invaluable resource on parenteral medications.

First published in 1977 as a key outgrowth of pharmaceuticals research and pharmacy practice at the US Public Health Service and National Institutes of Health (NIH), the *Handbook on Injectable Drugs®* has a long legacy of translating pharmaceuticals research into an essential resource for practical patient-care applications. Lawrence A. Trissel, who served as co-author of ASHP's first resource on injectable drugs—the *Parenteral Drug Information Guide™*, established this legacy by serving as the distinguished author of the *Handbook on Injectable Drugs®* for the first 17 editions. ASHP and the profession as a whole remain grateful to Mr. Trissel for his contribution to the pharmaceuticals literature and his unyielding dedication to the science of stability and compatibility information on parenteral products.

With the publication of the *Mirror to Hospital Pharmacy* in 1964, ASHP paved the way for a transition from nursing-driven to pharmacy-led sterile compounding services and has remained an industry leader for both advocacy and best practices related to parenteral medications. The mission of ASHP's reference publications on compatibility and stability of parenteral products has always been to facilitate the use of the vast body of pharmaceuticals research on parenteral medications in a way that could enable those who prescribe, prepare, and administer injectable drugs to more fully apply this infor-

mation to the benefit of patients. With increasingly complex drug therapy regimens, an abundance of new drug and drug formulation approvals, and ever-present drug shortage issues, pharmaceuticals research has important implications for patient care in the inpatient, specialty pharmacy, and home infusion settings. Recent examples of inappropriate compounding practices involving parenteral medications have resulted in increased sterile compounding regulation and have reinforced the importance of adherence to sterile compounding standards, implementation of best practices in the preparation and administration of parenteral drug products (commercially available or extemporaneously compounded), and application of principles and findings of pharmaceuticals research to patient care. For additional information on sterile compounding, ASHP's Resource Center can be consulted ([www.ashp.org/sterilecompounding](http://www.ashp.org/sterilecompounding)).

Beginning with the 18th edition, the *Handbook on Injectable Drugs®* became an integral component of ASHP's *AHFS®* resource collection of authoritative drug information. Applying its expansive drug information and informatics expertise, ASHP's focus with the subsequent editions has been on the continuing addition and revision of new and existing drug monographs as well as important database enhancements to this indispensable authority on parenteral drugs. *ASHP® Injectable Drug Information™ 2021*, which was begun to provide a single standardized source of the primary research on the stability, compatibilities, and incompatibilities of injectable drugs, continues to be the most widely recognized "Gold Standard" for such information.

*ASHP® Injectable Drug Information™ 2021* includes 18 new monographs, bringing the total in this edition to 406 monographs on parenteral drugs available in the United States and in other countries. In addition, more than 500 revisions to existing monographs (affecting nearly 60% of the existing monographs) have been accomplished to update information on stability, compatibility, and safety (e.g., Food and Drug Administration [FDA] MedWatch alerts) and to provide more specific referencing of manufacturer information and other enhancements to the more than 24,100 compatibility pairs contained in *ASHP® Injectable Drug Information™ 2021*. The information cited throughout the text has been compiled from 3603 references, including 195 new to this edition. Because information from pharmaceutical manufacturers had not been uniquely cited until the 18th edition, the number of unique references supporting *ASHP® Injectable Drug Information™ 2021* information actually greatly exceeds this number. While primary,

peer-reviewed literature remains a major source of compatibility and stability information, ongoing efforts are underway to provide increased specificity of references to the pharmaceuticals research of drug manufacturers. Other relevant information and pertinent study details supplied by corresponding authors of the published literature also have been incorporated when available.

In addition to the noted enhancements to the 2021 print edition of *ASHP® Injectable Drug Information™* 2021, the regularly updated online edition features linked monographs to *Extended Stability for Parenteral Drugs*, forming a single, comprehensive resource on injectable drug information. This extended stability information is specifically designed for use in home infusion and other infusion practices, providing critical stability data to support realistic and cost-effective compounding and patient delivery schedules. *ASHP® Injectable Drug Information™* 2021 also will soon be available as an ebook in a variety of formats (e.g., PDF, EPUB, full-text HTML).

Regular updates, FDA MedWatch alerts and other guidances, and wall-chart custom views of compatibility information continue to be available for digital versions.

For proper use of this reference work, the reader must review "How to Use *ASHP® Injectable Drug Information™*," which immediately follows this Preface. This section will acquaint the user of *ASHP® Injectable Drug Information™* with its organization, content, structure, summarization strategy, interpretation of the information presented, and limitations of the published literature upon which this reference text is based. Without a good working knowledge of these points, *ASHP® Injectable Drug Information™* 2021 may not be used to its best advantage or even interpreted correctly.

# USERS GUIDE

## HOW TO USE ASHP® INJECTABLE DRUG INFORMATION™

### What Is ASHP® Injectable Drug Information™ ?

*ASHP® Injectable Drug Information™* is a collection of summaries of information from the published literature on the pharmaceuticals of parenteral medications as applied to the clinical setting. *ASHP® Injectable Drug Information™* is constructed from information derived from 3603 references with the information presented in the standardized structure described below. The purpose of this reference text is to facilitate the use of this clinical pharmaceuticals research by knowledgeable health care professionals for the benefit of patients. The summary information from published research is supplemented with information from the labeling of each product and from other references.

The information base summarized in *ASHP® Injectable Drug Information™* is large and highly complex, requiring thoughtful consideration for proper use. This reference text is not, nor should it be considered, elementary in nature or a primer. A single quick glance in a table is not adequate for proper interpretation of this highly complex information base. Proper interpretation includes the obvious need to consider and evaluate all relevant research information and results. Additionally, information on the formulation components (e.g., excipients), product attributes (especially pH), and the known stability behaviors of each parenteral drug, as well as the clinical situation of the patient, must be included in a thoughtful, reasoned evaluation of clinical pharmaceuticals questions. Stability and sterility both must be considered in the assignment of beyond-use dates.

### Who Should Use ASHP® Injectable Drug Information™?

*ASHP® Injectable Drug Information™* is designed for use as a professional reference and guide to the literature on the clinical pharmaceuticals of parenteral medications. The intended audience consists of knowledgeable healthcare professionals, particularly pharmacists, who are well versed in the formulation and clinical use of parenteral medications and who have the highly specialized knowledge base, training, and skill set necessary to interpret and apply the information. Practitioners who are not well versed in the formulation, essential properties, and clinical application of paren-

teral drugs should seek the assistance of more knowledgeable and experienced healthcare professionals to ensure patient safety.

Users of *ASHP® Injectable Drug Information™* must recognize that no reference work, including this one, can substitute for adequate decision-making by healthcare professionals. Proper clinical decisions must be made after considering all aspects of the patient's condition and needs, with particular attention to the special demands imposed by parenteral medications. *ASHP® Injectable Drug Information™* cannot make decisions for its users. However, in knowledgeable hands, it is a valuable tool for the proper use of parenteral medications.

### Organization of ASHP® Injectable Drug Information™

*ASHP® Injectable Drug Information™* has been organized as a collection of monographs on each of the drugs. The monographs are arranged alphabetically by nonproprietary (generic) name. The nonproprietary names of the drugs are the United States Adopted Names (USAN) and other official names for drugs as described in the *USP Dictionary of USAN and International Drug Names*. Also included are some of the trade (proprietary, brand) names and manufacturers of the drug products; this listing is not necessarily comprehensive and should not be considered an endorsement of any product or manufacturer.

All of the information included in *ASHP® Injectable Drug Information™* is referenced so that those who wish to study the original sources may find them. Efforts are ongoing to provide increased specificity of references to product labeling as individually cited references to the labeling for a drug product, including the proprietary name (if available), manufacturer, and revision date of the prescribing information; this will facilitate location of specific labeling that has been used as a reference. In addition, the full list of the *AHFS® Pharmacologic-Therapeutic Classification®* system and specific classification numbers within each individual monograph have been included to facilitate the location of therapeutic information on the drugs.

The monographs have been divided into the subheadings described below:

**Products**—lists many of the sizes, strengths, volumes, and forms in which the drug is supplied, along with other components of the formulation. Instructions for reconstitution (when applicable) are included in this section.

The products described do not necessarily comprise a comprehensive list of all available products. Rather, some common representative products are described. Furthermore, dosage forms, sizes, and container configurations of parenteral products may undergo important changes during the lifespan of this edition of *ASHP® Injectable Drug Information™*.

Following the product descriptions, the pH of the drug products, the osmotic value(s) of the drug and/or dilutions (when available), and other product information such as the sodium content and definition of units are presented.

Practitioners have not always recognized the value and importance of incorporating product formulation information into the thought process that leads to their decision on handling drug compatibility and stability questions. Excipients used in the formulation of commercially available products may vary among manufacturers and can influence drug compatibility and stability; specific product labeling should be consulted for additional formulation details. Consideration of the product information and formulation components, as well as the properties and attributes of the products (especially pH), is essential to proper interpretation of the information presented in *ASHP® Injectable Drug Information™*.

**Administration**—includes route(s) by which the drug can be given, rates of administration (when applicable), and other related administration details.

The administration information is a condensation derived principally from product labeling. For complete information, including dosage information sufficient for prescribing, the reader should refer to product labeling and therapeutically comprehensive references, such as the *AHFS® Drug Information®*.

**Stability**—describes the drug's stability and storage requirements. The storage condition terminology of *The United States Pharmacopeia*, 42nd ed., is used in *ASHP® Injectable Drug Information™*.

*The United States Pharmacopeia* defines controlled room temperature as a temperature that encompasses the usual and customary working environment of 20–25°C and that results in a mean kinetic temperature no greater than 25°C.<sup>17</sup> Temperature excursions between 15–30°C that are experienced in pharmacies, hospitals, warehouses, and during shipping are permitted.<sup>17</sup> Transient temperature elevations up to 40°C also are permitted provided that they do not persist beyond 24 hours and that the mean kinetic temperature does not exceed 25°C.<sup>17</sup> In contrast, room (ambient) temperature is defined simply as a temperature prevailing in a working environment.<sup>17</sup>

Protection from excessive heat is often required; excessive heat is defined as any temperature above 40°C.<sup>17</sup> Similarly, protection from freezing may be required for products that are subject to loss of strength or potency or to destructive alteration of their characteristics, in addition to the risk of container breakage, upon exposure to freezing temperatures.<sup>17</sup>

Some products may require storage at a cool temperature, which is defined as any temperature between 8–15°C, or a cold temperature, which is defined as any temperature not exceeding 8°C.<sup>17</sup> A refrigerator is defined as a cold place in which the temperature is controlled between 2–8°C.<sup>17</sup> A freezer refers to a place in which the temperature is controlled between -25 and -10°C.<sup>17</sup> Some products may have a recommended storage condition below -20°C, and in such cases, the temperature should be controlled to within 10°C of -20°C.<sup>17</sup>

In addition to storage requirements, aspects of drug stability related to pH, freezing, and exposure to light are presented in this section. Also presented is information on repackaging of the drugs or their dilutions in container/closure systems other than the original package (e.g., prefilling into syringes or in ambulatory pump reservoirs). Sorption and filtration characteristics of the drugs are provided as well when this information is available. The information is derived principally from the primary published research literature and is supplemented with information from other sources when available.

**Compatibility Information**—tabulates the compatibility results of the drug about which the monograph is written with infusion solutions and other drugs based on published reports from the primary research as well as the product labeling. The various entries are listed alphabetically by solution or drug name; the information is completely cross-referenced among the monographs.

Four types of tables are utilized to present the available information, depending on the kind of test being reported. The first type is for information on the compatibility of a drug in various infusion solutions and is depicted in **Table 1**. The second type of table presents information on two or more drugs in intravenous solutions and is shown in **Table 2**. The third type of table is used for tests of two or more drugs in syringes and is shown in **Table 3**. The fourth table format is used for reports of simulated or actual injection into Y-sites and manifolds of administration sets and is shown in **Table 4**.

Many published articles, especially older ones, do not include all of the information necessary to complete the tables. However, the tables have been completed as fully as possible from the original articles; in

some cases, editorial staff have supplemented the published information based on direct communication with the authors of the published research.

**Table 1. Solution Compatibility**

**Monograph drug name**

Solution	Mfr	Mfr	Conc/L or %	Remarks	Ref	C/I
(1)	(2)	(3)	(4)	(5)	(6)	(7)

1. Solution in which the test was conducted.
2. Manufacturer of the solution.
3. Manufacturer of the drug about which the monograph is written.
4. Concentration of the drug about which the monograph is written. (See *The Listing of Concentration*.)
5. Description of the results of the test.
6. Reference to the original source of the information.
7. Designation of the compatibility (C) or incompatibility (I) of the test result according to conventional guidelines.

**Table 2. Additive Compatibility**

**Monograph drug name**

Drug	Mfr	Conc/L or %	Mfr	Conc/L or %	Test Soln	Remarks	Ref	C/I
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)

1. Monograph title for the test drug.
2. Manufacturer of the test drug.
3. Concentration of the test drug.
4. Manufacturer of the drug about which the monograph is written.
5. Concentration of the drug about which the monograph is written. (See *The Listing of Concentration*.) Infusion solution in which the test was conducted.
6. Description of the results of the test.
7. Reference to the original source of the information.
8. Designation of the compatibility (C) or incompatibility (I) of the test result according to conventional guidelines.

**Table 3. Drugs in Syringe Compatibility**

**Monograph drug name**

Drug (in syringe)	Mfr	Amt	Mfr	Amt	Remarks	Ref	C/I
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)

1. Monograph title for the test drug.
2. Manufacturer of the test drug.
3. Actual amount of the test drug.
4. Manufacturer of the drug about which the monograph is written.
5. Actual amount of the drug about which the monograph is written.
6. Description of the results of the test.
7. Reference to the original source of the information.
8. Designation of the compatibility (C) or incompatibility (I) of the test result according to conventional guidelines.

**Table 4. Y-Site Injection Compatibility (1:1 Mixture)****Monograph drug name**

Drug	Mfr	Conc	Mfr	Conc	Remarks	Ref	C/I
(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)

1. Monograph title for the test drug
2. Manufacturer of the test drug.
3. Concentration of the test drug prior to mixing at the Y-site.
4. Manufacturer of the drug about which the monograph is written.
5. Concentration of the drug about which the monograph is written prior to mixing at the Y-site.
6. Description of the results of the test.
7. Reference to the original source of the information.
8. Designation of the compatibility (C) or incompatibility (I) of the test result according to conventional guidelines.

**Additional Compatibility Information**—provides additional information and discussions of compatibility presented largely in narrative form.

**Other Information**—contains any relevant auxiliary information concerning the drug that does not fall into the previous categories.

### The Listing of Concentration

The concentrations of all admixtures in intravenous solutions in the tables (Table 1 and Table 2) generally have been indicated in terms of concentration per liter (L) to facilitate comparison of the various studies. In some cases, this may result in amounts of the drug that are greater or lesser than those normally administered (as when the recommended dose is tested in 100 mL of vehicle), but the listings do accurately reflect the actual concentrations tested, expressed in standardized terms. Concentration may be expressed as a percentage for certain drugs or solutions (e.g., dextran, hetastarch, mannitol, fat emulsion) to reflect the style commonly used to express concentration for these products.

For studies involving syringes, the amounts actually used are indicated. The volumes are also listed if available.

For studies of actual or simulated Y-site injection of drugs, the concentrations are cited in terms of concentration per mL of each drug solution prior to mixing at the Y-site. Most published research reports have presented the drug concentrations in this manner, and *ASHP® Injectable Drug Information™* follows this convention. For those few published reports that presented the drug concentrations after mixing at the Y-site, the concentrations have been recalculated to be consistent with the more common presentation style to maintain the consistency of presentation in *ASHP® Injectable Drug Information™*. Note that the Y-Site Injection Compatibility table is designed with the assumption of a 1:1 mixture of the subject drug and infusion solution or admixture. For citations reporting other than a 1:1 mixture, the actual amounts tested are specifically noted.

### Designating Compatibility or Incompatibility

Each summary of a published research report appearing in the Compatibility Information tables bears a compatibility indicator (C, I, or ?). A report receives a designation of C when the study results indicate that compatibility of the test samples existed under the test conditions. If the study determined an incompatibility existed under the test conditions, then an I designation is assigned for the *ASHP® Injectable Drug Information™* entry for that study result. A designation of ? indicates that the test result does not clearly fit either the compatibility or incompatibility definition. Specific standardized guidelines are used to assign these compatibility designations and are described below. The citation is designated as a report of **compatibility** when results of the original article indicated one or more of the following criteria were met:

1. Physical or visual compatibility of the combination was reported (no visible or electronically detected indication of particulate formation, haze, precipitation, color change, or gas evolution).
2. Stability of the components for at least 24 hours in an admixture under the specified conditions was reported (decomposition of 10% or less).
3. Stability of the components for the entire test period, although in some cases it was less than 24 hours, was reported (time periods less than 24 hours have been noted).

The citation is designated as a report of **incompatibility** when the results of the original article indicated either or both of the following criteria were met:

1. A physical or visual incompatibility was reported (visible or electronically detected particulate formation, haze, precipitation, color change, or gas evolution).
2. Greater than 10% decomposition of one or more components in 24 hours or less under the specified

conditions was reported (time periods of less than 24 hours have been noted in the table).

Reports of test results that do not clearly fit into the compatibility or incompatibility definitions cannot be designated as either. These are indicated with a **question mark**.

Although these criteria have become the conventional definitions of compatibility and incompatibility, the reader should recognize that the criteria may need to be tempered with professional judgment. Inflexible adherence to the compatibility designations should be avoided. Instead, they should be used as aids in the exercising of professional judgment.

Therapeutic incompatibilities or other drug interactions are not within the scope of *ASHP® Injectable Drug Information™* and are therefore not addressed. Therapeutically comprehensive references and the product labeling should be consulted for such information.

## Interpreting Compatibility Information in *ASHP® Injectable Drug Information™*

As mentioned above, the body of information summarized in *ASHP® Injectable Drug Information™* is large and complicated. With the possible exception of a report of immediate gross precipitation, it usually takes some degree of thoughtful consideration and judgment to properly evaluate and appropriately act on the research results that are summarized in this book.

Nowhere is the need for judgment more obvious than when apparently contradictory information appears in two or more published reports. The body of literature in drug-drug and drug-solution compatibility is replete with apparently contradictory results. Except for study results that have been documented later to be incorrect, the conflicting information has been included in *ASHP® Injectable Drug Information™* to provide practitioners with all of the information for their consideration. The conflicting information will be readily apparent to the reader because of the content of the Remarks section as well as the *C*, *I*, and *?* designations following each citation.

Many or most of the apparently conflicting citations may be the result of differing conditions or materials used in the studies. A variety of factors that can influence the compatibility and stability of drugs must be considered in evaluating such conflicting results, and absolute statements are often difficult or impossible to make. Differences in concentrations, buffering systems, preservatives, vehicles, temperatures, and order of mixing all may play a role. By reviewing a variety of reports, the user of *ASHP® Injectable Drug Information™* is better able to exercise professional judgment with regard to compatibility and stability.

The reader must guard against misinterpretation of research results, which may lead to inappropriate assumptions of compatibility and stability. As an example, a finding of precipitate formation two hours after two drugs are mixed does not imply nor should it be interpreted to mean that the combination is compatible until that time point, when a sudden precipitation occurs. Rather, it should be interpreted to mean that precipitation occurred at some point between mixing and the first observation point at two hours. Such a result would lead to a designation of incompatibility in *ASHP® Injectable Drug Information™*.

Precipitation reports can be particularly troublesome for practitioners to deal with because of the variability of the time frames in which they may occur. Apart from combinations that repeatedly result in immediate precipitation, the formation of a precipitate can be unpredictable to some degree. Numerous examples of variable precipitation time frames can be found in the literature, including paclitaxel, etoposide, and sulfamethoxazole-trimethoprim (co-trimoxazole) in infusion solutions and calcium and phosphates precipitation in parenteral nutrition mixtures (e.g., TNAs, TPNs). Differing drug concentrations also can play a role in creating variability in results. A good example of this occurs with co-administered vancomycin hydrochloride and beta-lactam antibiotics. Users of the information in *ASHP® Injectable Drug Information™* must always be aware that a marginally incompatible combination might exhibit precipitation earlier or later than that reported in the literature. In many such cases, the precipitation is ultimately going to occur, it is just the timing that is in question. This is of particular importance for precipitate formation because of the potential for serious adverse clinical consequences, including death, that have occurred. Certainly, users of *ASHP® Injectable Drug Information™* information should always keep in mind and anticipate the possibility of precipitation and its clinical ramifications. Furthermore, all injections and infusions should be inspected for particulate matter and discoloration prior to administration. If found, such injections and solutions should be discarded.

In addition, many research reports cite test solutions or concentrations that may not be appropriate for clinical use. An example would be a report of a drug's stability in unsterile water. Although the *ASHP® Injectable Drug Information™* summary will accurately reflect the test solutions and conditions that existed in a study, it is certainly inappropriate to misinterpret a stability report like this as being an authorization to use the product clinically. In such cases, the researchers may have used the clinically inappropriate diluent to evaluate the drug's stability for extrapolation to a more suitable vehicle that is similar, or they may not have recognized that the diluent is clinically unsuitable. In either event, it is incumbent

on the practitioner in the clinical setting to use professional judgment to apply the information in an appropriate manner and recognize what is not acceptable clinically.

Further, it should be noted that many of the citations designated incompatible are not absolute. While a particular admixture may incur more than 10% decomposition within 24 hours, the combination may be useful for a shorter time period. The concept of "utility time" or the time to 10% decomposition may be useful in these cases. Unfortunately, such information is often not available. Included in the Remarks columns of the tables are the amount of decomposition, the time period involved, and the temperature at which the study was conducted when this information is available.

Users of *ASHP® Injectable Drug Information™* should always keep in mind that the information contained in this reference text must be used as a tool and a guide to the research that has been conducted and published. It is not a replacement for thoughtfully considered professional judgment. It falls to the practitioner to interpret the information in light of the clinical situation, including the patient's needs and status. What is certain is that relying solely on the C or I designation without the application of professional judgment is inappropriate.

## Limitations of the Literature

In addition to conflicting information, many of the published articles have provided only partial evaluations, not looking at all aspects of a drug's stability and compatibility. This is not surprising considering the complexity, difficulty, and costs of conducting such research. There are, in fact, articles that do provide evaluations of both physical stability/compatibility and chemical stability. But some are devoted only to physical issues, while others examine only chemical stability. Although a finding of precipitation, haze, or other physical effects may constitute an incompatibility (unless transient), the lack of such changes does not rule out chemical deterioration. In some cases, drugs initially designated as compatible because of a lack of visual change were later shown to undergo chemical decomposition. Similarly, the determination of chemical stability does not rule out the presence of unacceptable levels of particulates and/or turbidity in the combination. In a classic case, the drugs leucovorin calcium and fluorouracil were determined to be chemically stable for extended periods by stability-indicating HPLC assays in several studies, but years later, repeated episodes of filter clogging led to the discovery of unacceptable quantities of particulates in combinations of these drugs. The reader must always bear in mind these possibilities when only partial information is available.

And, finally, contemporary practitioners have come to expect that the analytical methods used in reports on the chemical stability of drugs will be validated, stability-indicating methods. However, many early studies used methods that were not demonstrated to be stability indicating.

Biological drugs (therapeutic proteins [e.g., enzymes, monoclonal antibodies, immune globulins]) are particularly sensitive to environmental factors and undergo more complex and numerous degradation pathways than classical drugs.<sup>3207 3208 3212</sup> In addition to physicochemical instability issues similar to those observed with classical drugs (e.g., precipitation, decomposition), such proteins are subject to other stability issues (e.g., protein conformation, biologic activity) that must be considered.<sup>3207 3208 3209 3212</sup> Therefore, a single analytic method that only assesses protein concentration is insufficient to determine stability of biological products.<sup>3209 3210</sup> Interpretation of the results of compatibility and stability studies of such proteins poses a challenge because both analytic methods and meaningful acceptance criteria should be specific to the biologic; official compendial standards (e.g., *The United States Pharmacopeia* monographs and analytic methods) should be consulted when available.<sup>3206 3209 3212</sup> Although many experts agree that multiple complementary methods should be used to assess the physical and chemical stability as well as assessment of biologic activity, no clear guideline or recommendation for in-use stability studies for therapeutic proteins is available.<sup>3208 3210 3211 3212</sup>

## Literature Search for Updating ASHP® Injectable Drug Information™

To gather the bulk of the published compatibility and stability information for updating *ASHP® Injectable Drug Information™*, a literature search is performed using the *International Pharmaceutical Abstracts™ (IPA™)* database and PubMed. By using key terms (e.g., stability), a listing of candidate articles for inclusion in *ASHP® Injectable Drug Information™* is generated. From this list, relevant articles are critically evaluated and prioritized for inclusion. As a supplement to this automated literature searching, a manual search of the references of the articles is also conducted, and any articles not included previously are similarly evaluated for inclusion. In addition, pharmaceutical manufacturers may be contacted for additional in-house (unpublished) data.

## ABBREVIATIONS

AA	Amino acids (percentage specified)
D	Dextrose solution (percentage unspecified)
D5LR	Dextrose 5% in Ringer's injection, lactated
D5R	Dextrose 5% in Ringer's injection
D-S	Dextrose-saline combinations
D2.5½S	Dextrose 2.5% in sodium chloride 0.45%
D2.5S	Dextrose 2.5% in sodium chloride 0.9%
D5¼S	Dextrose 5% in sodium chloride 0.225%
D5½S	Dextrose 5% in sodium chloride 0.45%
D5S	Dextrose 5% in sodium chloride 0.9%
D10S	Dextrose 10% in sodium chloride 0.9%
D5W	Dextrose 5%
D10W	Dextrose 10%
IM	Isolyte M
IP	Isolyte P
IS10	Invert sugar 10%
I.U. <sup>a</sup>	International unit(s)
LR	Ringer's injection, lactated
NM	Normosol M
NR	Normosol R
NRD5W	Normosol R in dextrose 5%
NS	Sodium chloride 0.9%
R	Ringer's injections
REF	Refrigeration
RT	Room temperature
S	Saline solution (percentage unspecified)
½S	Sodium chloride 0.45%
SL	Sodium lactate (1/6) M
TNA	Total nutrient admixture (3-in-1)
TPN	Total parenteral nutrition (2-in-1)
W	Sterile water for injection

<sup>a</sup> It is well accepted that "IU" is not a preferred abbreviation for international units. There is some difference of opinion among medication safety stakeholders on whether such units should be referred to simply as "units" or as "International Units." Throughout the text of this reference, we generally have used the term international units to describe such units; however, because of space limitations within the columns of the Compatibility Information tables, the term international units has been abbreviated as I.U. where necessary.

## MANUFACTURER AND COMPENDIUM ABBREVIATIONS

AB	Abbott
ABV	AbbVie
ABX	Abraxis
ACA	Acacia
ACC	American Critical Care
ACD	Accord Healthcare
ACH	Achaogen
ACT	Actavis
AD	Adria
AFT	AFT
AGT	Aguettant
AH	Allen & Hanburys
AHP	Ascot Hospital Pharmaceuticals
AKN	Akorn
ALL	Allergan
ALP	Alpharma
ALT	Altana Pharma
ALV	Alveda Pharma
ALZ	Alza
AM	ASTA Medica
AMA	AMAG
AMB	Amneal Biosciences
AMD	Amdipharm
AMG	Amgen
AMP	Amphastar
AMR	American Regent
AMS	Amerisource
AND	Andromaco
ANT	Antigen
AP	Asta-Pharma
APC	Apothecon
APN	Aspen
APO	Apotex
APP	American Pharmaceutical Partners
APR	Aspri
APT	Aspen Triton
AQ	American Quinine
AR	Armour
ARC	American Red Cross
ARD	Ardeapharm
ARR	Arrow
AS	Arnar-Stone
ASC	Ascot
ASP	Astellas Pharma
AST	Astra

ASZ	AstraZeneca	CEL	Celgene
AT	Alpha Therapeutic	CEN	Centocor
AUB	Aurobindo	CER	Cerenex
AUR	Auromedics	CET	Cetus
AVD	Avadel Legacy Pharmaceuticals	CH	Lab. Choay Societe Anonyme
AVE	Aventis	CHI	Chiron
AVG	Alvogen	CHS	Chiesi
AW	Asta Werke	CHU	Chugai
AY	Ayerst	CI	Ciba
AZV	Laboratórios Azevedos	CIS	CIS US
BA	Baxter	CL	Clintec
BB	B & B Pharmaceuticals	CLA	Claris Lifesciences
BAN	Banyu Pharmaceuticals	CLN	Clinigen
BAY	Bayer	CMB	Cumberland
BC	Bencard	CMP	CMP Pharma
BCT	BioCryst Pharmaceuticals	CN	Connaught
BD	Becton Dickinson	CNF	Centrafarm
BE	Beecham	CO	Cole
BED	Bedford	COM	CommScope
BEH	Behring	COR	COR Therapeutics
BEL	R. Bellon	COV	Covis
BFM	Bieffe Medital	CP	Continental Pharma
BI	Boehringer Ingelheim	CPP	CP Pharmaceuticals
BIO	Bioniche Pharma	CPR	Cooper
BK	Berk	CR	Critikon
BKN	Baker Norton	CRC	Caraco
BM	Boehringer Mannheim	CSL	CSL Ltd.
BMS	Bristol-Myers Squibb	CTI	Cell Therapeutics Inc.
BN	Breon	CU	Cutter
BP	British Pharmacopoeia	CUB	Cubist
BPC	British Pharmaceutical Codex <sup>b</sup>	CUP	Cura Pharmaceuticals
BPI	BPI Labs	CUR	Curomed

## AHFS CLASSIFICATION

### 4:00 - Antihistamine Drugs

#### 4:04 - First Generation Antihistamines

- 4:04.04 - Ethanolamine Derivatives\*
- 4:04.08 - Ethylenediamine Derivatives\*
- 4:04.12 - Phenothiazine Derivatives\*
- 4:04.16 - Piperazine Derivatives\*
- 4:04.20 - Propylamine Derivatives\*
- 4:04.92 - Miscellaneous Derivatives\*

#### 4:08 - Second Generation Antihistamines

#### 4:92 - Other Antihistamines\*

### 8:00 - Anti-infective Agents

#### 8:08 - Anthelmintics

#### 8:12 - Antibacterials

- 8:12.02 - Aminoglycosides
- 8:12.06 - Cephalosporins
  - 8:12.06.04 - First Generation Cephalosporins
  - 8:12.06.08 - Second Generation Cephalosporins
  - 8:12.06.12 - Third Generation Cephalosporins
  - 8:12.06.16 - Fourth Generation Cephalosporins
  - 8:12.06.20 - Fifth Generation Cephalosporins
  - 8:12.06.28 - Siderophore Cephalosporins
- 8:12.07 - Miscellaneous  $\beta$ -Lactams
  - 8:12.07.04 - Carbacephems\*
  - 8:12.07.08 - Carbapenems
  - 8:12.07.12 - Cephamycins
  - 8:12.07.16 - Monobactams
- 8:12.08 - Chloramphenicol
- 8:12.12 - Macrolides
  - 8:12.12.04 - Erythromycins
  - 8:12.12.12 - Ketolides\*
  - 8:12.12.92 - Other Macrolides
- 8:12.16 - Penicillins
  - 8:12.16.04 - Natural Penicillins
  - 8:12.16.08 - Aminopenicillins
  - 8:12.16.12 - Penicillinase-resistant Penicillins
  - 8:12.16.16 - Extended-spectrum Penicillins
- 8:12.18 - Quinolones
- 8:12.20 - Sulfonamides
- 8:12.24 - Tetracyclines
  - 8:12.24.04 - Aminomethylcyclines
  - 8:12.24.08 - Fluorocyclines
  - 8:12.24.12 - Glycylcyclines
- 8:12.28 - Antibacterials, Miscellaneous
  - 8:12.28.04 - Aminocyclitols\*
  - 8:12.28.08 - Bacitracins
  - 8:12.28.12 - Cyclic Lipopeptides
  - 8:12.28.16 - Glycopeptides

- 8:12.28.20 - Lincomycins
- 8:12.28.24 - Oxazolidinones
- 8:12.28.26 - Pleuromutilins
- 8:12.28.28 - Polymyxins
- 8:12.28.30 - Rifamycins
- 8:12.28.32 - Streptogramins
- 8:12.28.92 - Other Miscellaneous Antibacterials\*

#### 8:14 - Antifungals

- 8:14.04 - Allylamines
- 8:14.08 - Azoles
- 8:14.16 - Echinocandins
- 8:14.28 - Polyenes
- 8:14.32 - Pyrimidines
- 8:14.92 - Antifungals, Miscellaneous

#### 8:16 - Antimycobacterials

- 8:16.04 - Antituberculosis Agents
- 8:16.92 - Antimycobacterials, Miscellaneous

#### 8:18 - Antivirals

- 8:18.04 - Adamantanes
- 8:18.08 - Antiretrovirals
  - 8:18.08.04 - HIV Entry and Fusion Inhibitors
  - 8:18.08.08 - HIV Protease Inhibitors
  - 8:18.08.12 - HIV Integrase Inhibitors
  - 8:18.08.16 - HIV Nucleoside Reverse Transcriptase Inhibitors
  - 8:18.08.20 - HIV Nucleoside and Nucleotide Reverse Transcriptase Inhibitors
  - 8:18.08.92 - Antiretrovirals, Miscellaneous\*
- 8:18.20 - Interferons
- 8:18.24 - Monoclonal Antibodies
- 8:18.28 - Neuramidase Inhibitors
- 8:18.32 - Nucleosides and Nucleotides
- 8:18.40 - HCV Antivirals
  - 8:18.40.04 - HCV Cyclophilin Inhibitors\*
  - 8:18.40.08 - HCV Entry Inhibitors\*
  - 8:18.40.16 - HCV Polymerase Inhibitors
  - 8:18.40.20 - HCV Protease Inhibitors
  - 8:18.40.24 - HCV Replication Complex Inhibitors
  - 8:18.40.92 - HCV Antivirals, Miscellaneous\*
- 8:18.92 - Antivirals, Miscellaneous

#### 8:30 - Antiprotozoals

- 8:30.04 - Amebicides
- 8:30.08 - Antimalarials
- 8:30.92 - Antiprotozoals, Miscellaneous

#### 8:36 - Urinary Anti-infectives

#### 8:92 - Anti-infectives, Miscellaneous\*

### 10:00 - Antineoplastic Agents

### 12:00 - Autonomic Drugs

#### 12:04 - Parasympathomimetic (Cholinergic) Agents

#### 12:08 - Anticholinergic Agents

- 12:08.04 - Antiparkinsonian Agents\*
- 12:08.08 - Antimuscarinics/Antispasmodics

#### 12:12 - Sympathomimetic (Adrenergic) Agents

- 12:12.04 -  $\alpha$ -Adrenergic Agonists
- 12:12.08 -  $\beta$ -Adrenergic Agonists
  - 12:12.08.04 - Nonselective  $\beta$ -Adrenergic Agonists
  - 12:12.08.08 - Selective  $\beta_1$ -Adrenergic Agonists
  - 12:12.08.12 - Selective  $\beta_2$ -Adrenergic Agonists
- 12:12.12 -  $\alpha$ - and  $\beta$ -Adrenergic Agonists

#### 12:16 - Sympatholytic (Adrenergic Blocking) Agents

- 12:16.04 -  $\alpha$ -Adrenergic Blocking Agents
  - 12:16.04.04 - Nonselective  $\alpha$ -Adrenergic Blocking Agents
  - 12:16.04.08 - Nonselective  $\alpha_1$ -Adrenergic Blocking Agents\*
  - 12:16.04.12 - Selective  $\alpha_1$ -Adrenergic Blocking Agents
- 12:16.08 -  $\beta$ -Adrenergic Blocking Agents\*
  - 12:16.08.04 - Nonselective  $\beta$ -Adrenergic Blocking Agents\*
  - 12:16.08.08 - Selective  $\beta$ -Adrenergic Blocking Agents\*

#### 12:20 - Skeletal Muscle Relaxants

- 12:20.04 - Centrally Acting Skeletal Muscle Relaxants
- 12:20.08 - Direct-acting Skeletal Muscle Relaxants
- 12:20.12 - GABA-derivative Skeletal Muscle Relaxants
- 12:20.20 - Neuromuscular Blocking Agents
- 12:20.92 - Skeletal Muscle Relaxants, Miscellaneous

#### 12:92 - Autonomic Drugs, Miscellaneous

### 16:00 - Blood Derivatives

## 20:00 - Blood Formation, Coagulation, and Thrombosis

### 20:04 - Antianemia Drugs

- 20:04.04 - Iron Preparations
- 20:04.08 - Liver and Stomach Preparations\*

### 20:12 - Antithrombotic Agents

- 20:12.04 - Anticoagulants
  - 20:12.04.08 - Coumarin Derivatives
  - 20:12.04.12 - Direct Thrombin Inhibitors
  - 20:12.04.14 - Direct Factor Xa Inhibitors
  - 20:12.04.16 - Heparins
  - 20:12.04.92 - Anticoagulants, Miscellaneous
- 20:12.14 - Platelet-reducing Agents
- 20:12.18 - Platelet-aggregation Inhibitors
- 20:12.20 - Thrombolytic Agents
- 20:12.92 - Antithrombotic Agents, Miscellaneous

### 20:16 - Hematopoietic Agents

### 20:24 - Hemorrhologic Agents

### 20:28 - Antihemorrhagic Agents

- 20:28.08 - Antiheparin Agents
- 20:28.16 - Hemostatics
- 20:28.92 - Antihemorrhagic Agents, Miscellaneous

## 20:92 - Blood Formation, Coagulation, and Thrombosis Agents, Miscellaneous

## 24:00 - Cardiovascular Drugs

### 24:04 - Cardiac Drugs

- 24:04.04 - Antiarrhythmic Agents
  - 24:04.04.04 - Class Ia Antiarrhythmics
  - 24:04.04.08 - Class Ib Antiarrhythmics
  - 24:04.04.12 - Class Ic Antiarrhythmics
  - 24:04.04.16 - Class II Antiarrhythmics\*
  - 24:04.04.20 - Class III Antiarrhythmics
  - 24:04.04.24 - Class IV Antiarrhythmics
  - 24:04.04.92 - Antiarrhythmics, Miscellaneous
- 24:04.08 - Cardiotonic Agents
- 24:04.92 - Cardiac Drugs, Miscellaneous

### 24:06 - Antilipemic Agents

- 24:06.04 - Bile Acid Sequestrants
- 24:06.05 - Cholesterol Absorption Inhibitors
- 24:06.06 - Fibrin Acid Derivatives
- 24:06.08 - HMG-CoA Reductase Inhibitors
- 24:06.24 - Proprotein Convertase Subtilisin Kexin Type 9 (PCSK9) Inhibitors
- 24:06.92 - Antilipemic Agents, Miscellaneous

### 24:08 - Hypotensive Agents

- 24:08.04 -  $\alpha$ -Adrenergic Blocking Agents\*
- 24:08.08 -  $\beta$ -Adrenergic Blocking Agents\*
- 24:08.12 - Calcium-Channel Blocking Agents\*
  - 24:08.12.08 - Dihydropyridines\*

- 24:08.12.92 - Calcium-Channel Blocking Agents, Miscellaneous\*
- 24:08.16 - Central  $\alpha$ -Agonists
- 24:08.20 - Direct Vasodilators
- 24:08.20 - Direct Vasodilators
- 24:08.24 - Diuretics\*
  - 24:08.24.04 - Carbonic Anhydrase Inhibitors\*
  - 24:08.24.08 - Loop Diuretics\*
  - 24:08.24.12 - Osmotic Diuretics\*
  - 24:08.24.16 - Potassium-sparing Diuretics\*
  - 24:08.24.20 - Thiazide Diuretics\*
  - 24:08.24.24 - Thiazide-like Diuretics\*
  - 24:08.24.92 - Diuretics, Miscellaneous\*
- 24:08.32 - Peripheral Adrenergic Inhibitors
- 24:08.44 - Renin-Angiotensin-Aldosterone System Inhibitors\*
  - 24:08.44.04 - Angiotensin-Converting Enzyme Inhibitors\*
  - 24:08.44.08 - Angiotensin II Receptor Antagonists\*
  - 24:08.44.20 - Mineralocorticoid (Aldosterone) Receptor Antagonists\*
- 24:08.92 - Hypotensive Agents, Miscellaneous\*

### 24:12 - Vasodilating Agents

- 24:12.08 - Nitrates and Nitrites
- 24:12.12 - Phosphodiesterase Type 5 Inhibitors
- 24:12.92 - Vasodilating Agents, Miscellaneous

### 24:16 - Sclerosing Agents

### 24:20 - $\alpha$ -Adrenergic Blocking Agents

### 24:24 - $\beta$ -Adrenergic Blocking Agents

### 24:28 - Calcium-Channel Blocking Agents

- 24:28.08 - Dihydropyridines
- 24:28.92 - Calcium-Channel Blocking Agents, Miscellaneous

### 24:32 - Renin-Angiotensin-Aldosterone System Inhibitors

- 24:32.04 - Angiotensin-Converting Enzyme Inhibitors
- 24:32.08 - Angiotensin II Receptor Antagonists
- 24:32.20 - Mineralocorticoid (Aldosterone) Receptor Antagonists
- 24:32.40 - Renin Inhibitors
- 24:32.92 - Renin-Angiotensin-Aldosterone System Inhibitors, Miscellaneous

## 26:00 - Cellular Therapy\*

## 28:00 - Central Nervous System Agents

### 28:04 - General Anesthetics

- 28:04.04 - Barbiturates
- 28:04.16 - Inhalation Anesthetics\*
- 28:04.92 - General Anesthetics, Miscellaneous

### 28:08 - Analgesics and Antipyretics

- 28:08.04 - Nonsteroidal Anti-inflammatory Agents
  - 28:08.04.08 - Cyclooxygenase-2 (COX-2) Inhibitors
  - 28:08.04.24 - Salicylates
  - 28:08.04.92 - Other Nonsteroidal Anti-inflammatory Agents
- 28:08.08 - Opiate Agonists
- 28:08.12 - Opiate Partial Agonists
- 28:08.92 - Analgesics and Antipyretics, Miscellaneous

### 28:10 - Opiate Antagonists

### 28:12 - Anticonvulsants

- 28:12.04 - Barbiturates
- 28:12.08 - Benzodiazepines
- 28:12.12 - Hydantoins
- 28:12.16 - Oxazolidinediones\*
- 28:12.20 - Succinimides
- 28:12.92 - Anticonvulsants, Miscellaneous

### 28:16 - Psychotherapeutic Agents

- 28:16.04 - Antidepressants
  - 28:16.04.12 - Monoamine Oxidase Inhibitors
  - 28:16.04.16 - Selective Serotonin- and Norepinephrine-reuptake Inhibitors
  - 28:16.04.20 - Selective-serotonin Reuptake Inhibitors
  - 28:16.04.24 - Serotonin Modulators
  - 28:16.04.28 - Tricyclics and Other Norepinephrine-reuptake Inhibitors
  - 28:16.04.92 - Antidepressants, Miscellaneous
- 28:16.08 - Antipsychotics
  - 28:16.08.04 - Atypical Antipsychotics
  - 28:16.08.08 - Butyrophenones
  - 28:16.08.24 - Phenothiazines
  - 28:16.08.32 - Thioxanthenes
  - 28:16.08.92 - Antipsychotics, Miscellaneous
- 28:16.92 - Psychotherapeutic Agents, Miscellaneous\*

### 28:20 - Anorexigenic Agents and Respiratory and CNS Stimulants

- 28:20.04 - Amphetamines
- 28:20.08 - Anorexigenic Agents
  - 28:20.08.04 - Amphetamine Derivatives
  - 28:20.08.32 - Selective Serotonin Receptor Agonists
  - 28:20.08.92 - Anorexigenic Agents, Miscellaneous
- 28:20.32 - Respiratory and CNS Stimulants
- 28:20.80 - Wakefulness-promoting Agents

# Abciximab

AHFS 20:12.18

## Products

Abciximab is available as a 2-mg/mL solution, which also contains sodium phosphate 0.01 M, sodium chloride 0.15 M, and polysorbate 80 0.001% in water for injection.<sup>3278</sup>

## pH

7.2.<sup>3278</sup>

## Trade Name(s)

ReoPro

## Administration

Abciximab is administered by direct intravenous injection followed by continuous intravenous infusion using a controlled infusion device after dilution in sodium chloride 0.9% or dextrose 5%.<sup>3278</sup>

## Stability

The clear, colorless injection in intact vials should be stored under refrigeration and protected from freezing.<sup>3278</sup> The vials should not be shaken.<sup>3278</sup> No incompatibilities with glass bottles or PVC containers and sets have been observed.<sup>3278</sup>

Although refrigerated storage is required, the manufacturer has stated that the drug may be stored at room temperature for 8 days.<sup>2745</sup>

## Filtration

The manufacturer recommends filtration through a low protein-binding 0.2- or 5- $\mu$ m syringe filter during preparation of an intravenous infusion or using a 0.2- or 0.22- $\mu$ m inline filter during its administration.<sup>3278</sup> The manufacturer also recommends using a low protein-binding 0.2- or 5- $\mu$ m syringe filter for bolus doses.<sup>3278</sup>

## Acetaminophen

AHFS 28:08.92

Paracetamol

### Products

Acetaminophen injection is available in 100-mL glass vials containing 1 g of acetaminophen.<sup>2840</sup> Each 100 mL of the injection solution also contains mannitol 3.85 g, cysteine hydrochloride monohydrate 25 mg, and dibasic sodium phosphate anhydrous 10.4 mg.<sup>2840</sup> Hydrochloric acid and/or sodium hydroxide are used to adjust the pH.<sup>2840</sup>

### pH

Approximately 5.5.<sup>2840</sup>

### Tonicity

Acetaminophen injection is isotonic.<sup>2840</sup>

### Osmolality

The osmolality of acetaminophen 10-mg/mL injection was determined to be approximately 290 mOsm/kg.<sup>2840</sup>

### Trade Name(s)

Ofirmev

### Administration

For acetaminophen doses of 1 g, the dose should be administered by inserting a vented intravenous infusion set directly into the septum of the 100-mL glass vial.<sup>2840</sup>

For acetaminophen doses less than 1 g, the manufacturer recommends withdrawing the appropriate dose of acetaminophen 10-mg/mL injection from the intact, sealed, glass vial and transferring the

measured dose to an empty sterile container (e.g., glass bottle, plastic intravenous container, syringe), employing aseptic technique.<sup>2840</sup> The manufacturer states that the entire 100-mL vial is not intended for use in patients weighing less than 50 kg.<sup>2840</sup> Volumes less than 60 mL (e.g., pediatric doses) should be placed in syringes and administered over 15 minutes using a syringe pump.<sup>2840</sup>

Acetaminophen injection should be administered by intravenous infusion over 15 minutes.<sup>2840</sup>

### Stability

Acetaminophen injection is a clear, colorless solution.<sup>2840</sup> Intact containers should be stored at controlled room temperature and should not be refrigerated nor frozen.<sup>2840</sup>

The vials are for single use; any unused portions should be discarded.<sup>2840</sup> Once penetration of the vacuum seal of the glass vial has occurred or the solution has been transferred to another container, the manufacturer states that acetaminophen injection should be administered within 6 hours.<sup>2840</sup>

### Syringes

To assess stability in syringes, acetaminophen 10-mg/mL injection was withdrawn from the original glass vial in volumes of 10, 25, and 50 mL, which were repackaged undiluted in 10-, 30-, and 60-mL propylene syringes, respectively, to be stored at 23 to 25°C.<sup>2845</sup> After 84 hours, no physical changes were detected in acetaminophen injection by visual assessment, and the injection retained greater than 90% of the mean initial concentration regardless of storage container.<sup>2845</sup> Sterility, however, was not assessed.<sup>2845</sup>

## Compatibility Information

### Solution Compatibility

#### Acetaminophen

Test Soln Name	Mfr	Mfr	Conc/L or %	Remarks	Ref	C/I

## Acetazolamide Sodium

AHFS 52:40.12

### Products

Acetazolamide as the sodium salt is available in 500-mg (unpreserved) vials with sodium hydroxide and, if necessary, hydrochloric acid to adjust the pH.<sup>3011 3030</sup> Each 500-mg vial should be reconstituted with at least 5 mL of sterile water for injection.<sup>3011 3030</sup>

### pH

Approximately 9.6.<sup>3011 3030</sup>

### Osmolality

The osmolality of acetazolamide sodium 500 mg was calculated for the following dilutions:<sup>1054</sup>

Diluent	Osmolality (mOsm/kg)	
	50 mL	100 mL
Dextrose 5%	321	291
Sodium chloride 0.9%	348	317

### Sodium Content

2.049 mEq/500 mg (calculated).<sup>846</sup>

### Administration

Administration by direct intravenous injection is preferred; intramuscular injection is not recommended.<sup>3011 3030</sup>

## Compatibility Information

### Solution Compatibility

#### Acetazolamide sodium

Test Soln Name	Mfr	Mfr	Conc/L or %	Remarks	Ref	C/I

Dextrose 5% in sodium chloride 0.225%	AB	LE	375 mg	Physically compatible	3	C
Dextrose 5% in sodium chloride 0.45%	AB	LE	375 mg	Physically compatible	3	C
Dextrose 5% in sodium chloride 0.9%	AB	LE	375 mg	Physically compatible	3	C
Dextrose 10% in sodium chloride 0.9%	AB	LE	375 mg	Physically compatible	3	C

### Stability

Intact vials should be stored at controlled room temperature.<sup>3011 3030</sup> Acetazolamide is a white to faintly yellowish white powder.<sup>3011 3030</sup> The manufacturers state that the reconstituted solution is physically and chemically stable for 3 days at 2 to 8°C or for 12 hours at 20 to 25°C; however, storage of the reconstituted solution at 2 to 8°C and use of the solution within 12 hours after reconstitution is recommended.<sup>3011 3030</sup> Any unused portion should be discarded.<sup>3011 3030</sup>

### pH Effects

The stability of acetazolamide sodium in aqueous solution appears to decrease as the pH increases above 9. At pH 8.8, a 0.25-mg/mL solution retained 96% of the initial amount after 3 days at 25°C; at pH 10.8 and 12.7, 88 and 83% of the concentration, respectively, remained after 4 days.<sup>1230</sup> Acetazolamide exhibits maximum stability at pH 4.<sup>1424</sup>

### Sorption

Acetazolamide sodium was shown not to exhibit sorption to PVC bags and tubing, polyethylene tubing, Silastic tubing, and polypropylene syringes.<sup>536 606</sup>

# Acetylcysteine

## AHFS 92:12

### Products

Acetylcysteine injection is available in 30-mL single-dose vials as a preservative-free concentrated solution containing 200 mg/mL of drug.<sup>2861</sup> The solution also contains sodium hydroxide to adjust the pH.<sup>2861</sup> This concentrate must be diluted for use.<sup>2861</sup>

### pH

6 to 7.5.<sup>2861</sup>

### Osmolarity

Acetylcysteine injection has an osmolarity of 2600 mOsm/L.<sup>2861</sup>

### Trade Name(s)

Acetadote

### Administration

Acetylcysteine injection is a concentrate that must be diluted in a compatible infusion solution (e.g., dextrose 5%, sodium chloride 0.45%) for intravenous infusion.<sup>2861</sup>

For patients weighing 41 kg or more, the manufacturer recommends a loading dose be added to 200 mL for infusion over 60 minutes.<sup>2861</sup> Subsequently, a first maintenance dose should be mixed in 500 mL and delivered over 4 hours.<sup>2861</sup> The second maintenance dose should be mixed in 1 L and delivered over 16 hours.<sup>2861</sup>

The total volume must be adjusted for patients weighing 40 kg or less and fluid-restricted patients.<sup>2861</sup> For patients weighing

21 to 40 kg, the manufacturer recommends a loading dose be added to 100 mL for infusion over 60 minutes.<sup>2861</sup> Subsequently, a first maintenance dose should be mixed in 250 mL and delivered over 4 hours.<sup>2861</sup> The second maintenance dose should be mixed in 500 mL and delivered over 16 hours.<sup>2861</sup>

For patients weighing 5 to 20 kg, the manufacturer recommends a loading dose be diluted in 3 mL/kg of body weight for infusion over 60 minutes.<sup>2861</sup> Subsequently, a first maintenance dose should be mixed in 7 mL/kg of body weight and delivered over 4 hours.<sup>2861</sup> The second maintenance dose should be mixed in 14 mL/kg of body weight and delivered over 16 hours.<sup>2861</sup>

Acetylcysteine is a reducing agent and is not compatible with oxidizing agents. The drug is incompatible with rubber, and some metals such as iron and copper, liberating hydrogen sulfide gas. Consequently, the use of preparation and administration equipment composed of plastic, glass, and stainless steel or other unreactive metal is recommended.<sup>4</sup>

### Stability

Store intact vials of acetylcysteine injection at room temperature.<sup>2861</sup> The vials are for single use, and previously opened vials should be discarded and not used.<sup>2861</sup> The manufacturer states that the color of acetylcysteine injection may vary from colorless to slight pink or purple after stopper penetration, but this color change does not indicate an adverse effect on drug quality.<sup>2861</sup>

# Acyclovir Sodium

AHFS 8:18.32

## Products

Acyclovir sodium is available in vials containing 500 mg or 1 g of acyclovir as the sodium salt. Reconstitute the 500-mg vial with 10 mL and the 1-g vial with 20 mL of sterile water for injection; shake well to ensure complete dissolution. Do not use bacteriostatic water for injection containing parabens or benzyl alcohol for reconstitution. The acyclovir concentration in the reconstituted solution is 50 mg/mL; the reconstituted solution must be diluted to a concentration of 7 mg/mL or less for use.<sup>1(6/05) 4</sup>

## pH

The reconstituted solution has a pH of approximately 11.<sup>1(6/05) 4</sup>

## Osmolality

The osmolality of acyclovir sodium 500 mg was calculated for the following dilutions:<sup>1054</sup>

Diluent	Osmolality (mOsm/kg)	
	50 mL	100 mL
Dextrose 5%	316	289
Sodium chloride 0.9%	342	316

The osmolality of acyclovir sodium 7 mg/mL was determined to be 278 mOsm/kg in dextrose 5% and 299 mOsm/kg in sodium chloride 0.9%.<sup>1375</sup>

## Sodium Content

Acyclovir sodium (Glaxo Wellcome) contains 4.2 mEq of sodium per gram of drug.<sup>4</sup>

## Administration

Acyclovir sodium is administered by slow intravenous infusion at concentrations of 7 mg/mL or less over a period of 1 hour. Rapid intravenous administration and administration by other routes must be avoided.<sup>1(6/05) 4</sup>

## Stability

Intact vials of acyclovir sodium should be stored at controlled room temperature. The reconstituted solution should be used within 12 hours. Refrigeration of the reconstituted solution may cause a precipitate, but this precipitate will dissolve at room temperature, apparently without affecting potency. After dilution for administration, the dose may be stored at room temperature; it should be used within 24 hours.<sup>1(6/05) 4</sup> However, storage of acyclovir admixtures at room temperature does not guarantee that no precipitate will form. Precipitation also has been observed in acyclovir sodium infusions in polyvinyl chloride (PVC) containers after a few days' storage at room temperature.<sup>2190</sup>

If acyclovir sodium is diluted in solutions with dextrose concentrations greater than 10%, a yellow discoloration may appear. This discoloration does not affect the drug's potency.<sup>4</sup>

Acyclovir sodium reconstituted with bacteriostatic water for injection containing benzyl alcohol is as stable as when reconstituted with unpreserved sterile water for injection. However, the manufacturer recommends not using the benzyl alcohol-containing diluent because of concerns about the risks to neonates. The paraben-containing form of bacteriostatic water for injection must not be used for reconstitution because of the potential for precipitate formation.<sup>4</sup>

## Precipitation

Short-term refrigerated storage of acyclovir sodium admixtures with concentrations exceeding 1 mg/mL may result in formation of a precipitate that redissolves upon warming to room temperature. However, such solutions should be used immediately after warming to room temperature because of the subsequent appearance of persistent microprecipitates.<sup>2098</sup>

Physical instability is the principal limitation to long-term storage of acyclovir sodium admixtures. Persistent subvisual microprecipitate formation as well as frank persistent precipitation may occur in variable time periods. Such precipitation has been reported to occur after as little as 7 days and in varying time periods throughout a 35-day observation period; the appearance of a precipitate is not precisely predictable.<sup>2098</sup>

The formation of large amounts of subvisual particulates has been attributed to an interaction of the highly alkaline acyclovir sodium solution with PVC containers. Some increase in the number of particulates was observed in as little as 1 day, with substantial increases in 7 days. When packaged in ethylene vinyl acetate (EVA) containers, no significant increase in subvisual particulates occurs, even after 28 days of storage.<sup>2190</sup>

## Freezing Solutions

Acyclovir (GlaxoSmithKline; Hospira) 5 mg/mL in sodium chloride 0.9% in polyolefin bags was found to be physically stable with less than 10% loss reported when frozen at  $-20^{\circ}\text{C}$  for 90 days followed by thawing in a microwave oven and subsequent storage at 2 to  $8^{\circ}\text{C}$  for 15 days.<sup>3300</sup>

## Syringes

Acyclovir sodium (American Pharmaceutical Partners) 10 mg/mL in sodium chloride 0.9% and packaged in polypropylene syringes (Becton Dickinson) was found to be stable for 30 days at room temperature but precipitated in 5 days under refrigeration.<sup>2558</sup>

## Sorption

Acyclovir sodium was shown not to exhibit sorption to PVC, polyethylene, and glass containers as well as elastomeric reservoirs.<sup>2014 2289</sup>

## Central Venous Catheter

Acyclovir sodium (GlaxoWellcome) 1 mg/mL in dextrose 5% was found to be compatible with the ARROWgard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with

little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

<sup>a</sup> Tested in dextrose 5%.

<sup>b</sup> Tested in sodium chloride 0.9%.

<sup>c</sup> Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>d</sup> Tested in sterile water for injection.

<sup>e</sup> Lyophilized formulation tested.

<sup>f</sup> Refer to Appendix for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>g</sup> Tested in Ringer's injection, lactated.

<sup>h</sup> Test performed using the formulation WITHOUT edetate disodium.

<sup>i</sup> Tested in sodium chloride 0.45%.

<sup>j</sup> Piperacillin component. Piperacillin in an 8:1 fixed-ratio concentration with tazobactam.

<sup>k</sup> Trimethoprim component. Trimethoprim in a 1:5 fixed-ratio concentration with sulfamethoxazole.

<sup>l</sup> Imipenem component. Imipenem in a 1:1 fixed-ratio concentration with cilastatin.

<sup>m</sup> Quinupristin and dalfopristin components combined.

<sup>n</sup> Salt not specified.

<sup>o</sup> Test performed using the formulation WITH edetate disodium.

## Adenosine

AHFS 24:04.04.24

### Products

Adenosine is available as a 3-mg/mL solution with sodium chloride 9 mg/mL in 2- and 4-mL disposable syringes and single-use vials for rapid intravenous bolus injection only.<sup>2991 2993</sup> Adenosine is also available as a 3-mg/mL solution in single-use vials with sodium chloride 9 mg/mL in 20- and 30-mL vials for intravenous infusion only.<sup>2992</sup>

### pH

From 4.5 to 7.5.<sup>2991 2992 2993</sup>

### Trade Name(s)

Adenocard IV, Adenoscan

### Administration

Adenosine injections are administered intravenously.<sup>2991 2992 2993</sup> Adenosine for rapid intravenous bolus injection only is administered by the peripheral intravenous route directly into a vein or into an intravenous line close to the patient and is followed by a rapid sodium chloride 0.9% flush.<sup>2991 2993</sup> Adenosine for intravenous infusion only is administered by continuous peripheral intravenous infusion over 6 minutes.<sup>2992</sup>

### Stability

Intact containers of adenosine injection should be stored at controlled room temperature.<sup>2991 2992 2993</sup> The drug should not be refrigerated due to the possibility of crystallization.<sup>2991 2992 2993</sup> If crystallization occurs, let the solution warm to room temperature to dissolve the crystals.<sup>2991 2992 2993</sup> The solution must be clear prior to administration.<sup>2991 2992 2993</sup>

Adenosine 6 mcg/mL in sodium chloride 0.9% was packaged in 5-mL glass ampuls. Based on analysis of high-temperature-

accelerated decomposition, it was projected that the drug solution would be stable for at least 5 years at 4 and 25°C.<sup>2115</sup>

Adenosine 2 mg/mL in sodium chloride 0.9% was packaged in glass vials and stored for 6 months at temperatures ranging from 4 to 72°C. Analysis found no loss of adenosine in samples stored at 4, 22, and 37°C.<sup>2277</sup>

Adenosine 80 mg/L and 330 mg/L in cardioplegia solutions having high (100 mmol/L) and low (30 mmol/L) concentrations of potassium was stored at 4 and 23°C. The solutions also contained tromethamine (THAM) 12 mmol/L, magnesium sulfate 9 mmol/L, dextrose 250 mmol/L, and citrate-phosphate-dextrose-adenine solution 20 mL/L. No adenosine loss occurred after 14 days of storage in either solution.<sup>2402</sup>

### Syringes

Undiluted adenosine (Fujisawa) 3 mg/mL was packaged as 25 mL in 60-mL polypropylene syringes (Becton Dickinson) and sealed with polyolefin tip caps (Sherwood Medical). The syringes were stored at 25, 5, and -15°C. The solutions remained visually clear, and analysis showed no loss of adenosine in 7 days at 25°C, 14 days at 5°C, and 28 days at -15°C. The drug's stability in glass vials was essentially identical under the same conditions.<sup>2114</sup>

Adenosine (Fujisawa) diluted to 0.75 mg/mL with several infusion solutions was packaged as 25 mL in 60-mL polypropylene syringes (Becton Dickinson) and sealed with polyolefin tip caps (Sherwood Medical). The syringes were stored at 25, 5, and -15°C. The solutions remained visually clear, and analysis showed no loss of adenosine in 14 days for dextrose 5% in Ringer's injection, lactated and Ringer's injection, lactated and 16 days for dextrose 5% and sodium chloride 0.9%.<sup>2114</sup>

## Albumin Human

### AHFS 16:00

### Products

Albumin human is available in 20-, 50-, and 100-mL vials as a 25% aqueous solution. Each 100 mL of solution contains 25 g of serum albumin. Albumin human is also available as a 5% aqueous solution in 50-, 250-, 500-, and 1000-mL sizes. The products also contain sodium carbonate, sodium bicarbonate, sodium hydroxide, and/or acetic acid to adjust the pH.<sup>1(1/05) 4</sup> The products are heat-treated for inactivation of hepatitis viruses. Sodium caprylate and sodium *N*-acetyltryptophanate are added to the products as stabilizers to prevent denaturation during the heat treatment. Low aluminum-containing albumin human products contain less than 200 mcg/L of aluminum.<sup>1(1/05)</sup>

### pH

From 6.4 to 7.4.<sup>1(1/05) 4</sup>

### Sodium Content

From 130 to 160 mEq/L.<sup>1(1/05) 4</sup>

### Trade Name(s)

Albuminar, Albutein, Albumarc, Buminat, Plasbumin

### Administration

Albumin human is administered intravenously either undiluted or diluted in an intravenous infusion solution having sufficient osmolality to be safely administered.<sup>1(1/05) 4</sup>

**CAUTION**—Substantial reduction in tonicity, creating the potential for fatal hemolysis and acute renal failure, may result from the use of sterile water as a diluent. The hemolysis and acute renal failure that result from the use of a sufficient volume of sterile water as a diluent may be life-threatening.<sup>4 1942 2072 2073</sup>

### Stability

Albumin human has been variously described as clear amber to deep orange-brown and as a transparent or slightly opalescent pale straw to dark brown solution. The solution should not be used if it is turbid or contains a deposit. Since it contains no preservative, the manufacturer recommends use within 4 hours after opening the vial. The expiration date is 5 years after issue from the manufacturer if the labeling recommends storage between 2 and 8 or 10°C, or not more than 3 years after issue from the manufacturer if the labeling recommends storage at temperatures not greater than 30 or 37°C.<sup>4</sup>

The addition of albumin human to parenteral nutrition solutions has resulted in occlusion of filters at concentrations ranging from over 25 g/L to 10.8 g/L.<sup>854 1634</sup>

### Freezing Solutions

Freezing the albumin human solutions may damage the container and result in contamination.<sup>4</sup>

# Aldesleukin

## AHFS 10:00

### Interleukin-2

## Products

Aldesleukin is available in single-use vials containing 22 million international units (1.3 mg of protein). When reconstituted with 1.2 mL of sterile water for injection, each mL contains aldesleukin 18 million international units (1.1 mg) along with mannitol 50 mg, sodium dodecyl sulfate 0.18 mg, monobasic sodium phosphate 0.17 mg, and dibasic sodium phosphate 0.89 mg. During reconstitution, the sterile water for injection should be directed at the vial's sides. Swirl the contents gently to cause dissolution and avoid excess foaming. Do not shake the vial. Do not use bacteriostatic water for injection.<sup>1(10/08)</sup>

## Units

The biological potency of aldesleukin is determined by the lymphocyte proliferation bioassay and is expressed in international units ("I.U."). Aldesleukin 18 million international units equals 1.1 mg of protein.<sup>1(10/08)</sup> During the development of aldesleukin, various unit systems were employed. However, the international unit is now the standard measure of its activity.

## pH

The reconstituted product has a pH of 7.2 to 7.8.<sup>1(10/08)</sup>

## Trade Name(s)

Proleukin

## Administration

Aldesleukin is administered intravenously; the reconstituted solution should be diluted in 50 mL of dextrose 5% and infused over 15 minutes. Inline filters should not be used.<sup>1(10/08)</sup> <sup>4</sup> The drug should be diluted within the concentration range of 30 to 70 mcg/mL for administration. Concentrations of aldesleukin below 30 mcg/mL and above 70 mcg/mL have shown increased variability in drug delivery. Dilution and drug delivery outside this concentration range should be avoided.<sup>1(10/08)</sup>

If aldesleukin concentrations less than 30 mcg/mL are necessary for short-term intravenous infusion of 15 minutes, the manufacturer recommends diluting the dose in dextrose 5% that contains albumin human 0.1% to prevent variability in the stability and bioactivity of the drug.<sup>4</sup> <sup>1890</sup>

## Stability

Aldesleukin is a white to off-white powder; it becomes a colorless to slightly yellow liquid when reconstituted.<sup>1(10/08)</sup>

Intact vials should be stored under refrigeration and protected from light.<sup>1(10/08)</sup> However, aldesleukin in intact vials is stable for at least 2 months at controlled room temperature.<sup>1890</sup> The reconstituted solution, as well as dilutions in infusion solutions for intravenous administration, should also be stored under refrigeration and protected from freezing. Intravenous infusions should be brought to room temperature before administration.<sup>1(10/08)</sup>

The manufacturer indicates that reconstituted and diluted aldesleukin is stable for 48 hours when stored at room temperature or under refrigeration. Refrigeration is recommended because the product contains no antibacterial preservative.<sup>1(10/08)</sup>

## Syringes

Aldesleukin (Cetus), reconstituted according to label directions, was evaluated for stability when stored in 1-mL plastic syringes (Becton Dickinson). One- and 0.5-mL aliquots were drawn into these syringes and refrigerated for 5 days. The product was physically stable and retained activity by biological analysis (cell proliferation assay) throughout the study period.<sup>1821</sup>

Reconstituted aldesleukin diluted to a concentration of 220 mcg/mL with dextrose 5% was repackaged aseptically as 1 mL drawn into tuberculin syringes and stored under refrigeration at 2 to 8°C. The drug was found to be stable for the 14-day study period.<sup>1890</sup>

## Ambulatory Pumps

For continuous intravenous infusion of aldesleukin in concentrations of 70 mcg/mL or less via an ambulatory pump at the accompanying higher temperature of near 32°C, the dose should be diluted in dextrose 5% to which albumin human at a concentration of 0.1% has been added to maintain aldesleukin stability.<sup>1890</sup> The albumin human helps keep aldesleukin in its microaggregate state and helps decrease sorption to surfaces, especially at concentrations below 10 mcg/mL.<sup>4</sup> In the absence of albumin human, visually observed precipitation and loss of aldesleukin activity has been found. At concentrations greater than 70 and less than 100 mcg/mL at 32°C, aldesleukin is unstable whether albumin human is present or not.<sup>1890</sup>

Aldesleukin (Cetus) 5 to 500 mcg/mL in dextrose 5% was evaluated for stability in polyvinyl chloride (PVC) containers during simulated administration from pumps (CADD-1, Pharmacia Deltec). At 100 to 500 mcg/mL, aldesleukin was stable for 6 days at 32°C and remained visually clear throughout the study period. At concentrations of 5 and 40 mcg/mL, however, albumin human 0.1% was necessary to maintain physical stability. The aldesleukin solutions with albumin human remained clear and remained active for 6 days at 32°C. Without albumin human, precipitation occurred within a few hours.<sup>1821</sup>

## Sorption

Aldesleukin in low concentrations, particularly less than 10 mcg/mL, undergoes sorption to surfaces such as plastic bags, tubing, and administration devices. Addition of 0.1% albumin human to the solution decreases the extent of sorption.<sup>4</sup> Both glass and PVC containers have been used to infuse aldesleukin with comparable clinical results. However, drug delivery may be more consistent with PVC containers.<sup>1(10/08)</sup> <sup>4</sup>

## Filtration

Inline filters should not be used for aldesleukin.<sup>1(10/08)</sup> <sup>4</sup>

# Alfentanil Hydrochloride

AHFS 28:08.08

## Products

Alfentanil hydrochloride is available at a concentration equivalent to alfentanil base 500 mcg/mL with sodium chloride for isotonicity in 2-, 5-, 10-, and 20-mL ampuls.<sup>1(10/06)</sup>

## pH

From 4 to 6.<sup>1(10/06)</sup>

## Osmolality

Alfentanil hydrochloride injection is isotonic.<sup>1(10/06)</sup>

## Trade Name(s)

Alfenta

## Administration

Alfentanil hydrochloride is administered by intravenous injection or infusion. For infusion, dilution to 25 to 80 mcg/mL in a compatible solution has been utilized.<sup>1(10/06)</sup>

## Stability

Alfentanil hydrochloride injection is stable at controlled room temperature when protected from light.<sup>1(10/06)</sup>

### Syringes

Alfentanil hydrochloride (Janssen) 0.5 mg/mL in dextrose 5% was packaged in 20-mL polypropylene syringes (Becton Dickinson) and stored at 20°C exposed to light and at 8°C for 16 weeks. The solutions were visually clear and colorless throughout the study. No loss of alfentanil hydrochloride occurred and no leached substances from the plastic syringes appeared.<sup>2191</sup>

Alfentanil hydrochloride (Janssen) 0.167 mg/mL in sodium chloride 0.9% in polypropylene syringes (Sherwood) was physically stable and exhibited little loss in 24 hours stored at 4 and 23°C.<sup>2191</sup>

### Sorption

Alfentanil hydrochloride (Janssen) (concentration unspecified) was found to be compatible with polyethylene, polypropylene, and polyvinyl chloride (PVC).<sup>2468</sup>

## Allopurinol Sodium

AHFS 92:16

### Products

Allopurinol sodium is available in single-use vials containing the equivalent of 500 mg of allopurinol in lyophilized form. Reconstitute with 25 mL of sterile water for injection to yield an almost colorless concentrated solution that is clear to slightly opalescent.<sup>1(8/05)</sup>

### pH

From 11.1 to 11.8.<sup>4</sup>

### Trade Name(s)

Aloprim

### Administration

The reconstituted solution must be diluted for use in sodium chloride 0.9% or dextrose 5% to a final concentration of no

greater than 6 mg/mL. The diluted infusion is given as a single infusion daily or in equally divided infusions at 6-, 8-, or 12-hour intervals. The rate of infusion depends on the volume to be infused.<sup>1(8/05)</sup>

### Stability

Allopurinol sodium is supplied as a white lyophilized powder. The intact vials should be stored at controlled room temperature. Administration should begin within 10 hours of reconstitution. The reconstituted solution and diluted infusion solution should not be refrigerated.<sup>1(8/05)</sup>

# Alprostadil

AHFS 24:12.92

## Products

Alprostadil for intravenous use is available as a 500-mcg/mL concentrate in dehydrated alcohol packaged in ampuls and vials. The concentrate must be diluted in a compatible infusion solution for use.<sup>1(1/05)</sup>

## Administration

For continuous intravenous or intra-arterial infusion in neonates, alprostadil concentrate is diluted by adding 500 mcg (one vial of concentrate) to 25, 50, 100, or 250 mL of dextrose 5% or sodium chloride 0.9% to yield 20, 10, 5, or 2 mcg/mL, respectively. The diluted solution is administered using a controlled infusion device.<sup>1(1/05)</sup>

## Stability

Intact containers of alprostadil concentrate should be stored under refrigeration. Alprostadil concentrate diluted for infusion is stable for up to 24 hours in the infusion solution.<sup>1(1/05)</sup>

Alprostadil is reported not to be subjected to increased degradation due to ambient light exposure.<sup>2639</sup>

Undiluted alprostadil concentrate may interact with plastic volumetric infusion chambers changing their appearance and resulting in a hazy solution. Consequently, the infusion solution should be added to the volumetric chamber first with the alprostadil concentrate added into the solution avoiding contact with the chamber walls.<sup>1(1/05)</sup>

## pH Effects

Alprostadil is more stable at acidic pH values compared to neutral and especially alkaline pH. The pH of maximum stability has been reported to be pH 3.<sup>2639</sup>

## Syringes

Alprostadil 500 mcg/mL undiluted and also diluted with sodium chloride 0.9% to concentrations near 250 and 125 mcg/mL was packaged in 1-mL polypropylene syringes (Becton Dickinson). After 30 days stored at 4°C, 5% or less alprostadil loss occurred.<sup>2602</sup>

# Alteplase

**AHFS 20:12.20****t-PA**

## Products

Alteplase is available as a sterile lyophilized powder in 50- and 100-mg vials. The products also contain L-arginine, phosphoric acid, and polysorbate 80.<sup>1(12/05)</sup>

The pH may have been adjusted with phosphoric acid and/or sodium hydroxide. Intact 50-mg vials contain a vacuum, but the 100-mg vials do not.<sup>1(12/05)</sup>

The alteplase vials are accompanied by 50- and 100-mL vials of sterile water for injection for the 50- and 100-mg sizes, respectively. Alteplase should be reconstituted with sterile water for injection only; do not use solutions containing preservatives. Use of the accompanying diluent results in a 1-mg/mL concentration. The manufacturer recommends use of a large bore needle to direct the stream into the lyophilized cake of the 50-mg vials. For the 100-mg vials, the special transfer device should be used. The vials should be swirled gently—not shaken—to dissolve the drug. Excessive agitation should be avoided. Although slight foaming may occur, the bubbles will dissipate after standing for several minutes.<sup>1(12/05)</sup>

Cathflo Activase is available in alteplase 2.2-mg vials with L-arginine 77 mg, polysorbate 80 0.2 mg, and phosphoric acid to adjust pH. Reconstitute with 2.2 mL of sterile water for injection and gently swirl to yield a 1-mg/mL solution; do not shake. If slight foaming occurs, allow the solution to stand for a few minutes until the bubbles dissipate. Do not use bacteriostatic water for injection with a preservative as a diluent.<sup>1(12/05)</sup>

## Specific Activity

Alteplase is a purified glycoprotein with a specific activity of 580,000 international units/mg. The 50-mg vial contains 29 million international units, and the 100-mg vial contains 58 million international units.<sup>1(12/05)</sup>

## pH

Approximately 7.3.<sup>1(12/05)</sup>

## Osmolality

The product has an osmolality of 215 mOsm/kg.<sup>1(12/05)</sup>

## Trade Name(s)

Activase

## Administration

Alteplase is administered by intravenous infusion, directly after reconstitution to a 1-mg/mL concentration or diluted with an equal volume of sodium chloride 0.9% or dextrose 5% to a 0.5-mg/mL concentration.<sup>1(12/05)</sup> <sup>4</sup> Dilution to a lower concentration may result in precipitation.<sup>4</sup> <sup>1425</sup>

Alteplase has been effective and well tolerated in catheter clearance.<sup>1(12/05)</sup> <sup>2328</sup> <sup>2329</sup> <sup>2330</sup> <sup>2446</sup> <sup>2635</sup>

## Stability

Alteplase, an off-white lyophilized powder, becomes a colorless to pale yellow solution on reconstitution. Intact vials should be refrigerated or stored at room temperature with protection from extended exposure to light. The 50-mg vials should not be used unless a vacuum is present. Cathflo Activase should be stored under refrigeration.<sup>1(12/05)</sup>

Because alteplase has no bacteriostat, the manufacturer recommends reconstitution immediately before use. However, the solution may be administered within 8 hours when stored at room temperature or under refrigeration.<sup>1(12/05)</sup> Exposure to light does not affect the potency of either reconstituted solutions of alteplase or dilutions in compatible infusion solutions.<sup>1(12/05)</sup> <sup>4</sup>

Alteplase is stated to be incompatible with the preservatives used in bacteriostatic water for injection because preservatives can interact with the alteplase molecule.<sup>4</sup> Even so, alteplase was reconstituted with sterile water for injection and also bacteriostatic water for injection (benzyl alcohol 0.9%) to yield a 1-mg/mL solution. The test solutions were stored at 37°C and remained clear and colorless. In vitro clot lysis testing found activity was retained for at least 7 days. The USP antimicrobial effectiveness test was performed as well. The samples reconstituted with sterile water failed the test while the samples reconstituted with bacteriostatic water for injection passed.<sup>2668</sup>

## pH Effects

Alteplase in solution is stable at pH 5 to 7.5.<sup>4</sup>

## Freezing Solutions

A 50-mg vial of alteplase (Genentech), reconstituted with sterile water for injection to a concentration of 1 mg/mL, was diluted with balanced saline solution to a final concentration of 250 mcg/mL. Then 0.3-mL (75 mcg) portions of the diluted solution were drawn into 1-mL tuberculin syringes and frozen at -70°C. Alteplase activity was retained for at least 1 year.<sup>2157</sup>

However, others have objected to frozen storage of diluted alteplase solution. It was noted that the alteplase formulation has been designed for optimal stability, and dilution to a concentration lower than 500 mcg/mL might adversely affect the drug's solubility by diluting the formulation's solubilizing components. Furthermore, it was noted that the calcium or magnesium salts contained in some diluents might interact with the phosphates present in the alteplase formulation to form a precipitate. Indeed, precipitated protein has been found in diluted alteplase after room temperature storage for 24 hours. Frozen storage at -20°C with subsequent thawing has resulted in changed patterns of light scattering as well. It was recommended that dilution with balanced saline solution and storage of dilutions for any length of time at room temperature or frozen should be avoided.<sup>2158</sup>

Use of a diluent containing polysorbate 80, L-arginine, and phosphoric acid to reconstitute and dilute alteplase to 50 mcg/mL is reported to permit frozen storage. Although the report did not specify the exact concentrations of the diluent components, it may have duplicated the alteplase vehicle after reconstitution. Use of this diluent for dilution prevented precipitation of the protein upon frozen storage at  $-20^{\circ}\text{C}$ . In addition, the activity in ophthalmic use was found to be unchanged after storage for 6 months in the frozen state.<sup>2159</sup>

Alteplase (Genentech) concentrations of 0.5, 1, and 2 mg/mL in sterile water for injection were packaged as 1 mL of solution in 5-mL polypropylene syringes and sealed with rubber tip caps. Sample syringes were stored frozen at  $-70$  and  $-25^{\circ}\text{C}$  for up to 14 days as well as refrigerated at  $2^{\circ}\text{C}$ . Frozen samples were thawed at room temperature and stored under refrigeration for determination of fibrinolytic activity. Fibrinolytic activity after frozen storage at both  $-70$  and  $-25^{\circ}\text{C}$  remained near nominal initial concentrations for at least 14 days. Furthermore, the

activity remained greater than 90% for up to 48 hours in all thawed samples subsequently stored at  $2^{\circ}\text{C}$  and was comparable to the activity of refrigerated solutions that had never been frozen. However, substantial and unacceptable losses of activity occurred after 72 hours under refrigeration whether previously frozen or not.<sup>2327</sup>

Genentech evaluated the activity of alteplase 1 mg/mL when reconstituted with sterile water for injection, packaged in glass vials, and stored frozen at  $-20^{\circ}\text{C}$  for 32 days, followed by thawing at room temperature. The frozen alteplase solution remained physically and chemically comparable to newly reconstituted alteplase for at least 8 hours at room temperature after thawing.<sup>2328</sup>

Alteplase (Genentech) 1 mg/mL in sterile water for injection packaged in polypropylene syringes was frozen at  $-20^{\circ}\text{C}$  for 6 months. Similar solutions in glass vials were frozen at  $-70^{\circ}\text{C}$  for 2 weeks, thawed and kept at  $23^{\circ}\text{C}$  for 24 hours, and then refrozen at  $-70^{\circ}\text{C}$  for 19 days. Little or no loss of alteplase bioactivity was found.<sup>2400</sup>

## Amifostine

AHFS 92:56

### Products

Amifostine is available in vials containing, in lyophilized form, 500 mg of amifostine on the anhydrous basis. The vial contents are reconstituted with 9.7 mL of sodium chloride 0.9% to yield a solution containing amifostine 50 mg/mL.<sup>1(4/08)</sup>

### pH

Approximately 7.<sup>234</sup>

### Trade Name(s)

Ethyol

### Administration

When used as a chemoprotectant in adults, amifostine is administered once daily as a 15-minute intravenous infusion.

The infusion is started 30 minutes before chemotherapy. When used as a radioprotectant in adults, amifostine is administered once daily as a 3-minute intravenous infusion started 15 to 30 minutes prior to radiation therapy. Patients should be well hydrated prior to intravenous infusion of amifostine and should maintain a supine position during the infusion. Only limited experience in administration to children or elderly patients is available.<sup>1(4/08)</sup> 4

### Stability

The intact vials may be stored at controlled room temperatures of 20 to 25°C. The manufacturer states that the reconstituted solution is chemically stable for 24 hours under refrigeration but only 5 hours at 25°C. The product should not be used if cloudiness or a precipitate is observed.<sup>1(4/08)</sup>

## Amikacin Sulfate

### AHFS 8:12.02

#### Products

Amikacin sulfate is available in a concentration of 250 mg/mL. Also present are sodium metabisulfite, sodium citrate, and sulfuric acid to adjust pH.<sup>1(12/07)</sup>

#### pH

4.5.<sup>291</sup> The range is 3.5 to 5.5.<sup>4</sup>

#### Osmolality

The osmolality of amikacin sulfate 500 mg was calculated for the following dilutions:<sup>1054</sup>

Diluent	Osmolality (mOsm/kg)	
	50 mL	100 mL
Dextrose 5%	353	319
Sodium chloride 0.9%	383	349

#### Sodium Content

The sodium content of amikacin sulfate 50 mg/mL is 0.064 mEq/mL; for the 250-mg/mL concentration, the sodium content is 0.319 mEq/mL.<sup>291</sup>

#### Administration

Amikacin sulfate may be administered by intramuscular injection and intravenous infusion; for intravenous infusion, 500 mg may be diluted in 100 to 200 mL of compatible infusion solution and administered to adults over 30 to 60 minutes. The diluent volume should be sufficient for drug infusion over 1 to 2 hours in infants and over 30 to 60 minutes in older children.<sup>1(12/07) 4</sup>

## Compatibility Information

### Solution Compatibility

#### Amikacin sulfate

Dextrose 5% in sodium chloride 0.225%	BA	BR	250 mg and 5 g	Compatible and stable for 24 hr at 25°C, 60 days at 4°C, 30 days at -15°C	292	C
Dextrose 5% in sodium chloride 0.45%	BA	BR	250 mg and 5 g	Compatible and stable for 24 hr at 25°C, 60 days at 4°C, 30 days at -15°C	292	C

#### Stability

Amikacin sulfate is supplied as a colorless to pale yellow or light straw-colored solution.<sup>4</sup> It was reported that aqueous solutions of amikacin sulfate in concentrations of 37.5 to 250 mg/mL retained greater than 90% for up to 36 months at 25°C, 12 months at 37°C, and 3 months at 56°C.<sup>291</sup> Aqueous solutions of amikacin sulfate are subject to color darkening because of air oxidation. However, this change in color has no effect on potency.<sup>291</sup>

#### Syringes

Amikacin sulfate (Bristol) 750 mg diluted with 1 mL of sodium chloride 0.9% to a final volume of 4 mL was stable, showing about a 2% loss when stored in polypropylene syringes (Becton Dickinson) for 48 hours at 23°C under fluorescent light.<sup>1159</sup>

#### Sorption

Amikacin sulfate was shown not to exhibit sorption to polyvinyl chloride (PVC) bags or sets and multilayer bags composed of polyethylene, polyamide, and polypropylene.<sup>2269</sup>

#### Central Venous Catheter

Amikacin sulfate (Apothecon) 1 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Delivery of the amikacin sulfate ranged from 92 to 98% of the initial concentration among the 3 lumens. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

Sodium chloride 0.9%	TR <sup>a</sup>	BR	5 g	Physically compatible. Stable for 24 hr at room temperature	518	C
Sodium chloride 0.9%	MG <sup>b</sup>	BR	4 g	Stable for 48 hr at 25°C in light	981	C
Sodium chloride 0.9%	AB <sup>a</sup>	BR	5 g	Visually compatible. Stable for 48 hr at 25°C in light and 4°C in dark	1541	C
Sodium lactate ½ M	BA	BR	250 mg and 5 g	Compatible and stable for 24 hr at 25°C, 60 days at 4°C, 30 days at -15°C	292	C
TPN #107 <sup>d</sup>			150 mg	Activity retained for 24 hr at 21°C	1326	C

<sup>a</sup> Tested in PVC containers.<sup>b</sup> Tested in glass containers.<sup>c</sup> Tested as a concentrate in glass vials.<sup>d</sup> Refer to Appendix for the composition of parenteral nutrition solutions. TPN indicates a 2-in-1 admixture.

**Additive Compatibility****Amikacin sulfate**

Test Drug	Mfr	Conc/L or %	Mfr	Conc/L or %	Test Solution	Remarks	Ref	C/I
Aminophylline	SE	5 g	BR	5 g	LR, NS, R, SL	Physically compatible and amikacin stable for 24 hr at 25°C. Aminophylline not analyzed	294	C
Aminophylline	SE	5 g	BR	5 g	D5LR, D5R, D5S, D5W, D10W	Over 10% amikacin loss after 8 hr but within 24 hr at 25°C. Aminophylline not analyzed	294	I
Amphotericin B	SQ	100 mg	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Precipitates immediately	293	I
Ampicillin sodium	BR	30 g	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Over 10% ampicillin loss in 4 hr at 25°C	293	I
Ascorbic acid	CO <sup>a</sup>	5 g	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and both stable for 24 hr at 25°C	294	C
Bleomycin sulfate	BR	20 and 30 units	BR	1.25 g	NS	Physically compatible. Bleomycin stable for 1 week at 4°C. Amikacin not tested	763	C
Calcium chloride	UP	1 g	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and both stable for 24 hr at 25°C	294	C
Calcium gluconate	UP	500 mg	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and both stable for 24 hr at 25°C	294	C
Cefazolin sodium	LI	20 g	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Both drugs stable for 8 hr at 25°C. Turbidity observed at 24 hr	293	I
Cefepime HCl	BR	40 g	BR	6 g	D5W, NS	Visually compatible with 6% cefepime loss in 24 hr at room temperature and 4% loss in 7 days at 5°C. No amikacin loss	1681	C
Cefotaxime sodium	RS	50 mg	BR	25 mg	D5W	33% loss of amikacin in 2 hr at 22°C	504	I
Cefotaxime sodium	RS	50 mg	BR	15 mg	D5W	Under 8% loss of amikacin in 24 hr at 22°C	504	C
Cefoxitin sodium	MSD	5 g	BR	5 g	D5S	9% cefoxitin loss at 25°C and none at 5°C in 48 hr. No amikacin loss at 25°C and 1% at 5°C in 48 hr	308	C
Ceftazidime	GL	50 mg	BR	25 mg	D5W	28% loss of amikacin in 2 hr at 22°C	504	I
Ceftazidime	GL	50 mg	BR	15 mg	D5W	17% loss of amikacin in 24 hr at 22°C	504	I
Ceftriaxone sodium	RC	100 mg	BR	15 and 25 mg	D5W	6% loss of amikacin in 24 hr at 22°C	504	C
Chloramphenicol sodium succinate	PD	10 g	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and both stable for 24 hr at 25°C	293	C
Chlorothiazide sodium	MSD	10 mg	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Precipitate forms within 4 hr at 25°C	294	I
Ciprofloxacin	MI	1.6 g	BR	4.1 g	D5W, NS	Visually compatible and both stable for 48 hr at 25°C under fluorescent light	1541	C
Ciprofloxacin	BAY	2 g	APC	4.9 g	D5W	Visually compatible with no loss of ciprofloxacin in 24 hr at 22°C under fluorescent light. Amikacin not tested	2413	C
Clindamycin phosphate	UP	6 g	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and amikacin stable for 24 hr at 25°C. Clindamycin not analyzed	293	C

**Additive Compatibility (Cont.)**

Test Drug	Mfr	Conc/L or %	Mfr	Conc/L or %	Test Solution	Remarks	Ref	C/I
Clindamycin phosphate	UP	9 g	BR	4 g	D5W, NS <sup>b</sup>	Both stable for 48 hr at 25°C under fluorescent light	981	C
Cloxacillin sodium	BR	10 g	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and both stable for 24 hr at 25°C	293	C
Colistimethate sodium	WC	500 mg	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and amikacin stable for 24 hr at 25°C. Colistimethate not analyzed	293	C
Dexamethasone sodium phosphate	MSD	40 mg	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and both stable for 24 hr at 25°C	294	C
Dexamethasone sodium phosphate	MSD	40 mg	BR	5 g	D2.5S	16% dexamethasone loss in 4 hr at 25°C	294	I
Dimenhydrinate	SE	100 mg	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and both stable for 24 hr at 25°C	294	C
Diphenhydramine HCl	PD	100 mg	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and both stable for 24 hr at 25°C	294	C
Epinephrine HCl	PD	2.5 mg	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and both stable for 24 hr at 25°C	294	C
Fluconazole	PF	1 g	BR	2.5 g	D5W	Visually compatible with no fluconazole loss in 72 hr at 25°C under fluorescent light. Amikacin not tested	1677	C
Furosemide	HO	160 mg	BR	2 g	D5W, NS	Transient cloudiness, then visually compatible for 24 hr at 21°C	876	?
Heparin sodium	AB	30,000 units	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Precipitates immediately	294	I
Hyaluronidase	SE	150 units	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and amikacin stable for 24 hr at 25°C. Hyaluronidase not analyzed	294	C
Hydrocortisone sodium succinate	UP	200 mg	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and both stable for 24 hr at 25°C	294	C
Lincomycin HCl	UP	10 g	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and both stable for 24 hr at 25°C	293	C
Mannitol	BA	20%	BR	250 mg and 5 g		Compatible and stable for 24 hr at 25°C, 60 days at 4°C, 30 days at -15°C	292	C
Norepinephrine bitartrate	WI	8 mg	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and both stable for 24 hr at 25°C	294	C
Oxacillin sodium	BR	2 g	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R	Physically compatible and both stable for 24 hr at 25°C	293	C
Oxacillin sodium	BR	2 g	BR	5 g	NR, SL	Oxacillin stable for 8 hr at 25°C. Over 10% loss in 24 hr	293	I
Penicillin G potassium	LI	20 million units	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and both stable for 24 hr at 25°C	293	C
Pentobarbital sodium	AB	100 mg	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and both stable for 24 hr at 25°C	294	C
Phenobarbital sodium	LI	300 mg	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and both stable for 24 hr at 25°C	294	C
Phenytoin sodium	PD	250 mg	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Precipitates immediately	294	I

**Additive Compatibility (Cont.)**

Test Drug	Mfr	Conc/L or %	Mfr	Conc/L or %	Test Solution	Remarks	Ref	C/I
Phytonadione	MSD	200 mg	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and amikacin stable for 24 hr at 25°C. Phytonadione not analyzed	294	C
Polymyxin B sulfate	BW	200 mg	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and amikacin stable for 24 hr at 25°C. Polymyxin not analyzed	293	C
Potassium chloride	LI	3 g	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and both stable for 24 hr at 25°C	294	C
Prochlorperazine edisylate	SKF	20 mg	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and both stable for 24 hr at 25°C	294	C
Promethazine HCl	WY	100 mg	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and both stable for 24 hr at 25°C	294	C
Ranitidine HCl	GL	100 mg	BR	1 g	D5W	Physically compatible for 24 hr at ambient temperature in light	1151	C
Ranitidine HCl	GL	50 mg and 2 g		2.5 g	D5W	Physically compatible. Ranitidine stable for 24 hr at 25°C. Amikacin not tested	1515	C
Sodium bicarbonate	BR	15 g	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and both stable for 24 hr at 25°C	294	C
Succinylcholine chloride	SQ	2 g	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and both stable for 24 hr at 25°C	294	C
Vancomycin HCl	LI	2 g	BR	5 g	D5LR, D5R, D5S, D5W, D10W, LR, NS, R, SL	Physically compatible and amikacin stable for 24 hr at 25°C. Vancomycin not tested	293	C
Verapamil HCl	KN	80 mg	BR	2 g	D5W, NS	Physically compatible for 24 hr	764	C

<sup>a</sup> Present as calcium ascorbate.

<sup>b</sup> Tested in glass containers.

**Drugs in Syringe Compatibility****Amikacin sulfate**

Test Drug	Mfr	Amt	Mfr	Amt	Remarks	Ref	C/I
Caffeine citrate		20 mg/1 mL	BED	250 mg/1 mL	Visually compatible for 4 hr at 25°C	2440	C
Clindamycin phosphate	UP	900 mg/6 mL	BR	750 mg/4 mL <sup>a</sup>	Physically compatible with little loss of either drug in 48 hr at 25°C	1159	C
Doxapram HCl	RB	400 mg/20 mL		100 mg/2 mL	Physically compatible with no doxapram loss in 24 hr	1177	C
Heparin sodium		2500 units/1 mL		100 mg	Turbidity or precipitate forms within 5 min	1053	I
Pantoprazole sodium	<sup>b</sup>	4 mg/1 mL		250 mg/1 mL	Precipitates	2574	I

<sup>a</sup> Diluted to 4 mL with 1 mL of sodium chloride 0.9%.

<sup>b</sup> Test performed using the formulation WITHOUT edetate disodium.

<sup>a</sup> Tested in dextrose 5%.<sup>b</sup> Tested in sodium chloride 0.9%.<sup>c</sup> Tested in both dextrose 5% and sodium chloride 0.9%.<sup>d</sup> Tested in Ringer's injection, lactated.<sup>e</sup> Tested in sodium chloride 0.45%.<sup>f</sup> Tested in dextrose 5% with albumin human 2 mg/mL.<sup>g</sup> Lyophilized formulation tested.<sup>h</sup> Refer to Appendix for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.<sup>i</sup> Run at 21 mL/hr.

## Y-Site Injection Compatibility (1:1 Mixture) (Cont.)

- <sup>j</sup> Given over 30 minutes by syringe pump.
- <sup>k</sup> Run at 94 mL/hr.
- <sup>l</sup> Run at 10 mL/hr.
- <sup>m</sup> Given over one hour by syringe pump.
- <sup>n</sup> Tested in sterile water for injection.
- <sup>o</sup> Injected via Y-site into an administration set running azithromycin.
- <sup>p</sup> Piperacillin component. Piperacillin in an 8:1 fixed-ratio concentration with tazobactam.
- <sup>q</sup> Test performed using the formulation WITH edetate disodium.
- <sup>r</sup> Test performed using the formulation WITHOUT edetate disodium.
- <sup>s</sup> Ceftolozane component. Ceftolozane in a 2:1 fixed-ratio concentration with tazobactam.
- <sup>t</sup> Meropenem component. Meropenem in a 1:1 fixed-ratio concentration with vaborbactam.
- <sup>u</sup> Ceftazidime component. Ceftazidime in a 4:1 fixed-ratio concentration with avibactam.
- <sup>v</sup> Tested in dextrose 5%, sodium chloride 0.9%, and Ringer's injection, lactated.
- <sup>w</sup> Salt not specified.

## Additional Compatibility Information

### *β-Lactam Antibiotics*

In common with other aminoglycoside antibiotics, amikacin activity may be impaired by  $\beta$ -lactam antibiotics. This inactivation is dependent on concentration, temperature, and time of exposure. However, amikacin appears to be less affected by the  $\beta$ -lactam antibiotics than other aminoglycosides such as gentamicin and tobramycin.<sup>68 574 575 654 740 816 824 973 1052</sup>

The clinical significance of these interactions appears to be primarily confined to patients with renal failure.<sup>218 334 361 364 616 816 847</sup> Literature reports of greatly reduced aminoglycoside levels in such patients have appeared frequently.<sup>363 365 366 367 614 615 962</sup> In addition, the interaction may be clinically important if assays for aminoglycoside levels in serum are sufficiently delayed.<sup>576 618 814 824 847 1052</sup>

Most authors believe that in vitro mixing of penicillins with aminoglycoside antibiotics should be avoided but that clinical use of the drugs in combination can be of great value. It is generally recommended that the drugs be given separately in such combined therapy.<sup>157 218 222 224 361 364 368 369 370</sup>

### *Peritoneal Dialysis Solutions*

Amikacin base (Bristol) 10 and 50 mg/L in peritoneal dialysis concentrate with 50% dextrose (McGaw) retained about 70% of initial activity in 7 hours and about 40 to 50% in 24 hours at room temperature.<sup>1044</sup>

Amikacin sulfate (Bristol) 25 mcg/mL combined separately with the cephalosporins cefazolin sodium (Lilly) and ceftaxime (MSD) at a concentration of 125 mcg/mL in peritoneal dialysis solution (Dianeal 1.5%) exhibited enhanced rates of lethality to *Staphylococcus aureus*, *Escherichia coli*, and *Pseudomonas aeruginosa* compared to any of the drugs alone.<sup>1623</sup>

## Amino Acids

### AHFS 40:20

#### Products

Amino acids are supplied in a variety of concentrations and sizes, both alone and in kits with dextrose 50% injection. For components, concentrations, and characteristics, see the labeling for the individual products.

#### Administration

Parenteral nutrition solutions composed of amino acids and high-concentration dextrose, which are strongly hypertonic, may be safely administered only through an indwelling intravenous catheter with the tip in the superior vena cava; they are used for severely depleted patients or those requiring long-term therapy.<sup>3267 3268</sup> For moderately depleted patients in whom the central venous route is not indicated, parenteral nutrition solutions with dextrose concentrations of 5 to 10%, which are substantially less hypertonic, may be administered peripherally.<sup>3267 3268</sup>

It has been recommended that administration sets used to administer lipid emulsions be changed within 24 hours of initiating infusion because of the potential for bacterial and fungal contamination.<sup>2342</sup>

For non-lipid-containing (TPN, 2-in-1) parenteral nutrition, 0.22- $\mu$ m filters, preferably endotoxin retaining, are recommended; for lipid-containing (TNA, 3-in-1, AIO) parenteral nutrition, 1.2- $\mu$ m filters are recommended.<sup>2346 3259</sup>

#### Stability

Solution containers should be visually inspected for cloudiness, haze, discoloration, precipitates, and bottle cracks and checked for the presence of vacuum before mixing and prior to administration. Only clear solutions should be administered. It is also recommended that the containers be protected from light until ready for use and from extremes of temperature such as freezing or over 40°C. Because of the risk of microbiological contamination, manufacturers recommend storing mixed parenteral nutrition solutions for as little time as possible after preparation. Administration of a single bottle should not exceed 24 hours.

A study of the original FreAmine showed that the mixed solution was stable at 4°C for 12 weeks. Increased temperature enhanced degradation. Decomposition due to the Maillard reaction is visible as a color change from the clear, light, pale yellow of the freshly prepared solution to yellow to red to dark brown. It was noted that the possibility of microbiological contamination limits the desirable storage time. It was recommended that solutions be stored under refrigeration and used as soon as possible after mixing.<sup>186</sup>

The previous study did not report on the stability of tryptophan because of variable and nonreproducible results.<sup>186</sup> In another study, it was shown that the tryptophan content of the original FreAmine was reduced approximately 20% by the presence of the sodium bisulfite 0.1% antioxidant.<sup>187</sup>

An evaluation of amino acid 4.25% injection with dextrose 25% (prepared from FreAmine II 8.5%), without additional additives, stored at 4°C for 2 weeks showed little or no change in the concentrations of amino acids, including tryptophan, as well as pH. Particle counts were also normal over the period. When stored at 25°C, approximately 6% tryptophan loss occurred, but no other changes were observed.<sup>581</sup>

In contrast, parenteral nutrition solutions composed of amino acids solution with ethanol and vitamins (Amino-fusin, Pfrimmer) along with dextrose and a variety of electrolytes exhibited a darkening of color on storage at 37, 25, and 5°C for 60 days. The rate of color change was less at the lowest temperature. A loss of ascorbic acid in the mixture was also demonstrated and was shown to be associated with the color changes. The rate of ascorbic acid decomposition was dependent on air space in the container and storage temperature. In addition, fine white crystals of calcium phosphate precipitated on day 12 at 25 and 37°C and on day 25 at 5°C.<sup>580</sup>

A photoreaction of the L-tryptophan in Nephramine essential amino acid injection was reported. The L-tryptophan in combination with bisulfite stabilizer, oxygen, and light yielded an indigo blue color. Although no toxicity was associated with the L-tryptophan degradation and blue color formation, it was recommended that Nephramine remain in its original carton until ready to be mixed with dextrose and that Nephramine mixtures be covered with amber, UV-light-resistant bags to retard the formation of the blue color. It was further noted that a slightly blue solution need not be changed for a colorless one, nor is it necessary to change a slightly blue filter for a white one.<sup>579</sup> However, it has been emphasized that the clinical importance of this reaction is largely undetermined and may not be entirely benign.<sup>1055</sup>

The effects of photoirradiation on a FreAmine II–dextrose 10% parenteral nutrition solution containing 1 mL/500 mL of multivitamins (USV) were evaluated. During simulated continuous administration to an infant at 0.156 mL/min, the amino acids did not change when the bottle, infusion tubing, and collection bottle were shielded with foil. Only 20 cm of tubing in the incubator was exposed to light. However, if the flow was stopped, a marked reduction in methionine (40%), tryptophan (44%), and histidine (22%) occurred in the solution exposed to light for 24 hours. In a similar solution without vitamins, only the tryptophan concentration decreased. The difference was attributed to the presence of riboflavin, a photosensitizer. The authors recommended administering the multivitamin separately and shielding from light.<sup>833</sup>

The stability of amino acids in a parenteral nutrition solution composed of amino acids 3.5%, dextrose 25%, and electrolytes in polyvinyl chloride (PVC) bags was assessed at 4 and 25°C over 30 days. No significant decreases of the amino acids occurred in the refrigerated samples. However, the sample stored at room temperature showed significant losses of methionine (10.2%) and arginine (8.2%) in 30 days.<sup>1057</sup>

The long-term stability of the components of a parenteral nutrition solution composed of amino acids, dextrose, electrolytes, and trace metals in PVC bags was determined over a 6-month period of storage at 4°C. None of the amino acids decomposed more than 10% during the first 2 months. However, at 6 months, all of the amino acids except tyrosine, lysine, and histidine had degraded by more than 10%; some losses exceeded 25%. The dextrose, electrolytes, and trace elements remained constant for the 6-month period. Water loss through the PVC bag was only 0.2%. Visually the color remained unchanged.<sup>1058</sup>

The long-term stability of the components of 6 parenteral nutrition solutions containing variable amounts of amino acids, dextrose, electrolytes, trace elements, and vitamins, stored in PVC bags at 4 and 25°C, was evaluated. No significant changes to the amino acids, dextrose, electrolytes, or trace elements were noted during 28 days.<sup>1063</sup>

### Peroxide Formation

Potentially toxic peroxide is generated in parenteral nutrition admixtures as a reaction between oxygen and various components catalyzed by riboflavin in the presence of light. This is particularly true in neonatal formulations.<sup>1650 1653 1947 2306 2309 2316</sup> Exposure of a neonatal parenteral nutrition admixture to ambient light resulted in the formation of peroxide concentrations up to 300 µM. Light protection from compounding through administration has been recommended as a more achievable approach to reduce the formation of peroxide than avoiding contact with oxygen.<sup>2316</sup>

Exposure of parenteral nutrition admixtures to light during phototherapy has been shown to generate substantially larger amounts of hydrogen peroxide.<sup>2310</sup> In a study of the rate of hydrogen peroxide formation in a TrophAmine 1%-based parenteral nutrition admixture exposed to light, levels of peroxide increased linearly for about 8 hours and then reached a plateau at about 940 µM. A similar solution kept in the dark did not generate any detectable peroxide. A hydrogen peroxide concentration of as little as 25 µM has been shown to be lethal to 90% of human cells in culture. The authors speculated that additive hepatic oxidant injury over time might increase hepatic dysfunction as the duration of exposure to parenteral nutrition increases. The presence of sulfite antioxidants in the amino

acids helps to reduce the formation of hydrogen peroxide, but the antioxidants are present in insufficient quantities to offer adequate protection. Shielding parenteral nutrition admixtures from light was recommended for neonatal administration.<sup>2309</sup>

The formation of toxic peroxides due to exposure of parenteral nutrition admixtures to light was reduced substantially by using colored administration sets. Both 2-in-1 and 3-in-1 parenteral nutrition admixtures exhibited little protection from peroxide formation when only the bag was shielded from light. Peroxide formation was 2 to 3 times higher using light-protected bags with clear tubing when compared to colored tubing. Shielding the parenteral nutrition bags from light and using black, yellow, or orange tubing would reduce peroxide loads down to about 100 µM.<sup>2306</sup>

### Freezing Solutions

The acceptability of frozen storage of some parenteral nutrition solutions has been determined. Parenteral nutrition solutions composed of equal parts of Travasol 8.5% with electrolytes and dextrose 70% injection (final concentrations of amino acids and dextrose were 4.25 and 35%, respectively), in PVC containers were stored frozen at -20°C for 60 days. Both overnight room temperature thawing and 30-minute microwave thawing were utilized. The results indicated that, with either thawing technique, the amino acids, electrolytes, and dextrose were unchanged after 60 days of frozen storage and subsequent thawing.<sup>578</sup>

### Plasticizer Leaching

A parenteral nutrition solution containing an amino acid solution, dextrose, and electrolytes in a PVC bag did not leach measurable quantities of diethylhexyl phthalate (DEHP) plasticizer during 21 days of storage at 4 and 25°C. However, addition of fat emulsion 10 or 20% to the formula caused detectable leaching of DEHP from the PVC containers stored for 48 hours. Higher DEHP levels were found in the 25°C samples than in the 4°C samples. The authors recommended limiting the use of lipid-containing parenteral nutrition admixtures to 24 to 36 hours. Use of non-PVC containers and tubing is another option to eliminate the problem of plasticizer leaching.<sup>1430</sup>

## Compatibility Information

Iron dextran	FI	100 mg	TR		TPN #31 to #33 <sup>a</sup>	Physically compatible with minimal changes to iron dextran and amino acids for 18 hr at room temperature	692	C
Iron dextran	FI	50 mg			TNA #122 <sup>a</sup>	Lipid oiling out in 18 to 19 hr with formation of yellow-brown layer	1383	I
Iron dextran	FI				TNA #159 to #166 <sup>a</sup>	Physically compatible with no change in particle size distribution in 48 hr at 4 and 25°C	1648	C
Iron dextran	SCN	10 mg			TPN #207, #208 <sup>a</sup>	Rust-colored precipitate forms in 12 hr at 19°C protected from sunlight	2103	I

**Additive Compatibility (Cont.)**

Test Drug	Mfr	Conc/L or %	Mfr	Conc/L or %	Test Solution	Remarks	Ref	C/I
Iron dextran	SCN	10 mg			TPN #209 <sup>a</sup>	Rust-colored precipitate forms in some samples in 18 to 24 hr at 19°C protected from sunlight	2103	I
Iron dextran	SCN	10 mg			TPN #210 <sup>a</sup>	Visually compatible for 48 hr at 19°C protected from sunlight. Trace iron precipitation found after 48 hr	2103	?
Iron dextran	SCN	10 mg			TPN #211 <sup>a</sup>	Visually compatible for 48 hr at 19°C protected from sunlight. No iron precipitation found after 48 hr	2103	C
Isoproterenol HCl	WI	2 mg	MG		AA 4.25%, D 25%	No increase in particulate matter in 24 hr at 4°C	349	C
Lidocaine HCl	AST	1 g	MG		AA 4.25%, D 25%	No increase in particulate matter in 24 hr at 4°C	349	C
Meperidine HCl	WI	100 mg			TPN #71 <sup>a, g</sup>	Physically compatible with no meperidine loss in 36 hr at 22°C	1000	C
Methotrexate sodium	LE	50 mg	MG		AA 4.25%, D 25%	No increase in particulate matter in 24 hr at 4°C	349	C
Methylodopate HCl	MSD	500 mg	MG		AA 4.25%, D 25%	No increase in particulate matter in 24 hr at 4°C	349	C
Methylprednisolone sodium succinate	UP	250 mg	MG		AA 4.25%, D 25%	No increase in particulate matter in 24 hr at 4°C	349	C
Methylprednisolone sodium succinate	PHU	25, 63, 125 mg			TNA #237 <sup>a, i</sup>	Physically compatible with no substantial change in lipid particle size. Variable assay results, but <10% change in drug concentration and <8% change in TNA components after 7 days at 4°C, followed by 24 hr at ambient temperature and light	2347	C
Methylprednisolone sodium succinate	PHU	25, 63, 125 mg			TPN #236 <sup>a, i</sup>	Variable assay results, but less than 10% change in drug concentration and less than 12% change in TPN components after 7 days at 4°C, followed by 24 hr at ambient temperature and light	2347	C
Metoclopramide HCl	RB	5 and 20 mg	TR		AA 2.75%, D 25%, electrolytes	Metoclopramide chemically stable for 72 hr at room temperature	854	C
Metoclopramide HCl	RB	5 mg			TPN #89 <sup>a</sup>	Physically compatible with no metoclopramide loss in 24 hr and 10% loss in 48 hr at 25°C	1167	C
Metoclopramide HCl	RB	20 mg			TPN #89 <sup>a</sup>	Physically compatible with no metoclopramide loss in 72 hr at 25°C	1167	C
Metoclopramide HCl	RB	5 mg			TPN #90 <sup>a</sup>	Physically compatible with no metoclopramide loss in 72 hr at 25°C	1167	C
Metoclopramide HCl	RB	20 mg			TPN #90 <sup>a</sup>	Physically compatible with 3% metoclopramide loss in 72 hr at 25°C	1167	C
Midazolam HCl	RC	600 mg to 1 g			TPN #174 to #176 <sup>a</sup>	Precipitates immediately	1624	I
Midazolam HCl	RC	100 and 500 mg			TPN #174 to #176 <sup>a</sup>	Visually compatible with no midazolam loss and less than 10% loss of any amino acid in 5 hr at 22°C	1624	C
Morphine sulfate	LI	100 mg			TPN #71 <sup>a, g</sup>	Physically compatible with no morphine loss in 36 hr at 22°C	1000	C
Multivitamins	USV	1 vial	TR		AA 4.25%, D 25%	No loss of thiamine HCl in 22 hr at 30°C	843	C
Multivitamins (M.V.I. Pediatric)	ROR	5 mL			AA 2%, D 12.5%, electrolytes	7% phytonadione loss in 4 hr and 27% loss in 24 hr under ambient temperature and light	1815	I
Multivitamins	LY	10 mL	AB <sup>g, h, i</sup>		AA 2.5%, D 25%	All vitamins stable for 24 hr at 4°C	926	C

## Additive Compatibility (Cont.)

Test Drug	Mfr	Conc/L or %	Mfr	Conc/L or %	Test Solution	Remarks	Ref	C/I
Multivitamins	LY	10 mL	MG <sup>g h i</sup>		AA 4.25%, D 25%	All vitamins stable for 24 hr at 4°C	926	C
Nafcillin sodium		1 and 2 g			TPN #107 <sup>a</sup>	Nafcillin activity retained for 24 hr at 21°C	1326	C
Norepinephrine bitartrate	WI	4 mg	MG		AA 4.25%, D 25%	No increase in particulate matter in 24 hr at 4°C	349	C
Octreotide acetate	SZ	1.5 mg			TPN #119, #120 <sup>a h</sup>	Little octreotide loss over 48 hr at room temperature in ambient room light	1373	C
Octreotide acetate	SZ	450 mcg			TNA #139 <sup>a g i</sup>	Physically compatible with no change in lipid particle size in 48 hr at 22°C under fluorescent light and 7 days at 4°C. Octreotide activity highly variable	1540	?
Ondansetron HCl	GL	0.03 and 0.3 g			TNA #190 <sup>a</sup>	Physically compatible with no ondansetron loss in 48 hr at 24°C in light	1766	C
Oxacillin sodium	BR	500 mg	MG		AA 4.25%, D 25%	No increase in particulate matter in 24 hr at 4°C	349	C
Pantoprazole sodium	ALT <sup>k</sup>	13.3 mg			TPN #265 <sup>a</sup>	Yellow discoloration and drug losses of 12% in 3 hr at room temperature in dark	2789	I
Penicillin G potassium	SQ	5 million units	MG		TPN #21 <sup>a</sup>	Activity retained for 24 hr at 4 and 25°C	87	C
Penicillin G potassium	LI	1 million units	MG		AA 4.25%, D 25%	No increase in particulate matter in 24 hr at 4°C	349	C
Penicillin G potassium	AY	25 million units	TR		TPN #22 <sup>a</sup>	Physically compatible with no loss of activity in 24 hr at 22°C in dark	837	C
Penicillin G potassium		2 g			TPN #107 <sup>a</sup>	Activity retained for 24 hr at 21°C	1326	C
Penicillin G sodium		2 g			TPN #107 <sup>a</sup>	Activity retained for 24 hr at 21°C	1326	C
Phytonadione	MSD	10 mg	MG		AA 4.25%, D 25%	No increase in particulate matter in 24 hr at 4°C	349	C
Polymyxin B sulfate	NOV	40 mg			TPN #52, #53 <sup>a</sup>	Physically compatible with no polymyxin loss in 24 hr at 29°C	440	C
Ranitidine HCl	GL	83, 167, 250 mg			TPN #58 <sup>a</sup>	10% ranitidine loss in 48 hr at 23°C	997	C
Ranitidine HCl	GL	50 and 100 mg			TPN #59, #60 <sup>a h</sup>	No color change and 7 to 9% ranitidine loss in 24 hr at 24°C in light. Amino acids unaffected. Darkened color and 10 to 12% ranitidine loss in 48 hr	1010	C
Ranitidine HCl	GL	50 and 100 mg			TNA #92 <sup>a i</sup>	7 to 10% ranitidine loss in 12 hr and 20 to 28% loss in 24 hr at 23°C in light	1183	I
Ranitidine HCl	GL	50 and 100 mg			TPN #117 <sup>a</sup>	Physically compatible and 5% ranitidine loss in 48 hr refrigerated and at 25°C	1360	C
Ranitidine HCl	GL	50 and 100 mg			TNA #118 <sup>a</sup>	Physically compatible. 6 to 10% ranitidine loss in 36 hr under refrigeration and at 25°C	1360	C
Ranitidine HCl	GL	75 mg			TNA #197 to #200 <sup>a</sup>	Physically compatible with 7% or less ranitidine loss in 24 hr at 22°C in light. About 15% loss in 48 hr	1921	C
Ranitidine HCl	GL	75 mg			TPN #196 <sup>a</sup>	Physically compatible with 7% or less ranitidine loss in 24 hr at 22°C in light. About 12% loss in 48 hr	1921	C
Ranitidine HCl		200 mg			TNA #245 <sup>a</sup>	No ranitidine loss and no lipid change in 24 hr at room temperature	486	C
Ranitidine HCl	GL	72 mg			TNA #246 <sup>a</sup>	Less than 7% ranitidine loss and no change in emulsion integrity in 14 days at 4°C	501	C

**Additive Compatibility (Cont.)**

Test Drug	Mfr	Conc/L or %	Mfr	Conc/L or %	Test Solution	Remarks	Ref	C/I
Ranitidine HCl	GL	72 mg			TPN #247 <sup>a</sup>	2% ranitidine loss in 14 days at 4°C	501	C
Sodium bicarbonate		50 and 150 mEq			TPN #62 to #65	Physically compatible with 10% or less carbon dioxide loss and unchanged pH in 7 days at 25°C protected from light	1011	C
Sodium bicarbonate		100 mEq			TPN #66 to #68 <sup>a</sup>	Physically compatible with 10% or less carbon dioxide loss and unchanged pH in 7 days at 25°C protected from light	1011	C
Tacrolimus	FUJ	100 mg			TPN #201 <sup>a, g</sup>	Visually compatible with no loss in 24 hr at 24°C	1922	C
Tobramycin sulfate	LI	80 mg	MG		AA 4.25%, D 25%	No increase in particulate matter in 24 hr at 4°C	349	C
Vancomycin HCl		400 mg			TPN #95, #96 <sup>a</sup>	Physically compatible and no vancomycin loss for 8 days at room temperature and refrigerated	1321	C
Vancomycin HCl		1 and 6 g			TPN #105, #106 <sup>a</sup>	Physically compatible with little or no vancomycin loss in 4 hr at 22°C	1325	C
Vancomycin HCl		200 mg			TPN #107 <sup>a</sup>	Activity retained for 24 hr at 21°C	1326	C
Vancomycin HCl	LI	500 mg and 1 g			TPN #202 <sup>a, h</sup>	Visually compatible and activity retained for 35 days at 4°C plus 24 hr at 22°C	1933	C

<sup>a</sup> Refer to Appendix for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>b</sup> Tested in a pediatric parenteral nutrition solution containing 150 mL of dextrose 5% and 30 mL of Vamin glucose with electrolytes and vitamins.

<sup>c</sup> Expressed as clindamycin base.

<sup>d</sup> TPN composed of amino acids (TrophAmine) 0.5 or 2.25% with dextrose 12.5%, vitamins, trace elements, magnesium sulfate, calcium gluconate, sodium chloride, potassium acetate, and heparin sodium.

<sup>e</sup> Delivered from a syringe through microbore tubing, T-connector, and a Teflon neonatal 24-gauge intravenous catheter.

<sup>f</sup> Tested in Vamin 14, Vamin 18, Vamin glucose, and Vamin N.

<sup>g</sup> Tested in glass containers.

<sup>h</sup> Tested in PVC containers.

<sup>i</sup> Tested in ethylene vinyl acetate containers.

<sup>j</sup> Concentration of fosphenytoin expressed in milligrams of phenytoin sodium equivalents (PE) per mL.

<sup>k</sup> Test performed using the formulation WITH edetate disodium.

<sup>l</sup> Tested in polyolefin bags.

<sup>m</sup> Imipenem component. Imipenem in a 1:1 fixed-ratio concentration with cilastatin.

<sup>n</sup> Not specified whether concentration refers to single component or combined components.

<sup>a</sup> Tested in dextrose 5%.

<sup>b</sup> Tested in sodium chloride 0.9%.

<sup>c</sup> Run at 21 mL/hr.

<sup>d</sup> Run at 94 mL/hr.

<sup>e</sup> Given over one hour by syringe pump.

<sup>f</sup> Run at 10 mL/hr.

<sup>g</sup> Refer to Appendix for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>h</sup> A 32.5-mL sample of parenteral nutrition solution and 50 mL of antibiotic in a minibottle.

<sup>i</sup> Given over five minutes by syringe pump.

<sup>j</sup> Given over 30 minutes by syringe pump.

<sup>k</sup> Tested in sterile water for injection.

<sup>l</sup> Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>m</sup> Given over 10 minutes by syringe pump.

<sup>n</sup> Tested in dextrose 5% infused at 1.2 mL/hr.

<sup>o</sup> Varying volumes to simulate varying administration rates.

<sup>p</sup> Ganciclovir sodium concentration after mixing was 0.83 mg/mL.

<sup>q</sup> Ganciclovir sodium concentration after mixing was 1.4 mg/mL.

<sup>r</sup> TrophAmine.

<sup>s</sup> Tested in Haemaccel (Behring).

<sup>t</sup> With albumin human 0.1%.

<sup>u</sup> Lyophilized formulation tested.

<sup>v</sup> Tested in Ringer's injection, lactated.

<sup>w</sup> Specific composition of the parenteral nutrition admixture not reported. TPN indicates a 2-in-1 admixture.

<sup>x</sup> Test performed using the formulation WITHOUT edetate disodium.

<sup>y</sup> Not specified whether concentration refers to single component or combined components.

<sup>z</sup> Piperacillin component. Piperacillin in an 8:1 fixed-ratio concentration with tazobactam.

<sup>aa</sup> Ampicillin component. Ampicillin in a 2:1 fixed-ratio concentration with sulbactam.

<sup>bb</sup> Trimethoprim component. Trimethoprim in a 1:5 fixed-ratio concentration with sulfamethoxazole.

<sup>cc</sup> Sodium carbonate-containing formulation tested.

## Additional Compatibility Information

### Multicomponent (3-in-1; TNA) Admixtures

Because of the potential benefits in terms of simplicity, efficiency, time, and cost savings, the concept of mixing amino acids, carbohydrates, electrolytes, fat emulsion, and other nutritional components together in the same container has been explored. Within limits, the feasibility of preparing such 3-in-1 parenteral nutrition admixtures has been demonstrated as long as a careful examination of the emulsion mixtures for signs of instability is performed prior to administration.

However, these 3-in-1 mixtures are very complex and inherently unstable. Emulsion stability is dependent on both zeta potential and van der Waals forces, influenced by the presence of dextrose.<sup>2029</sup> The ultimate stability of each unique mixture depends on numerous complicated factors, making definitive stability predictions impossible. Injury and death have resulted from administration of unrecognized precipitates in 3-in-1 parenteral nutrition admixtures.<sup>1769 1782 1783</sup> See the section on Calcium and Phosphate. In addition, the use of 3-in-1 admixtures is associated with a higher rate of catheter occlusion and reduced catheter life compared with giving the fat emulsion separately from the parenteral nutrition solution.<sup>705 1518 2194</sup>

The use of a 5- $\mu$ m inline filter for a 3-in-1 admixture (containing Travasol 8.5%, dextrose, Intralipid 10%, various electrolytes, vitamins, and trace elements) showed that fat, in the form of large globules or aggregates, comprised 99.4% of the filter contents. These authors recommend the use of an appropriate filter for preventing catheter occlusion with 3-in-1 admixtures.<sup>742</sup>

Using light microscopy, the presence of glass particles, talc, and plastic has been observed in administration line samples drawn from 20 adults receiving 3-in-1 parenteral nutrition admixtures and in 20 children receiving 2-in-1 admixtures with separate fat emulsion infusions. Particles ranged from 3 to 5  $\mu$ m to greater than 40  $\mu$ m and were more consistently seen in the pediatric admixtures. The authors suggested the use of inline filters given that particulate contamination is present, has no therapeutic value, and can be harmful.<sup>2458</sup>

Combining an amino acids–glucose parenteral nutrition solution containing various electrolytes with fat emulsion 20%, intravenous (Intralipid, Vitrum), resulted in a mixture which, although apparently stable for a limited time, ultimately exhibited a creaming phenomenon. Within 12 hours, a distinct 2-cm layer separated on the upper surface. Microscopic examination revealed aggregates believed to be clumps of fat droplets. Fewer and smaller aggregates were noted in the lower layer.<sup>560 561</sup>

Amino acids were reported to have no adverse effect on the emulsion stability of Intralipid 10%. In addition, the amino acids appeared to prevent the adverse impact of dextrose and to slow the flocculation and coalescence resulting from mono- and divalent cations. However, significant coalescence did result after a longer time. Therefore, it was recommended that such cations not be mixed with fat emulsion, intravenous.<sup>656</sup>

Three-in-one TNA admixtures prepared with Intralipid 20% and containing mono- and divalent ions as well as heparin

sodium 5 units/mL were found to undergo changes consistent with instability including fat particle shape and diameter changes as well as creaming and layering. The changes were evident within 48 hours at room temperature but were delayed to between 1 and 2 months when refrigerated.<sup>58</sup>

Travenol stated that 1:1:1 mixtures of amino acids 5.5, 8.5, or 10% (Travenol), fat emulsion 10 to 20% (Travenol), and dextrose 10 to 70% are physically stable but recommends administration within 24 hours. M.V.I.-12 3.3 mL/L and electrolytes may also be added to the admixtures up to the maximum amounts listed in Table 1.<sup>850</sup>

**Table 1. Maximum electrolyte amounts for Travenol 3-in-1 admixtures<sup>850</sup>**

Calcium	8.3 mEq/L
Magnesium	3.3 mEq/L
Sodium	23.3 mEq/L
Potassium	20 mEq/L
Chloride	23.3 mEq/L
Phosphate	20 mEq/L
Zinc	3.33 mg/L
Copper	1.33 mg/L
Manganese	0.33 mg/L
Chromium	13.33 mcg/L

The stability of mixtures of 1 L of Intralipid 20%, 1.5 L of Vamin glucose (amino acids with dextrose 10%), and 0.5 L of dextrose 10% with various electrolytes and vitamins was evaluated. Initial emulsion particle size was around 1  $\mu$ m. The mixture containing only monovalent cations was stable for at least 9 days at 4°C, with little change in particle size. The mixtures containing the divalent cations, such as calcium and magnesium, demonstrated much greater particle size increases, with mean diameters of around 3.3 to 3.5  $\mu$ m after 9 days at 4°C. After 48 hours of storage, however, these increases were more modest, around 1.5 to 1.85  $\mu$ m. After storage at 4°C for 48 hours followed by 24 hours at room temperature, few particles exceeded 5  $\mu$ m. It was found that the effect of particle aggregation caused by electrolytes demonstrates a critical concentration before the effect begins. For calcium and magnesium chlorides, the critical concentrations were 2.4 and 2.6 mmol/L, respectively. Sodium and potassium chloride had critical concentrations of 110 and 150 mmol/L, respectively. The rate of particle aggregation increased linearly with increasing electrolyte concentration. The quantity of emulsion in the mixture had a relatively small influence on stability, but higher concentrations exhibited a somewhat greater coalescence.<sup>892</sup>

Instability of the emulsion systems is manifested by (1) flocculation of oil droplets to form aggregates, producing a cream-like layer on top; or (2) coalescence of oil droplets, leading to an increase in the average droplet size and eventually a separation

of free oil. The lowering of pH and the adding of electrolytes can adversely affect the mechanical and electrical properties at the oil-water interface, eventually leading to flocculation and coalescence. Amino acids act as buffering agents and provide a protective effect on emulsion stability. Adding electrolytes, especially the divalent ions Mg<sup>++</sup> and Ca<sup>++</sup> in excess of 2.5 mmol/L, to simple fat emulsions will cause flocculation. But in mixed parenteral nutrition solutions, the stability of the emulsion will be enhanced, depending on the quantity and nature of the amino acids present. The authors recommended a careful examination of emulsion mixtures for signs of instability prior to administration.<sup>849</sup>

Good stability was reported for an amino acid 4% (Travenol), dextrose 14%, and fat emulsion 4% (Pharmacia) parenteral nutrition solution. The solution also contained electrolytes, vitamins, and heparin sodium 4000 units/L. The aqueous solution was prepared first, with the fat emulsion added subsequently. This procedure allowed visual inspection of the aqueous phase and reduced the risk of emulsion breakdown by the divalent cations. Sample mixtures were stored at 18 to 25 and 3 to 8°C for up to 5 days. They were evaluated visually and with a Coulter counter for particle size measurements. Both room temperature and refrigerated mixtures were stable for 48 hours. A marked increase in particle size was noted in the room temperature sample after 72 hours, but refrigeration delayed the changes. The authors' experience with over 1400 mixtures for administration to patients resulted in one emulsion creaming and another cracking, but the authors had no explanation for the failure of these particular emulsions.<sup>848</sup>

Six parenteral nutrition solutions having various concentrations of amino acids, dextrose, soybean oil emulsion (Kabi-Vitrum), electrolytes, and multivitamins were evaluated. All of the admixtures were stable for 1 week under refrigeration followed by 24 hours at room temperature, with no visible changes, changes in pH, or significant changes in particle size.<sup>1013</sup> However, other researchers questioned this interpretation of the results.<sup>1014 1015</sup>

The stability of 3-in-1 parenteral nutrition solutions prepared with 500 mL of Intralipid 20%, compared to Soyacal 20%, along with 500 or 1000 mL of FreAmine III 8.5% and 500 mL of dextrose 70% was reported. Also present were relatively large amounts of electrolytes and other additives. All mixtures were similarly stable for 28 days at 4°C followed by 5 days at 21 to 25°C, with little change in the emulsion. A slight white cream layer appeared after 5 days at 4°C but was easily redispersed with gentle agitation. The appearance of this cream layer did not statistically affect particle size distribution. The authors concluded that the emulsion mixture remained suitable for clinical use throughout the study period. The stability of other components was not evaluated.<sup>1019</sup>

The stability of 3-in-1 parenteral nutrition admixtures prepared with Liposyn II 10 and 20%, Aminosyn pH 6, and dextrose along with electrolytes, trace metals, and vitamins was reported. Thirty-one different combinations were evaluated. Samples were stored at: (1) 25°C for 1 day, (2) 5°C for 2 days followed by 30°C for 1 day, and (3) 5°C for 9 days followed by 25°C for 1 day. In all cases, there was no visual evidence of creaming, free oil droplets, and other signs of emulsion instability. Furthermore, little

or no change in the particle size or zeta potential (electrostatic surface charge of lipid particles) was found, indicating emulsion stability. The dextrose and amino acids remained stable over the 10-day storage period. The greatest change of an amino acid occurred with tryptophan, which lost 6% in 10 days. Vitamin stability was not tested.<sup>1025</sup>

The stability of 4 parenteral nutrition admixtures, ranging from 1 L each of amino acids 5.5% (Travenol), dextrose 10%, and fat emulsion 10% (Travenol) up to a "worst case" of 1 L each of amino acids 10% with electrolytes (Travenol), dextrose 70%, and fat emulsion 10% (Travenol) was reported. The admixtures were stored for 48 hours at 5 to 9°C followed by 24 hours at room temperature. There were no visible signs of creaming, flocculation, and free oil. The mean emulsion particle size remained within acceptable limits for all admixtures, and there were no significant changes in glucose, soybean oil, and amino acid concentrations. The authors noted that 2 factors were predominant in determining the stability of such admixtures: electrolyte concentrations and pH.<sup>1065</sup>

Several parenteral nutrition solutions containing amino acids (Travenol), glucose, and lipid, with and without electrolytes and trace elements, produced no visible flocculation or any significant change in mean emulsion particle size during 24 hours at room temperature.<sup>1066</sup>

The compatibility of 10 parenteral nutrition admixtures, evaluated over 96 hours while stored at 20 to 25°C in both glass bottles and ethylene vinyl acetate bags was reported. A slight creaming occurred in all admixtures, but the cream layer was easily redispersed with gentle shaking. No fat globules were visually apparent. The mean drop size was larger in the cream layer, but no globules were larger than 5 µm. Analyses of the concentrations of amino acids, dextrose, and electrolytes showed no changes over the study period. The authors concluded that such parenteral nutrition admixtures could be safely prepared as long as the component concentrations are within the ranges found in Table 2.<sup>1067</sup>

**Table 2. Range of component amounts for compatibility testing of 3-in-1 admixtures<sup>1067</sup>**

Vamin glucose or Vamin N (amino acids 7%)	1000 to 2000 mL
Dextrose 10 to 30%	100 to 550 mL
Intralipid 10 or 20%	500 to 1000 mL
Electrolyte (mmol/L)	
Sodium	20 to 70
Potassium	20 to 55
Calcium	2.3 to 2.9
Magnesium	1.1 to 3.1
Phosphorus	0 to 9.2
Chloride	27 to 71
Zinc	0.005 to 0.03

The stability of 8 parenteral nutrition admixtures with various ratios of amino acids, carbohydrates, and fat was reported. FreAmine III 8.5%, dextrose 70%, and Soyacal 10 and 20% (mixed in ratios of 2:1:1, 1:1:1, 1:1:½, and 1:1:¼, where 1 = 500 mL) were evaluated. Additive concentrations were high to stress the admixtures and represent maximum doses likely to be encountered clinically. (See Table 3.)

**Table 3. Range of component amounts for compatibility testing of 3-in-1 admixtures<sup>1068</sup>**

Sodium acetate	150 mEq
Sodium chloride	210 mEq
Potassium acetate	45 mEq
Potassium chloride	90 mEq
Potassium phosphate	15 mM
Calcium gluconate	20 mEq
Magnesium sulfate	36 mEq
Trace elements	present
Folic acid	5 mg
M.V.I.-12	10 mL

The admixtures were stored at 4°C for 14 days followed by 4 days at 22 to 25°C. After 24 hours, all admixtures developed a thin white cream layer, which readily redispersed on gentle agitation. No free oil droplets were observed. The mean particle diameter remained near the original size of the Soyacal throughout the study. Few particles were larger than 3 µm. Osmolality and pH also remained relatively unchanged.<sup>1068</sup>

Parenteral nutrition 3-in-1 admixtures with Aminosyn and Liposyn have been a problem. Standard admixtures were prepared using Aminosyn 7% 1000 mL, dextrose 50% 1000 mL, and Liposyn 10% 500 mL. Concentrated admixtures were prepared using Aminosyn 10% 500 mL, dextrose 70% 500 mL, and Liposyn 20% 500 mL. Vitamins and trace elements were added to the admixtures along with the following electrolytes (see Table 4).

**Table 4. Electrolyte amounts for compatibility testing of 3-in-1 admixtures<sup>1069</sup>**

Electrolyte	Standard Admixture	Concentrated Admixture
Sodium	125 mEq	75 mEq
Potassium	95 mEq	74 mEq
Magnesium	25 mEq	25 mEq
Calcium	28 mEq	28 mEq
Phosphate	37 mM	36 mM
Chloride	83 mEq	50 mEq

Samples of each admixture were: (1) stored at 4°C, (2) adjusted to pH 6.6 with sodium bicarbonate and stored at 4°C,

or (3) adjusted to pH 6.6 and stored at room temperature. The compatibility was evaluated for 3 weeks.

Visible signs of emulsion deterioration were evident by 96 hours in the standard admixture and by 48 hours in the concentrated admixture. Clear rings formed at the meniscus, becoming thicker, yellow, and oily over time. Free-floating oil was obvious in 3 weeks in the standard admixture and 1 week in the concentrated admixture. The samples adjusted to pH 6.6 developed visible deterioration later than the others. The authors indicated that pH may play a greater role than temperature in emulsion stability. However, precipitation (probably calcium phosphate and possibly carbonate) occurred in 36 hours in the pH 6.6 concentrated admixture but not the unadjusted (pH 5.5) samples. Mean particle counts increased for all samples over time but were greatest in the concentrated admixtures. The authors concluded that the concentrated admixtures were unsatisfactory for clinical use because of the early increase in particles and precipitation. Furthermore, they recommended that the standard admixtures be prepared immediately prior to use.<sup>1069</sup>

The physical stability of 10 parenteral nutrition admixtures with different amino acid sources was studied. The admixtures contained 500 mL each of dextrose 70%, fat emulsion 20% (Alpha Therapeutic), and amino acids in various concentrations from each manufacturer. Also present were standard electrolytes, trace elements, and vitamins. The admixtures were stored for 14 days at 4°C, followed by 4 days at 22 to 25°C. Slight creaming was evident in all admixtures but redispersed easily with agitation. Emulsion particles were uniform in size, showing no tendency to aggregate. No cracked emulsions occurred.<sup>1217</sup>

The stability of parenteral nutrition solutions containing amino acids, dextrose, and fat emulsion along with electrolytes, trace elements, and vitamins has been described. In one study the admixtures were stable for 24 hours at room temperature and for 8 days at 4°C. The visual appearance and particle size of the fat emulsion showed little change over the observation periods.<sup>1218</sup> In another study variable stability periods were found, depending on electrolyte concentrations. Stability ranged from 4 to 25 days at room temperature.<sup>1219</sup>

The effects of dilution, dextrose concentration, amino acids, and electrolytes on the physical stability of 3-in-1 parenteral nutrition admixtures prepared with Intralipid 10% or Travamulsion 10% was studied. Travamulsion was affected by dilution up to 1:14, exhibiting an increase in mean particle size, while Intralipid remained virtually unchanged for 24 hours at 25°C and for 72 hours at 4°C. At dextrose concentrations above 15%, fat droplets larger than 5 µm formed during storage for 24 hours at either 4°C or room temperature. The presence of amino acids increased the stability of the fat emulsions in the presence of dextrose. Fat droplets larger than 5 µm formed at a total electrolyte concentration above approximately 240 mmol/L (monovalent cation equivalent) for Travamulsion 10% and 156 mmol/L for Intralipid 10% in 24 hours at room temperature, although creaming or breaking of the emulsion was not observed visually.<sup>1221</sup>

The stability of 43 parenteral nutrition admixtures composed of various ratios of amino acid products, dextrose 10 to 70%, and 4 lipid emulsions 10 and 20% with electrolytes, trace elements,

and vitamins was studied. One group of admixtures included Travasol 5.5, 8.5, and 10%, FreAmine III 8.5 and 10%, Novamine 8.5 and 11.4%, Nephramine 5.4%, and RenAmine 6.5% with Liposyn II 10 and 20%. In another group, Aminosyn II 7, 8.5, and 10% was combined with Intralipid, Travamulsion, and Soyacal 10 and 20%. A third group consisted of Aminosyn II 7, 8.5, and 10% with electrolytes combined with the latter 3 lipid emulsions. The admixtures were stored for 24 hours at 25°C and for 9 days at 5°C followed by 24 hours at 25°C. A few admixtures containing FreAmine III and Novamine with Liposyn II developed faint yellow streaks after 10 days of storage. The streaks readily dispersed with gentle shaking, as did the creaming present in most admixtures. Other properties such as pH, zeta-potential, and osmolality underwent little change in all of the admixtures. Particle size increased fourfold in 1 admixture (Novamine 8.5%, dextrose 50%, and Liposyn II in a 1:1:1 ratio), which the authors noted signaled the onset of particle coalescence. Nevertheless, the authors concluded that all of the admixtures were stable for the storage conditions and time periods tested.<sup>1222</sup>

The stability of 24 parenteral nutrition admixtures composed of various ratios of Aminosyn II 7, 8.5, or 10%, dextrose, and Liposyn II 10 and 20% with electrolytes, trace elements, and vitamins was also studied. Four admixtures were stored for 24 hours at 25°C, 6 admixtures were stored for 2 days at 5°C followed by 1 day at 30°C, and 14 admixtures were stored for 9 days at 5°C followed by 1 day at 25°C. No visible instability was evident. Creaming was present in most admixtures but disappeared with gentle shaking. Other properties such as pH, zeta-potential, particle size, and potency of the amino acids and dextrose showed little or no change during storage.<sup>1223</sup>

The emulsion stability of 5 parenteral nutrition formulas (TNA #126 through #130 in Appendix) containing Liposyn II in concentrations ranging from 1.2 to 7.1% were reported. The parenteral nutrition solutions were prepared using simultaneous pumping of the components into empty containers (as with the Nutrimix compounder) and sequential pumping of the components (as with Automix compounders). The solutions were stored for 2 days at 5°C followed by 24 hours at 25°C. Similar results were obtained for both methods of preparation using visual assessment and oil globule size distribution.<sup>1426</sup>

The stability of 24 parenteral nutrition admixtures containing various concentrations of Aminosyn II, dextrose, and Liposyn II with a variety of electrolytes, trace elements, and multivitamins in dual-chamber, flexible, Nutrimix containers was studied as well. No instability was visible in the admixtures stored at 25°C for 24 hours or in those stored for 9 days at 5°C followed by 24 hours at 25°C. Creaming was observed, but neither particle coalescence nor free oil was noted. The pH, particle size distribution, and amino acid and dextrose concentrations remained acceptable during the observation period.<sup>1432</sup>

The physical stability of 10 parenteral nutrition formulas (TNA #149 through #158 in Appendix) containing TrophAmine and Intralipid 20%, Liposyn II 20%, and Nutrilipid 20% in varying concentrations with low and high electrolyte concentrations was studied. All test formulas were prepared with an automatic compounder and protected from light. TNA #149 through #156 were stored for 48 hours at 4°C followed by 24 hours at 21°C;

TNA #157 and #158 were stored for 24 hours at 4°C followed by 24 hours at 21°C. Although some minor creaming occurred in all formulas, it was completely reversible with agitation. No other changes were visible, and particle size analysis indicated little variation during the study period. The addition of cysteine hydrochloride 1 g/25 g of amino acids, alone or with L-carnitine 16 mg/g fat, to TNA #157 and #158 did not adversely affect the physical stability of 3-in-1 admixtures within the study period.<sup>1620</sup>

The physical stability of five 3-in-1 parenteral nutrition admixtures (TNA #167 through #171 in Appendix) was evaluated by visual observation, pH and osmolality determinations, and particle size distribution analysis. All 5 admixtures were physically stable for 90 days at 4°C. However, some irreversible flocculation occurred in all combinations after 180 days.<sup>1651</sup>

The stability of several parenteral nutrition formulas (TNA #159 through #166 in Appendix) with and without iron dextran 2 mg/L was studied. All formulas were physically compatible both visually and microscopically for 48 hours at 4 and 25°C, and particle size distribution remained unchanged. The order of mixing and deliberate agitation had no effect on physical compatibility.<sup>1648</sup>

The influence of 6 factors on the stability of fat emulsion in 45 different 3-in-1 parenteral nutrition mixtures was evaluated. The factors were amino acid concentration (2.5 to 7%); dextrose (5 to 20%); fat emulsion, intravenous (2 to 5%); monovalent cations (0 to 150 mEq/L); divalent cations (4 to 20 mEq/L); and trivalent cations from iron dextran (0 to 10 mg elemental iron/L). Although many formulations were unstable, visual examination could identify instability in only 65% of the samples. Electronic evaluation of particle size identified the remaining unstable mixtures. Furthermore, only the concentration of trivalent ferric ions significantly and consistently affected the emulsion stability during the 30-hour test period. Of the parenteral nutrition mixtures containing iron dextran, 16% were unstable, exhibiting emulsion cracking. The authors suggested that iron dextran should not be incorporated into 3-in-1 mixtures.<sup>1814</sup>

The compatibility of 8 parenteral nutrition admixtures, 4 with and 4 without electrolytes, comparing Liposyn II and Intralipid (TNA #250 through #257 in Appendix) was reported. The 3-in-1 admixtures were evaluated over 2 to 9 days at 4°C and then 24 hours at 25°C in ethylene vinyl acetate (EVA) bags. No substantial changes were noted in the fat particle sizes and no visual changes of emulsion breakage were observed. All admixtures tested had particle sizes in the 2- to 40- $\mu$ m range.<sup>2465</sup>

The stability of 3-in-1 parenteral nutrition admixtures prepared with Vamin 14 with electrolytes and containing either Lipofundin MCT/LCT 20% or Intralipid 20% was evaluated. The admixtures contained 66.7 mmol/L of monovalent and 6.7 mmol/L of divalent cations. Stability of the fat emulsion was evaluated after 2, 7, and 21 days at 4°C in EVA bags followed by 24 hours of room temperature to simulate infusion. Microscopy, Coulter counter, photon correlation spectroscopy, and laser diffractometry techniques were used to determine stability. Droplet size by microscopy was noted to increase to 18 to 20  $\mu$ m after 21 days in both of the admixtures with the Intralipid-containing admixture showing particles this large as early as day

2 and with Lipofundin MCT/LCT at day 7. The Coulter counter assessed particles greater than 2 µm to be approximately 1300 to 1500 with Lipofundin MCT/LCT and 37,000 in the Intralipid-containing admixtures immediately after their preparation. Heavy creaming with a thick firm layer was noted after 2 days with the Intralipid-containing admixture, making particle assessment difficult. The authors concluded that storage limitation of 2 days for the Intralipid-containing admixture and not more than 7 days for the Lipofundin-containing admixture appeared justified. They also noted that calcium and magnesium behaved identically in destabilizing fat emulsion with greater concentrations of divalent cations.<sup>867</sup>

The drop size of 3-in-1 parenteral nutrition solutions in drip chambers is variable, being altered by the constituents of the mixture. In one study, multivitamins (Multibionta, E. Merck) caused the greatest reductions in drop size, up to 37%. This change may affect the rate of delivery if the flow is estimated from drops per minute.<sup>1016</sup> Similarly, flow rates delivered by infusion controllers dependent on predictable drop size may be inaccurate. Flow rates up to 29% less than expected have been reported. Therefore, variable pressure volumetric pumps, which are independent of drop size, should be used rather than infusion controllers.<sup>1215</sup>

The physical instability of 3-in-1 total nutrient admixtures stored for 24 hours at room temperature was reported. The admixtures intended for use in neonates and infants were compounded with TrophAmine 2 to 3%, dextrose 18 to 24%, Liposyn II (Abbott) 2 to 3%, L-cysteine hydrochloride, and the following electrolytes in Table 5.

**Table 5. Incompatible electrolyte ranges in neonatal 3-in-1 admixtures<sup>2619</sup>**

Sodium	20 to 50 mEq/L
Potassium	13.3 to 40 mEq/L
Calcium chloride	20 to 26.6 mEq/L
Magnesium	3.4 to 5 mEq/L
Phosphates	6.7 to 15 mmol/L

The emulsion in the admixtures cracked and developed visible free oil within 24 hours after compounding. The incompatibility was considered to create a clinically significant risk of complications if administered. The authors determined that these 3-in-1 total nutrient admixtures containing these concentrations of electrolytes were unacceptable and should not be used.<sup>2619</sup>

Another evaluation of 3-in-1 total nutrient admixtures reported physical instabilities of several formulations evaluated over 7 days. The parenteral nutrition admixtures were prepared with dextrose 15% and Intralipos 4% (Fresenius Kabi) along with FreAmine 4.3%, NephroAmine 2.1%, TrophAmine 2.7%, Topanusol 5%, or HepatAmine 4%. Various electrolytes and other components were also present including sodium, potassium, calcium (salt form unspecified), magnesium, trace elements, vitamin K, and heparin. The admixtures were stored at 4°C and evaluated at 0, 3, and 7 days. After removal from

refrigeration, the samples were subjected to additional exposure to room temperature and temperatures exceeding 28°C for 24 to 48 hours. Flocculation was found in the admixtures prepared with FreAmine and with TrophAmine after 24 hours storage at room temperature, and after 3 days under refrigeration followed by 24 hours at room temperature. All of the admixtures developed coalescence after 7 days under refrigeration followed by 24 hours at greater than 28°C.<sup>2621</sup>

The case of a 26-year-old female with Crohn's disease and enterocutaneous fistulae receiving a 3-in-1 parenteral nutrition admixture composed of Travasol 3.6%, dextrose 13.6%, Intralipid 1.5%, sodium chloride 52.3 mEq/L, sodium acetate 27.4 mEq/L, potassium chloride 27.4 mEq/L, potassium acetate 13.7 mEq/L, magnesium sulfate 4.5 mEq/L, calcium gluconate 3.2 mEq/L, MVI-12, and trace elements but no inorganic phosphates was presented. The patient became febrile, short of breath, and developed a dry cough with diffuse crackles in both lungs. After failing to respond to conventional medical therapy, an open lung biopsy was performed and showed widespread vascular pulmonary thromboses from irregularly shaped crystals leading to the lung perfusion defects. High levels of calcium, potassium, and carbon were detected in the crystals. Subsequent repeat testing in vitro failed to find crystallization. The patient's fever was postulated to contribute to the in vivo crystallization.<sup>2621</sup>

The physical stability of 5 highly concentrated 3-in-1 parenteral nutrition admixtures for fluid-restricted adults was evaluated. The admixtures were composed of Aminoplasmal (B. Braun) at concentrations over 7% as the amino acids source, dextrose concentrations of about 20%, and a 50:50 mixture of medium-chain triglycerides and long-chain triglycerides (Lipofundin MCT, B. Braun) at concentrations of about 2.5 to 2.7% as the lipid component with electrolytes and vitamins (TNA #269 through #273 in Appendix). The parenteral nutrition admixtures were prepared in EVA bags and stored at room temperature for 30 hours. Electronic evaluation of mean fat particle sizes and globule size distribution found little change over the 30-hour test period.<sup>2721</sup>

### Considerations and Recommendations

When multicomponent, 3-in-1, parenteral nutrition admixtures are used, the following points should be considered.<sup>490 703 892 893</sup>

1. The order of mixing is important. The amino acid solution should be added to the dextrose prior to addition of the fat emulsion. This practice ensures that the protective effect of the amino acids to emulsion disruption by changes in pH and the presence of electrolytes is realized. Alternatively, some manufacturers of lipid emulsion state that all 3 components may be transferred to the admixture containers simultaneously, admixing with gentle agitation.
2. Electrolytes should not be added directly to the fat emulsions. Instead, they should be added to the amino acids or dextrose before the final mixing.
3. Such 3-in-1 admixtures containing electrolytes (especially divalent cations) are unstable and will eventually aggregate. The mixed systems should be carefully examined visually before use to ensure that a uniform emulsion still

exists and that separation of the emulsion (i.e., "breaking" or "oiling out"), indicated by yellowish streaking or accumulation of yellowish droplets in the admixed emulsion, has not occurred.

4. Avoid contact of 3-in-1 parenteral nutrition admixtures with heparin, which destabilizes and damages the fat emulsion upon contact. See Heparin section below.
5. The admixtures should be stored under refrigeration if not used immediately.
6. The ultimate stability of the admixtures will be the result of a complex interaction of pH, component concentrations, electrolyte concentrations, and, probably, storage temperature.

Furthermore, a 1.2- $\mu\text{m}$  filter should be used in the administration of fat emulsion, intravenous, whether used alone or administered as a component of a TNA (3-in-1); filtration is necessary to remove large lipid particles, electrolyte precipitates, and other solid particulates and aggregates.<sup>1106 1657 1769 2061 2135 2346 3251 3252 3253 3254 3255 3259 3260</sup>

### Blood Products

Amino acids injection should not be administered simultaneously with blood through the same infusion set because of possible pseudoagglutination.<sup>341</sup>

### Calcium and Phosphate

#### UNRECOGNIZED CALCIUM PHOSPHATE PRECIPITATION IN A 3-IN-1 PARENTERAL NUTRITION MIXTURE RESULTED IN PATIENT DEATH.

The potential for the formation of a calcium phosphate precipitate in parenteral nutrition solutions is well studied and documented,<sup>1771 1777</sup> but the information is complex and difficult to apply to the clinical situation.<sup>1770 1772 1777</sup> The incorporation of fat emulsion in 3-in-1 parenteral nutrition solutions obscures any precipitate that may be present, which has led to substantial debate about the dangers associated with 3-in-1 parenteral nutrition mixtures and when or if the danger to the patient is warranted therapeutically.<sup>1770 1771 1772 2031 2032 2033 2034 2035 2036</sup> Because such precipitation may be life threatening to patients,<sup>2037 2291</sup> FDA issued a Safety Alert containing the following recommendations:<sup>1769</sup>

1. "The amounts of phosphorus and of calcium added to the admixture are critical. The solubility of the added calcium should be calculated from the volume at the time the calcium is added. It should not be based upon the final volume.

Some amino acid injections for TPN admixtures contain phosphate ions (as a phosphoric acid buffer). These phosphate ions and the volume at the time the phosphate is added should be considered when calculating the concentration of phosphate additives. Also, when adding calcium and phosphate to an admixture, the phosphate should be added first.

The line should be flushed between the addition of any potentially incompatible components.

2. A lipid emulsion in a 3-in-1 admixture obscures the presence of a precipitate. Therefore, if a lipid emulsion is needed, either (1) use a 2-in-1 admixture with the lipid infused separately, or (2) if a 3-in-1 admixture is medically necessary, then add the

calcium before the lipid emulsion and according to the recommendations in number 1 above.

If the amount of calcium or phosphate which must be added is likely to cause a precipitate, some or all of the calcium should be administered separately. Such separate infusions must be properly diluted and slowly infused to avoid serious adverse events related to the calcium.

3. When using an automated compounding device, the above steps should be considered when programming the device. In addition, automated compounders should be maintained and operated according to the manufacturer's recommendations.

Any printout should be checked against the programmed admixture and weight of components.

4. During the mixing process, pharmacists who mix parenteral nutrition admixtures should periodically agitate the admixture and check for precipitates. Medical or home care personnel who start and monitor these infusions should carefully inspect for the presence of precipitates both before and during infusion. Patients and care givers should be trained to visually inspect for signs of precipitation. They also should be advised to stop the infusion and seek medical assistance if precipitates are noted.

5. A filter should be used when infusing either central or peripheral parenteral nutrition admixtures. At this time, data have not been submitted to document which size filter is most effective in trapping precipitates.

Standards of practice vary, but the following is suggested: a 1.2- $\mu\text{m}$  air-eliminating filter for lipid-containing admixtures and a 0.22- $\mu\text{m}$  air-eliminating filter for non-lipid-containing admixtures.

6. Parenteral nutrition admixtures should be administered within the following time frames: if stored at room temperature, the infusion should be started within 24 hours after mixing; if stored at refrigerated temperatures, the infusion should be started within 24 hours of rewarming. Because warming parenteral nutrition admixtures may contribute to the formation of precipitates, once administration begins, care should be taken to avoid excessive warming of the admixture.

Persons administering home care parenteral nutrition admixtures may need to deviate from these time frames. Pharmacists who initially prepare these admixtures should check a reserve sample for precipitates over the duration and under the conditions of storage.

7. If symptoms of acute respiratory distress, pulmonary emboli, or interstitial pneumonitis develop, the infusion should be stopped immediately and thoroughly checked for precipitates. Appropriate medical interventions should be instituted. Home care personnel and patients should immediately seek medical assistance."

### Calcium Phosphate Precipitation Fatalities

Fatal cases of paroxysmal respiratory failure in 2 previously healthy women receiving peripheral vein parenteral nutrition were reported. The patients experienced sudden cardiopulmonary arrest consistent with pulmonary emboli. The authors used in vitro simulations and an animal model to conclude that unrecognized calcium phosphate precipitation in a 3-in-1 total

nutrition admixture caused the fatalities. The precipitation resulted during compounding by introducing calcium and phosphate near to one another in the compounding sequence and prior to complete fluid addition. This resulted in a temporarily high concentration of the drugs and precipitation of calcium phosphate. Observation of the precipitate was obscured by the incorporation of 20% fat emulsion, intravenous, into the nutrition mixture. No filter was used during infusion of the fatal nutrition admixtures.<sup>2037</sup>

In a follow-up retrospective review, 5 patients were identified who had respiratory distress associated with the infusion of the 3-in-1 admixtures at around the same time. Four of these 5 patients died, although the cause of death could be definitively determined for only 2.<sup>2291</sup>

### Calcium and Phosphate Conditional Compatibility

Calcium salts are conditionally compatible with phosphate in parenteral nutrition solutions. The incompatibility is dependent on a solubility and concentration phenomenon and is not entirely predictable. Precipitation may occur during compounding or at some time after compounding is completed.

NOTE: Some amino acids solutions inherently contain calcium and phosphate, which must be considered in any projection of compatibility.

A study determined the maximum concentrations of calcium (as chloride and gluconate) and phosphate that can be maintained without precipitation in a parenteral nutrition solution consisting of FreAmine II 4.25% and dextrose 25% for 24 hours at 30°C. It was noted that the amino acids in parenteral nutrition solutions form soluble complexes with calcium and phosphate, reducing the available free calcium and phosphate that can form insoluble precipitates. The concentration of calcium available for precipitation is greater with the chloride salt compared to the gluconate salt, at least in part because of differences in dissociation characteristics. Consequently, a greater concentration of calcium gluconate than calcium chloride can be mixed with sodium phosphate.<sup>608</sup>

In addition to the concentrations of phosphate and calcium and the salt form of the calcium, the concentration of amino acids and the time and temperature of storage altered the formation of calcium phosphate in parenteral nutrition solutions. As the temperature was increased, the incidence of precipitate formation also increased. This finding was attributed, at least in part, to a greater degree of dissociation of the calcium and phosphate complexes and the decreased solubility of calcium phosphate. Therefore, a solution possibly may be stored at 4°C with no precipitation, but on warming to room temperature a precipitate will form over time.<sup>608</sup>

The compatibility of calcium and phosphate in several parenteral nutrition formulas for newborn infants was evaluated. Calcium gluconate 10% (Cutter) and potassium phosphate (Abbott) were used to achieve concentrations of 2.5 to 100 mEq/L of calcium and 2.5 to 100 mmol/L of phosphorus added. The parenteral nutrition solutions evaluated were as shown in Table 6. The results were reported as graphic depictions.

**Table 6. Parenteral nutrition solutions evaluated<sup>609</sup>**

Component	Solution Number			
	#1	#2	#3	#4
FreAmine III	4%	2%	1%	1%
Dextrose	25%	20%	10%	10%
pH	6.3	6.4	6.6	7.0 <sup>a</sup>

<sup>a</sup> Adjusted with sodium hydroxide.

The pH dependence of the phosphate–calcium precipitation has been noted. Dibasic calcium phosphate is very insoluble, while monobasic calcium phosphate is relatively soluble. At low pH, the soluble monobasic form predominates; but as the pH increases, more dibasic phosphate becomes available to bind with calcium and precipitate. Therefore, the lower the pH of the parenteral nutrition solution, the more calcium and phosphate can be solubilized. Once again, the effects of temperature were observed. As the temperature is increased, more calcium ion becomes available and more dibasic calcium phosphate is formed. Therefore, temperature increases will increase the amount of precipitate.<sup>609</sup>

Similar calcium and phosphate solubility curves were reported for neonatal parenteral nutrition solutions using TrophAmine (McGaw) 2, 1.5, and 0.8% as the sources of amino acids. The solutions also contained dextrose 10%, with cysteine and pH adjustment being used in some admixtures. Calcium and phosphate solubility followed the patterns reported previously.<sup>609</sup> A slightly greater concentration of phosphate could be used in some mixtures, but this finding was not consistent.<sup>1024</sup>

Using a similar study design, 6 neonatal parenteral nutrition solutions based on Aminosyn-PF (Abbott) 2, 1.5, and 0.8%, with and without added cysteine hydrochloride and dextrose 10% were studied. Calcium concentrations ranged from 2.5 to 50 mEq/L, and phosphate concentrations ranged from 2.5 to 50 mmol/L. Solutions sat for 18 hours at 25°C and then were warmed to 37°C in a water bath to simulate the clinical situation of warming prior to infusion into a child. Solubility curves were markedly different than those for TrophAmine in the previous study.<sup>1024</sup> Solubilities were reported to decrease by 15 mEq/L for calcium and 15 mmol/L for phosphate. The solutions remained clear during room temperature storage, but crystals often formed on warming to 37°C.<sup>1211</sup>

However, these data were questioned by Mikrut, who noted the similarities between the Aminosyn-PF and TrophAmine products and found little difference in calcium and phosphate solubilities in a preliminary report.<sup>1212</sup> In the full report,<sup>1213</sup> parenteral nutrition solutions containing Aminosyn-PF or TrophAmine 1 or 2.5% with dextrose 10 or 25%, respectively, plus electrolytes and trace metals, with or without cysteine hydrochloride, were evaluated under the same conditions. Calcium concentrations ranged from 2.5 to 50 mEq/L, and phosphate concentrations ranged from 5 to 50 mmol/L. In contrast to the previous results,<sup>1024</sup> the solubility curves were very similar for the Aminosyn-PF and TrophAmine parenteral nutrition solutions but very different from those of the previous Aminosyn-PF study.<sup>1211</sup> The

authors again showed that the solubility of calcium and phosphate is greater in solutions containing higher concentrations of amino acids and dextrose.<sup>1213</sup>

Calcium and phosphate solubility curves for TrophAmine 1 and 2% with dextrose 10% and electrolytes, vitamins, heparin, and trace elements were reported. Calcium concentrations ranged from 10 to 60 mEq/L, and phosphorus concentrations ranged from 10 to 40 mmol/L. Calcium and phosphate solubilities were assessed by analysis of the calcium concentrations and followed patterns similar to those reported previously.<sup>608 609</sup> The higher percentage of amino acids (TrophAmine 2%) permitted a slightly greater solubility of calcium and phosphate, especially in the 10 to 50-mEq/L and 10 to 35-mmol/L ranges, respectively.<sup>1614</sup>

The maximal product of the amount of calcium (as gluconate) times phosphate (as potassium) that can be added to a parenteral nutrition solution, composed of amino acids 1% (Travenol) and dextrose 10%, for preterm infants was reported. Turbidity was observed on initial mixing when the solubility product was around 115 to 130 mmol<sup>2</sup> (mmol squared) or greater. After storage at 7°C for 20 hours, visible precipitates formed at solubility products of 130 mmol<sup>2</sup> (mmol squared) or greater. If the solution was administered through a barium-impregnated silicone rubber catheter, crystalline precipitates obstructed the catheters in 12 hours at a solubility product of 100 mmol<sup>2</sup> (mmol squared) and in 10 days at 79 mmol<sup>2</sup> (mmol squared), much lower than the in vitro results.<sup>1041</sup>

The solubility characteristics of calcium and phosphate in pediatric parenteral nutrition solutions composed of Aminosyn 0.5, 2, and 4% with dextrose 10 to 25% were reported. Also present were electrolytes and vitamins. Sodium phosphate was added sequentially in phosphorus concentrations from 10 to 30 mmol/L. Calcium gluconate was added last in amounts ranging from 1 to 10 g/L. The solutions were stored at 25°C for 30 hours and examined visually and microscopically for precipitation. The authors found that higher concentrations of Aminosyn increased the solubility of calcium and phosphate. Precipitation occurred at lower calcium and phosphate concentrations in the 0.5% solution compared to the 2 and 4% solutions. For example, at a phosphorus concentration of 30 mmol/L, precipitation occurred at calcium gluconate concentrations of about 1, 2, and 4 g/L in the 0.5, 2, and 4% Aminosyn mixtures, respectively. Similarly, at a calcium gluconate concentration of 8 g/L and above, precipitation occurred at phosphorus concentrations of about 13, 17, and 22 mmol/L in the 0.5, 2, and 4% solutions, respectively. The dextrose concentration did not appear to affect the calcium and phosphate solubility significantly.<sup>1042</sup>

The solubility of calcium and phosphorus in neonatal parenteral nutrition solutions composed of amino acids (Abbott) 1.25 and 2.5% with dextrose 5 and 10%, respectively, was evaluated. Also present were multivitamins and trace elements. The solutions contained calcium (as gluconate) in amounts ranging from 25 to 200 mg/100 mL. The phosphorus (as potassium phosphate) concentrations evaluated ranged from 25 to 150 mg/100 mL. If calcium gluconate was added first, cloudiness occurred immediately. If potassium phosphate was added first, substantial quantities could be added with no precipitate formation in 48 hours at 4°C (Table 7). However, if stored at 22°C, the solutions were stable for only 24 hours, and all contained precipitates after 48 hours.<sup>1210</sup>

**Table 7. Maximum calcium and phosphorus concentrations physically compatible for 48 hours at 4°C<sup>1210</sup>**

Calcium (mg/100 mL)	Phosphorus (mg/100 mL)

<sup>a</sup> Plus multivitamins and trace elements.

<sup>b</sup> Maximum concentration tested.

The physical compatibility of calcium gluconate 10 to 40 mEq/L and potassium phosphates 10 to 40 mmol/L in 3 neonatal parenteral nutrition solutions (TPN #123 to #125 in Appendix), alone and with retrograde administration of aminophylline 7.5 mg diluted with 1.5 mL of sterile water for injection was reported. Contact of the alkaline aminophylline solution with the parenteral nutrition solutions resulted in the precipitation of calcium phosphate at much lower concentrations than were compatible in the parenteral nutrition solutions alone.<sup>1404</sup>

Additional calcium and phosphate solubility curves were reported for specialty parenteral nutrition solutions based on NephAmine and also HepatAmine at concentrations of 0.8, 1.5, and 2% as the sources of amino acids. The solutions also contained dextrose 10%, with cysteine and pH adjustment to simulate addition of fat emulsion used in some admixtures. Calcium and phosphate solubility followed the hyperbolic patterns previously reported.<sup>609</sup> Temperature, time, and pH affected calcium and phosphate solubility, with pH having the greatest effect.<sup>2038</sup>

The maximum sodium phosphate concentrations were reported for given amounts of calcium gluconate that could be admixed in parenteral nutrition solutions containing TrophAmine in varying quantities (with cysteine hydrochloride 40 mg/g of amino acid) and dextrose 10%. The solutions also contained magnesium sulfate 4 mEq/L, potassium acetate 24 mEq/L, sodium chloride 32 mEq/L, pediatric multivitamins, and trace elements. The presence of cysteine hydrochloride reduces the solution pH and increases the amount of calcium and phosphate that can be incorporated before precipitation occurs. The results of this study cannot be safely extrapolated to TPN solutions with compositions other than the ones tested. The admixtures were compounded with the sodium phosphate added last after thorough mixing of all other components. The authors noted that this is not the preferred order of mixing (usually phosphate is added first and thoroughly mixed before adding calcium last); however, they believed this reversed order of mixing would provide a margin of error in cases in which the proper order is not followed. After compounding, the solutions were stored for 24 hours at 40°C. The maximum calcium and phosphate amounts that could be mixed in the various solutions were reported tabularly and are shown in Table 8.<sup>2039</sup> However, these results are not entirely consistent with another study. See Table 9.

**Table 8. Maximum amount of phosphate (as sodium) (mmol/L) not resulting in precipitation.<sup>2039</sup> See caution below.<sup>a</sup>**

Calcium (as Gluconate)	Amino Acid (as TrophAmine) plus Cysteine HCl 40 mg/g Amino Acid				
	0%	0.4%	1%	2%	3%
9.8 mEq/L	0	27	42	60	66
14.7 mEq/L	0	15	18	30	36
19.6 mEq/L	0	6	15	27	30
29.4 mEq/L	0	3	6	21	24

<sup>a</sup> CAUTION: The results cannot be safely extrapolated to solutions with formulas other than the ones tested. See text.

The temperature dependence of the calcium–phosphate precipitation has resulted in the occlusion of a subclavian catheter by a solution apparently free of precipitation. The parenteral nutrition solution consisted of FreAmine III 500 mL, dextrose 70% 500 mL, sodium chloride 50 mEq, sodium phosphate 40 mmol, potassium acetate 10 mEq, potassium phosphate 40 mmol, calcium gluconate 10 mEq, magnesium sulfate 10 mEq, and Shil's trace metals solution 1 mL. Although there was no evidence of precipitation in the bottle, tubing and pump cassette, and filter (all at approximately 26°C) during administration, the occluded catheter and Vicra Loop Lock (next to the patient's body at 37°C) had numerous crystals identified as calcium phosphate. In vitro, this parenteral nutrition solution had a precipitate in 12 hours at 37°C but was clear for 24 hours at 26°C.<sup>610</sup>

Similarly, a parenteral nutrition solution that was clear and free of particulates after 2 weeks under refrigeration developed a precipitate in 4 to 6 hours when stored at room temperature. When the solution was warmed in a 37°C water bath, precipitation occurred in 1 hour. Administration of the solution before the precipitate was noticed led to interstitial pneumonitis due to deposition of calcium phosphate crystals.<sup>1427</sup>

The maximum allowable concentrations of calcium and phosphate in a 3-in-1 parenteral nutrition mixture for children (TNA #192 in Appendix) were reported. Added calcium was varied from 1.5 to 150 mmol/L, and added phosphate was varied from 21 to 300 mmol/L. These mixtures were stable for 48 hours at 22 and 37°C as long as the pH was not greater than 5.7, the calcium concentration was below 16 mmol/L, the phosphate concentration was below 52 mmol/L, and the product of the calcium and phosphate concentrations was below 250 mmol<sup>2</sup>/L<sup>2</sup> (mmol squared per liter squared).<sup>1773</sup>

Calcium phosphate precipitation phenomena was evaluated in a series of parenteral nutrition admixtures composed of dextrose 22%, amino acids (FreAmine III) 2.7%, and fat emulsion (Abbott) 0, 1, and 3.2%. Incorporation of calcium gluconate 19 to 24 mEq/L and phosphate (as sodium) 22 to 28 mmol/L resulted in visible precipitation in the fat-free admixtures. New precipitate continued to form over 14 days, even after repeated filtrations of the solutions through 0.2-µm filters. The presence of the amino acids increased calcium and phosphate solubility, compared with simple aqueous solutions. However, the

incorporation of the fat emulsion did not result in a statistically significant increase in calcium and phosphate solubility. The authors noted that the kinetics of calcium phosphate precipitate formation do not appear to be entirely predictable; both transient and permanent precipitation can occur either during the compounding process or at some time afterward. Because calcium phosphate precipitation can be very dangerous clinically, the use of inline filters was recommended. The authors suggested that the filters should have a porosity appropriate to the parenteral nutrition admixture—1.2 µm for fat-containing and 0.2 or 0.45 µm for fat-free nutrition mixtures.<sup>2061</sup>

Laser particle analysis was used to evaluate the formation of calcium phosphate precipitation in pediatric TPN solutions containing TrophAmine in concentrations ranging from 0.5 to 3% with dextrose 10% and also containing L-cysteine hydrochloride 1 g/L. The solutions also contained in each liter sodium chloride 20 mEq, sodium acetate 20 mEq, magnesium sulfate 3 mEq, trace elements 3 mL, and heparin sodium 500 units. The presence of L-cysteine hydrochloride reduces the solution pH and increases the amount of calcium and phosphate that can be incorporated before precipitation occurs. The results of this study cannot be safely extrapolated to TPN solutions with compositions other than the ones tested. The maximum amount of phosphate that was incorporated without the appearance of a measurable increase in particulates in 24 hours at 37°C for each of the amino acids concentrations is shown in Table 9.<sup>2196</sup> These results are not entirely consistent with previous results.<sup>2039</sup> See above. The use of more sensitive electronic particle measurement for the formation of subvisible particulates in this study may contribute to the differences in the results.

**Table 9. Maximum amount of phosphate (as potassium) (mmol/L) not resulting in precipitation.<sup>2196</sup> See caution below.<sup>a</sup>**

<sup>a</sup> CAUTION: The results cannot be safely extrapolated to solutions with formulas other than the ones tested. See text.

Calcium and phosphate compatibility was evaluated in a series of parenteral nutrition admixtures composed of Aminosyn II in concentrations ranging from 2% up to 5% (TPN #227 to #231 in Appendix). The solutions also contained dextrose ranging from 10% up to 25%. Also present were sodium chloride, potassium chloride, and magnesium sulfate in common amounts. Phosphates as the potassium salt and calcium as the acetate salt were added in variable quantities to determine the maximum amounts of calcium and phosphates that could be added to the representative TPN admixtures. The samples were evaluated at 23 and 37°C over 48 hours by visual inspection in ambient light and using a Tyndall beam and electronically measured for turbidity and microparticulates. The boundaries between the compatible and incompatible concentrations were presented graphically as hyperbolic curves.<sup>2265</sup>

The solubility of calcium acetate versus calcium gluconate with sodium phosphates was evaluated in pediatric parenteral nutrition solutions following storage for 30 hours at 25°C followed by 30 minutes at 37°C. Concentrations of Aminosyn PF studied varied from 1 to 3%, dextrose from 10 to 25%, calcium from 5 to 60 mEq/L, and phosphate from 1 to 60 mmol/L. L-cysteine hydrochloride at a dose of 40 mg/g of Aminosyn PF, magnesium 3.2 mEq/L, and pediatric trace elements-4 at 2.4 mL/L of pediatric parenteral nutrition solution were also added. Calcium acetate was found to be less soluble than calcium gluconate when prepared under these concentrations. The maximum concentrations of the calcium salts and sodium phosphates are shown in Table 10. Polarized light microscopy was used to identify the calcium acetate and sodium phosphate crystals adherent to the container walls because simple visual observation was not able to identify the precipitates. The authors recommended the use of calcium acetate to reduce the iatrogenic aluminum exposure often seen with calcium gluconate in the neonatal population receiving parenteral nutrition.<sup>2466</sup> However, care must be taken to avoid inadvertent calcium phosphate precipitation at the lower concentrations found with calcium acetate if it is substituted for the gluconate salt to reduce aluminum exposure.

**Table 10. Maximum concentrations of sodium phosphates and calcium as acetate and as gluconate not resulting in precipitation<sup>2466</sup>**

Aminosyn PF (%)	Sodium Phosphates (mmol/L)	Calcium Acetate (mEq/L)	Calcium Gluconate (mEq/L)
1	10	25	50
1	15	15	25
2	10	30	45
2	25	10	12.5
3	20	10	15
3	25	15	17.5

Calcium and phosphate compatibility was evaluated in a series of adult formula parenteral nutrition admixtures composed of FreAmine III, in concentrations ranging from 1 to 5% (TPN #258

through #262). The solutions also contained dextrose ranging from 15% up to 25%. Also present were sodium chloride, potassium chloride, and magnesium sulfate in common amounts. Cysteine hydrochloride was added in an amount of 25 mg/g of amino acids from FreAmine III to reduce the pH by about 0.5 pH unit and thereby increase the amount of calcium and phosphates that can be added to the TPN admixtures as has been done with pediatric parenteral nutrition admixtures. Phosphates as the potassium salts and calcium as the gluconate salt were added in variable quantities to determine the maximum amounts of calcium and phosphates that could be added to the test admixtures. The samples were evaluated at 23 and 37°C over 48 hours by visual inspection in ambient light and using a Tyndall beam and electronic measurement of turbidity and microparticulates. The addition of the cysteine hydrochloride resulted in an increase of calcium and phosphates solubility of about 30% by lowering the solution pH 0.5 pH unit. The boundaries between the compatible and incompatible concentrations were presented graphically as hyperbolic curves.<sup>2469</sup>

A 2-in-1 parenteral nutrition admixture with final concentrations of TrophAmine 0.5%, dextrose 5%, L-cysteine hydrochloride 40 mg/g of amino acids, calcium gluconate 60 mg/100 mL, and sodium phosphates 46.5 mg/mL was found to result in visible precipitation of calcium phosphate within 30 hours stored at 23 to 27°C. Despite the presence of the acidifying L-cysteine hydrochloride, precipitation occurred at clinically utilized amounts of calcium and phosphates.<sup>2622</sup>

The presence of magnesium in solutions may also influence the reaction between calcium and phosphate, including the nature and extent of precipitation.<sup>158 159</sup>

The interaction of calcium and phosphate in parenteral nutrition solutions is a complex phenomenon. Various factors play a role in the solubility or precipitation of a given combination, including:<sup>608 609 1042 1063 1427 2038 2039 2061</sup>

1. Concentration of calcium
2. Salt form of calcium
3. Concentration of phosphate
4. Concentration of amino acids
5. Amino acids composition
6. Concentration of dextrose
7. Temperature of solution
8. pH of solution
9. Presence of other additives
10. Order of mixing

Enhanced precipitate formation would be expected from such factors as high concentrations of calcium and phosphate, increases in solution pH, decreased amino acid concentrations, increases in temperature, addition of calcium prior to the phosphate, lengthy standing times or slow infusion rates, and use of calcium as the chloride salt.<sup>854</sup>

Even if precipitation does not occur in the bottle, it has been reported that crystallization of calcium phosphate may occur in a Silastic infusion pump chamber or tubing if the rate of administration is slow, as for premature infants. Water vapor may be transmitted outward and be replaced by air rapidly enough to produce supersaturation.<sup>202</sup> Several other cases of catheter occlusion also have been reported.<sup>610 1427 1428 1429</sup>

## Vitamins

As might be expected, vitamin stability has been found to be better during nighttime when compared to daytime because of the influence of photodecomposition.<sup>2307</sup>

A patient receiving 3000 international units of retinol daily in a parenteral nutrition solution, nevertheless, experienced 2 episodes of night blindness. The pharmacy prepared the parenteral nutrition solution in 1-L PVC bags in weekly batches and stored them at 4°C in the dark until use. A subsequent *in vitro* study showed losses of vitamin A of 23 and 77% in 3- and 14-day periods, respectively, under these conditions. About 30% of the lost vitamin A could be extracted from the PVC bag.<sup>1038</sup>

Losses of vitamin A from multivitamins (USV) in a neonatal parenteral nutrition solution was reported. The solution was prepared in colorless glass bottles and run through an administration set with a burette (Travenol). The total loss of vitamin A was 75% in 24 hours, with about 16% as decomposition in the glass bottle. The decomposition was not noticeable during the first 12 hours, but then vitamin A levels fell rather precipitously to about one-third of the initial amount. The balance of the loss, averaging about 59%, occurred during transit through the administration set. Removal of the inline filter and treatment of the set with albumin human had no effect on vitamin A delivery. The authors recommended a threefold to fourfold increase in the amount of vitamin A to compensate for the losses.<sup>1039</sup>

A parenteral nutrition solution in glass bottles exposed to sunlight was reported. Vitamin A decomposed rapidly, losing more than 50% in 3 hours. The decomposition could be slowed by covering the bottle with a light-resistant vinyl bag, resulting in about a 25% loss in 3 hours.<sup>1040</sup>

Vitamin E was stable in the parenteral nutrition solution in glass bottles exposed to sunlight, with no loss occurring during 6 hours of exposure.<sup>1040</sup>

It was reported that 40% retinol losses occurred in 2 hours and 60% in 5 hours from parenteral nutrition solutions pumped at 10 mL/hr through standard infusion sets at room temperature. The retinol concentration in the bottle remained constant while the retinol in the effluent decreased. Antioxidants had no effect. Much of the vitamin A was recoverable from hexane washings of the tubing.<sup>1050</sup>

The delivery of vitamins A, D, and E from a parenteral nutrition solution composed of amino acids 3% solution (Pharmacia) in dextrose 10% with electrolytes, trace elements, vitamin K, folate, and vitamin B12 was evaluated. To this solution was added 6 mL of multivitamin infusion (USV). The solution was prepared in PVC bags (Travenol), and administration was simulated through a fluid chamber (Buretrol) and infusion tubing with a 0.5- $\mu$ m filter at 10 mL/hr. During the first 60 to 90 minutes, minimal delivery of the vitamins occurred. This was followed by a rise and plateau in the delivered vitamins, which were attributed to an increasing saturation of adsorptive binding sites in the tubing. Total amounts delivered over 24 hours were 31% for vitamin A, 68% for vitamin D, and 64% for vitamin E. Sorption of the vitamins was found in the PVC bag, fluid chamber, and tubing. Decomposition was not a factor.<sup>836</sup>

Vitamin A was found to rapidly and significantly decompose when exposed to daylight. The extent and rate of loss were dependent on the degree of exposure to daylight which, in turn, depended on various factors such as the direction of the radiation, time of day, and climatic conditions. Delivery of less than 10% of the expected amount was reported.<sup>1047</sup> In controlled light experiments, the decomposition initially progressed exponentially. Subsequently, the rate of decomposition slowed. This result was attributed to a protective effect of the degradation products on the remaining vitamin A. The presence of amino acids provided greater protection. Compared to degradation rates in dextrose 5%, decomposition was reduced by up to 50% in some amino acid mixtures.<sup>1048</sup>

In a parenteral nutrition solution composed of amino acids, dextrose, electrolytes, trace elements, and multivitamins in PVC bags stored at 4 and 25°C, vitamin A rapidly deteriorated to 10% of the initial concentration in 8 hours at 25°C while exposed to light. The decomposition was slowed by light protection and refrigeration, with a loss of about 25% in 4 days. Folic acid concentration dropped 40% initially on admixture and then remained relatively constant for 28 days of storage. About 35% of the ascorbic acid was lost in 39 hours at 25°C with exposure to light. The loss was reduced to a negligible amount in 4 days by refrigeration and light protection. Thiamine content dropped by about 50% initially but then remained unchanged over 120 hours of storage.<sup>1063</sup>

A 50% loss of vitamin A from a bottle of parenteral nutrition solution prepared with multivitamin infusion (USV) after 5.5 hours of infusion was noted. The amount delivered through an Ivex-2 filter set was only 6.3% of the added amount. Similar quantities were found after 20 hours of infusion. A reduced light exposure and use of <sup>3</sup>H-labeled vitamin A confirmed binding to the infusion bottles and tubing.<sup>704</sup>

Subsequently, solutions containing multivitamins (USV) spiked with <sup>3</sup>H-labeled retinol were incubated in intravenous tubing protected from light and agitated to simulate flow for 5 hours. About half of the vitamin A was lost in 30 minutes, and 88 to 96% was lost in 5 hours. Spectrophotometric assays correlated closely with the radioisotope assays. Hexane rinses and radioactivity determinations on the tubing accounted for the decrease in radioactivity.<sup>1049</sup>

In another experiment, neonatal parenteral nutrition solutions containing multivitamins prepared in bags were delivered at 10 mL/hr through Buretrol sets (Travenol). The bags and sets were protected from light. Spectrophotometric and radioisotope assays showed that about 26% of the vitamin A was lost before the flow was started. At 10 mL/hr, about 67% was lost from the effluent. More rapid flow reduced the extent of loss. Analysis of clinical samples of parenteral nutrition solutions showed losses of 21 to 57% after 20 hours. Because losses after 5 hours were of the same magnitude, the authors concluded that the loss occurs fairly rapidly and is not due to gradual decomposition.<sup>1049</sup>

The quantity of retinol delivered from an M.V.I.-containing 2-in-1 parenteral nutrition solution and when M.V.I. was added to Intralipid 10% was evaluated during simulated administration through a PVC administration set. The parenteral nutrition solution was composed of amino acids 2.8%, dextrose 10%,

and standard electrolytes; M.V.I. was added to yield a nominal retinol concentration of 455 mcg/150 mL. Retinol losses were about 80% of the admixed amount after being delivered through the PVC set. When M.V.I. was added to Intralipid 10% in a retinol concentration of 455 mcg/20 mL, retinol losses were reduced to about 10% of the admixed amount. The fat emulsion provides retinol protection from sorption to the PVC administration set.<sup>2027</sup>

Substantially higher amounts of retinol were found to be delivered using polyolefin administration set tubing when compared with PVC tubing during simulated neonatal intensive care administration. Retinol was added to a 2-in-1 parenteral nutrition solution (TPN #206) in concentrations of 25 and 50 international units/mL and run at 4 and 10 mL/hr through 3 meter lengths of polyolefin (MiniMed) and PVC (Baxter) intravenous extension set tubing protected from light and passed through a 37°C water bath. Delivered quantities of retinol varied from 19 to 74% through the PVC tubing and 47 to 87% through the polyolefin tubing. The authors noted that the loss of retinol to the PVC tubing appeared to be saturable. Even so, the use of polyolefin tubing increases the amount of retinol delivered during simulated neonatal administration.<sup>2028</sup>

Substantial loss of retinol all-*trans* palmitate and phytonadione from both TPN and TNA admixtures due to exposure to sunlight was reported. In 3 hours of exposure to sunlight, essentially total loss of retinol and 50% loss of phytonadione had occurred. The presence or absence of lipids did not affect stability. In contrast, tocopherol concentrations remained essentially unchanged by exposure to sunlight through 12 hours. The container material used to store the nutrition admixtures affected the concentration of the vitamins as well. Losses were greatest (10 to 25%) in PVC containers and were slightly better in EVA and glass containers.<sup>2049</sup>

The photodegradation of vitamins A and E in a 2-in-1 (Synthamin 9, dextrose 20%) admixture and a 3-in-1 (Synthamin 9, dextrose 20%, Intralipid 20%, electrolytes, vitamins, trace elements) admixture after exposure to 6 hours of indirect daylight was reported. The compounded admixtures were prepared in multilayer bags protected from light and stored at 5°C for a minimum of 5 days. The same admixtures were prepared in EVA bags 24 hours prior to use with vitamins added prior to study. Vitamin A decreased to 60 to 80% of the initial concentrations in 2 to 6 hours of exposure to indirect daylight. The type of bag had no influence on the photodegradation of vitamin A. Despite fat emulsion, no significant light protection was noted with the 3-in-1 admixture. Vitamin E losses were 15% in 6 hours with multilayer bags of both admixtures; however, 100% loss was noted with EVA bags within 1 hour for the 2-in-1 admixture. The presence of the opaque fat emulsion provided some protection; however, losses greater than 50% were noted by 6 hours in the EVA bags. The authors concluded that the use of multilayer bags prevents vitamin E losses during daylight exposure as compared to EVA bags but only light protection can minimize vitamin A losses.<sup>2459</sup>

The stability of retinol palmitate and tocopherols ( $\delta$ ,  $\gamma$ , and  $\alpha$ ) in 3-in-1 admixtures of amino acids 4%, dextrose 10%, fat emulsion 3% (Intralipid, Liposyn, and ClinOleic), various

electrolytes, vitamins, and trace elements in EVA bags over 3 days at 4, 25, and 37°C was evaluated. Retinol palmitate was found to be unstable at room temperature with 33 and 50% degradation at 24 and 72 hours after compounding, respectively. Refrigeration of the admixture reduced the degradation to 29% at 72 hours. The tocopherols displayed varying stability over the temperature range with 16 to 25% degradation after 72 hours. The variation in the tocopherols was theorized to be from the free conversion between the oxidized and reduced forms over the temperatures tested.<sup>2460</sup>

The stability of vitamin E (alpha-tocopherol acetate from M.V.I.-1000 or Soluzyme) and selenium (from Selepen) in amino acids (Abbott) and dextrose in PVC bags was evaluated. Exposure to fluorescent light and room temperature (23°C) for 24 hours and simulated infusion at 50 mL/hr for 8 hours through a Medlon TPN administration set with a 0.22- $\mu$ m filter did not affect the concentrations of vitamin E and selenium.<sup>1224</sup>

The stability of numerous vitamins in parenteral nutrition solutions composed of amino acids (Kabi-Vitrum), dextrose 30%, and fat emulsion 20% (Kabi-Vitrum) in a 2:1:1 ratio with electrolytes, trace elements, and both fat- and water-soluble vitamins was reported. The admixtures were stored in darkness at 2 to 8°C for 96 hours with no significant loss of retinyl palmitate, alpha-tocopherol, thiamine mononitrate, sodium riboflavin-5'-phosphate, pyridoxine hydrochloride, nicotinamide, folic acid, biotin, sodium pantothenate, and cyanocobalamin. Sodium ascorbate and its biologically active degradation product, dehydroascorbic acid, totaled 59 and 42% of the nominal starting concentration at 24 and 96 hours, respectively. However, the actual initial concentration was only 66% of the nominal concentration.<sup>1225</sup>

When the admixture was subjected to simulated infusion over 24 hours at 20°C, either exposed to room light or light protected, or stored for 6 days in the dark under refrigeration and then subjected to the same simulated infusion, once again the retinyl palmitate, alpha-tocopherol, and sodium riboflavin-5'-phosphate did not undergo significant loss. However, sodium ascorbate and its degradation product, dehydroascorbic acid, had initial combined concentrations of 51 to 65% of the nominal initial concentration, with further declines during infusion. Light protection did not significantly alter the loss of total ascorbic acid.<sup>1225</sup>

The stability of several vitamins from M.V.I.-12 (Armour) admixed in parenteral nutrition solutions composed of different amino acid products, with or without Intralipid 10%, when stored in glass bottles and PVC bags at 25 and 5°C for 48 hours was reported. Riboflavin, folic acid, and vitamin E were stable in all samples. No vitamin A was lost in any formula in glass bottles, but samples in PVC containers lost as much as 35 and 60% at 5 and 25°C, respectively, in 48 hours. Thiamine hydrochloride was stable in the parenteral nutrition solutions prepared with amino acid products without sulfites. However, amino acid products containing sulfites (Travasol and FreAmine III) had a 25% thiamine loss in 12 hours and a 50% loss in 24 hours when the solutions were stored at 25°C; no loss occurred when the solutions were stored at 5°C. Ascorbic acid was lost from all samples stored at 25°C, with the greatest

losses occurring in solutions stored in plastic bags. No losses occurred in any sample stored at 5°C.<sup>1431</sup>

In another study, the stability of vitamins A, E, C, riboflavin, thiamine, and folic acid following admixture (as M.V.I.-12) with 4 different amino acid products (Novamine, Neopham, FreAmine III, Travasol) with or without Intralipid when stored in glass bottles or PVC bags at 25°C for 48 hours was reported. They found that high-intensity phototherapy light did not affect folic acid, thiamine, or vitamin E; however, ascorbic acid and riboflavin losses were significant with all amino acid products tested. Furthermore, it was noted that vitamin A losses were reduced with the addition of Intralipid to the admixture. When bisulfite was added to the Neopham admixture, riboflavin, folic acid, and ascorbic acid were not affected; however, at a bisulfite concentration of 3 mEq/L, there was substantial losses of vitamin A and thiamine. The authors also noted that ascorbic acid losses were increased with a more alkaline pH and that bisulfite addition offered some protection presumably by bisulfite being preferentially oxidized. The authors concluded that intravenous multivitamins should be added to parenteral nutrition admixtures immediately prior to administration to reduce losses since commercially available amino acid products may contain bisulfites and have varying pH values.<sup>487</sup>

The stability of 5 B vitamins was studied over an 8-hour period in representative parenteral nutrition solutions exposed to fluorescent light, indirect sunlight, and direct sunlight. One 5-mL vial of multivitamin concentrate (Lyphomed) and 1 mg of folic acid (Lederle) were added to a liter of parenteral nutrition solution composed of amino acids 4.25%–dextrose 25% (Travenol) with standard electrolytes and trace elements. All 5 B vitamins tested were stable for 8 hours at room temperature when exposed to fluorescent light. In addition, folic acid and niacinamide were stable over 8 hours in direct or indirect sunlight. Exposure to indirect sunlight appeared to have little or no effect on thiamine hydrochloride and pyridoxine hydrochloride in 8 hours, but 47% of riboflavin-5'-phosphate was lost in that period. Direct sunlight caused a 26% loss of thiamine hydrochloride and an 86% loss of pyridoxine hydrochloride in 8 hours. Four-hour exposures of riboflavin-5'-phosphate to direct sunlight resulted in a 98% loss.<sup>842</sup>

The effects of photoirradiation on a FreAmine II–dextrose 10% parenteral nutrition solution containing 1 mL/500 mL of multivitamins (USV) were evaluated. During simulated continuous administration to an infant at 0.156 mL/min, no changes to the amino acids occurred when the bottle, infusion tubing, and collection bottle were shielded with foil. Only 20 cm of tubing in the incubator was exposed to light. However, if the flow was stopped, a marked reduction in methionine (40%), tryptophan (44%), and histidine (22%) occurred in the solution exposed to light for 24 hours. In a similar solution without vitamins, only the tryptophan concentration decreased. The difference was attributed to the presence of riboflavin, a photosensitizer. The authors recommended administering the multivitamins separately and shielding from light.<sup>833</sup>

In further work, the authors simulated more closely conditions occurring during phototherapy in neonatal intensive care units. Riboflavin 1 mg/100 mL was added to a solution of amino

acids 2% (Abbott) with dextrose 10%. Infusion was simulated from glass bottles through PVC tubing with a Buretrol at a rate of 4 mL/hr. In addition to the fluorescent room lights, 8 daylight bulbs delivered phototherapy. After a simulated 24-hour infusion, riboflavin decreased to about 50% of its initial level. Also, a 7% reduction in total amino acids was noted, including individual losses of glycine (10%), leucine (14%), methionine (24%), proline (10%), serine (9%), tryptophan (35%), and tyrosine (16%). Although the authors did not believe that these losses of amino acids were nutritionally important, they were concerned about the possibility of toxicity from photo-oxidation products. In the same solution without riboflavin, the individual amino acids decreased only slightly.<sup>974</sup>

The extent and rapidity of ascorbic acid decomposition in parenteral nutrition solutions composed of amino acids, dextrose, electrolytes, multivitamins, and trace elements in 3-L PVC bags stored at 3 to 7°C was reported. About 30 to 40% was lost in 24 hours. The degradation then slowed as the oxygen supply was reduced to the diffusion through the bag. About a 55 to 65% loss occurred after 7 days of storage. The oxidation was catalyzed by metal ions, especially copper. In the absence of copper from the trace elements additive, less than 10% degradation of ascorbic acid occurred in 24 hours. The author estimated that 150 to 200 mg is degraded in 2 to 4 hours at ambient temperature in the presence of copper but that only 20 to 30 mg is broken down in 24 hours without copper. To minimize ascorbic acid loss, copper must be excluded. Alternatively, inclusion of excess ascorbic acid was suggested.<sup>1056</sup>

Extensive decomposition of ascorbic acid and folic acid was reported in a parenteral nutrition solution composed of amino acids 3.3%, dextrose 12.5%, electrolytes, trace elements, and M.V.I.-12 (USV) in PVC bags. Half-lives were 1.1, 2.9, and 8.9 hours for ascorbic acid and 2.7, 5.4, and 24 hours for folic acid stored at 24°C in daylight, 24°C protected from light, and 4°C protected from light, respectively. The decomposition was much greater than for solutions not containing catalyzing metal ions. Also, it was greater than for the vitamins singly because of interactions with the other vitamins present.<sup>1059</sup>

The stability of ascorbic acid in parenteral nutrition solutions, with and without fat emulsion, was studied. Both with and without fat emulsion, the total vitamin C content (ascorbic acid plus dehydroascorbic acid) remained above 90% for 12 hours when the solutions were exposed to fluorescent light and for 24 hours when they were protected from light. When stored in a cool dark place, the solutions were stable for 7 days.<sup>1227</sup>

The stability of several vitamins from M.V.I.-12 (Armour) admixed in parenteral nutrition solutions composed of different amino acid products, with or without Intralipid 10%, when stored in glass bottles and PVC bags at 25 and 5°C for 48 hours was reported. Ascorbic acid was lost from all samples stored at 25°C, with the greatest losses occurring in solutions stored in plastic bags. No losses occurred in any sample stored at 5°C.<sup>1431</sup>

The stability of ascorbic acid and dehydroascorbic acid in a 3-in-1 admixture containing Vamin 14, dextrose 30%, Intralipid 20%, potassium phosphate, Cernevit, and trace elements in EVA bags over a temperature range of 2 to 22°C was examined. They observed an 89% loss of ascorbic acid and a 37% loss of

dehydroascorbic acid over 7 days. The authors concluded that oxygen, trace elements, temperature, and an underfilled bag were the greatest determinants of ascorbic acid loss.<sup>2462</sup>

The long-term stability of ascorbic acid in 3-in-1 admixtures containing amino acids (Eloamin) 10%, dextrose 20%, dextrose 5%, fat emulsion (Elo lipid) 20%, calcium gluconate, M.V.C. 9 + 3, and trace elements mixed in EVA and multilayer (Ultrastab) bags at 5°C was compared. Ascorbic acid losses were greater than 75% in the first 24 hours and 100% after 48 to 72 hours in the EVA bags. In the multilayer bags, ascorbic acid showed a 20 and 40% loss over the first 24 hours with and without fat emulsion, respectively. The initial rapid fall in ascorbic acid was presumably due to the initial oxygen content of the admixtures despite the use of the less oxygen-permeable multilayer bags. The authors noted the ascorbic acid concentration remained stable for up to 28 days in the multilayer bags after the initial fall and recommended adding additional ascorbic acid to compensate for the losses to facilitate extended shelf-life.<sup>2463</sup>

The influence of several factors on the rate of ascorbic acid oxidation in parenteral nutrition solutions was evaluated. Ascorbic acid is regarded as the least stable component in TPN admixtures. The type of amino acid used in the TPN was important. Some, such as FreAmine III and Vamin 14, contain antioxidant compounds (e.g., sodium metabisulfite or cysteine). Ascorbic acid stability was better in such solutions compared with those amino acid solutions having no antioxidant present. Furthermore, the pH of the solution may play a small role, with greater degradation as the pH rises from about 5 to about 7. Adding air to a compounded TPN container can also accelerate ascorbic acid decomposition. The most important factor was the type of plastic container used for the TPN. EVA containers (Mixieva, Miramed) allow more oxygen permeation, which results in substantial losses of ascorbic acid in relatively short time periods. In multilayer TPN bags (Ultrastab, Miramed) designed to reduce gas permeability, the rate of ascorbic acid degradation was greatly reduced. TPNs without antioxidants packaged in EVA bags were found to have an almost total loss of ascorbic acid activity occurring in 1 or 2 days at 5°C. In contrast, in TPNs containing FreAmine III or Vamin 14 packaged in the multilayer bags, most of the ascorbic acid content was retained for 28 days at 5°C. The authors concluded that TPNs made with antioxidant-containing amino acids and packaged in multilayer bags that reduce gas permeability can safely be given extended expiration dates and still retain most of the ascorbic acid activity.<sup>2163</sup>

The initial degradation product of ascorbic acid (dehydroascorbic acid) in a 2-in-1 admixture containing Synthamin 14, glucose 20%, and trace elements over a temperature range of 5 to 35°C was evaluated. The presence of trace elements, including copper, had no influence on the degradation of dehydroascorbic acid. At room temperature and 5°C, there was a greater than 50% loss of dehydroascorbic acid noted within 2 and 24 hours, respectively. The authors concluded this degradation was temperature dependent.<sup>2461</sup>

The degradation of vitamins A, B1, C, and E from Cernevit (Roche) multivitamins in NuTRiflex Lipid Plus (B. Braun) admixtures prepared in ethylene vinyl acetate (EVA) bags and in multilayer bags was evaluated. After storage for up to 72 hours at

4, 21, and 40°C, greater vitamin losses occurred in the EVA bags: vitamin A (retinyl palmitate) losses were 20%, thiamine hydrochloride losses were 25%, alpha-tocopherol losses were 20%, and ascorbic acid losses were approximately 80 to 100%. In the multilayer bags (presumably a better barrier to oxygen transfer), losses were less: vitamin A (retinyl palmitate) losses were 5%, thiamine hydrochloride losses were 10%, alpha-tocopherol losses were 0%, and ascorbic acid losses were approximately 25 to 70%.<sup>2618</sup>

Phytonadione stability in a TPN solution containing amino acids 2%, dextrose 12.5%, "standard" electrolytes, and multivitamins (M.V.I. Pediatric) was evaluated over 24 hours while exposed to light. Vitamin loss, about 7% in 4 hours and 27% in 24 hours, was attributed partly to the light sensitivity of phytonadione.<sup>1815</sup>

### Trace Elements

Because of interactions, recommendations to separate the administration of vitamins and trace elements have been made.<sup>1056 1060 1061</sup> Others have termed such recommendations premature based on differing reports<sup>895 896</sup> and the apparent absence of epidemic vitamin deficiency in parenteral nutrition patients.<sup>1062</sup>

The addition of trace elements to a 3-in-1 parenteral nutrition solution with electrolytes had no adverse effect on the particle size of the fat emulsion after 8 days of storage at 4°C.<sup>1017</sup>

The stability of a 3-in-1 parenteral nutrition mixture (TNA #191 in Appendix) was compared with trace elements added as gluconate salts or chloride salts. TNA #191 with copper 0.24 mg/L, iron 0.5 mg/L, and zinc 2 mg/L in either salt form was physically stable for 7 days at 4 and 25°C.<sup>1787</sup>

Trace elements additives, especially those containing copper ions, have the potential to be incompatible in TPN solutions, resulting in precipitation. In a TPN admixture containing 5% Synthamin 17, 25% dextrose, 1 g of ascorbic acid injection, 14 mmol of calcium chloride, and trace elements solution (David Bull), storage at 20 to 25°C and 2 to 8°C, protected from light, resulted in the formation of a discolored solution in 3 to 7 days and an off-white to yellow precipitate in 8 to 12 days, respectively. Electron microscopy revealed the presence of numerous bipyramidal, 8-sided crystals in sizes from 3 to 30 μm. The authors proposed that the crystals were calcium oxalate. They suggested that the ascorbic acid decomposed to oxalic acid; the oxalic acid then interacted with calcium ions to form calcium oxalate. The authors did not verify their supposition. They noted that the crystals were conformationally different from calcium phosphate crystals and that no phosphate had been added to the admixture. In addition, mixing ascorbic acid injection 500 mg/5 mL with trace elements solution 5 mL results in the formation of a transparent gel that becomes an opaque flocculent precipitate after 5 minutes. The authors recommended adding trace elements well away from injections that can act as ligands and with thorough mixing after each addition. Introduction of air and prolonged storage should be avoided. Incorporating trace elements and ascorbic acid on alternate days was also suggested.<sup>2197</sup>

The chromium and zinc contamination of various components of parenteral nutrition solutions by atomic absorption

spectrophotometry was evaluated. They analyzed FreAmine III, Aminosyn, TrophAmine, and dextrose 70% and found chromium concentrations were below the limit of detection but zinc ranged from 0.11 to 4.97 mg/L. Additionally, detectable chromium and zinc concentrations were seen with various lots of L-cysteine, potassium and sodium salts (chloride, acetate, and phosphate), calcium gluconate, and magnesium sulfate. The zinc contamination was thought to be a product of manufacturing procedures as it is present in many rubber stoppers and in the materials to produce glass. The authors suggested that the amount of contamination of chromium and zinc present in most pediatric parenteral nutrition solutions may exceed current recommendations, especially for infants less than 10 kg.<sup>2464</sup>

### Heparin

Flocculation of fat emulsion (Kabi-Vitrum) was reported during Y-site administration into a line used to infuse a parenteral nutrition admixture containing both calcium gluconate and heparin sodium. Subsequent evaluation indicated that the combination of calcium gluconate (0.46 and 1.8 mmol/125 mL) and heparin sodium (25 and 100 units/125 mL) in amino acids plus dextrose induced flocculation of the fat emulsion within 2 to 4 minutes at concentrations that resulted in no visually apparent flocculation in 30 minutes with either agent alone.<sup>1214</sup>

Calcium chloride quantities of 1 and 20 mmol normally result in slow flocculation of fat emulsion 20% over several hours. When heparin sodium 5 units/mL was added, the flocculation rate was accelerated greatly and a cream layer was observed visually in a few minutes. This effect was not observed when sodium ion was substituted for the divalent calcium.<sup>1406</sup>

Similar results were observed during simulated Y-site administration of heparin sodium into nine 3-in-1 nutrient admixtures having different compositions. Damage to the fat emulsion component was found to occur immediately, with the possible formation of free oil over time.<sup>2215</sup>

The destabilization of fat emulsion (Intralipid 20%) was also observed when administered simultaneously with a TPN admixture and heparin. The damage, detected by viscosity measurement, occurred immediately upon contact at the Y-site. The extent of the destabilization was dependent on the concentration of heparin and the presence of MVI Pediatric with its surfactant content. Additionally, phase separation was observed in 2 hours. The authors noted that TPN admixtures containing heparin should never be premixed with fat emulsion as a 3-in-1 total nutrient admixture because of this emulsion destabilization. The authors indicated their belief that the damage could be minimized during Y-site co-administration as long as the heparin was kept at a sufficiently low concentration (no visible separation occurred at a heparin concentration of 0.5 unit/mL) and the length of tubing between the Y-site and the patient was minimized.<sup>2282</sup>

However, because the damage to emulsion integrity has been found to occur immediately upon mixing with heparin in the presence of the calcium ions in TPN admixtures<sup>1214 2215 2282</sup> and no evaluation and documentation of the clinical safety of

using such destabilized emulsions has been performed, use of such damaged emulsions is suspect.

### Ranitidine

The stability of ranitidine hydrochloride has been evaluated in a number of TPN solutions with variable results. See Additive Compatibility table. The major mechanism of ranitidine hydrochloride decomposition is oxidation. A number of factors have been found to contribute to ranitidine hydrochloride instability in TPN solutions, including the presence or absence of antioxidants (such as sodium metabisulfite) in the amino acids, the addition of trace elements (which can catalyze ranitidine oxidation), solution pH, and type of plastic container used. In a study of ranitidine hydrochloride stability in several TPN solutions stored at 5°C, the drug was most stable in FreAmine III-based (contains sodium metabisulfite) admixtures with additives when packaged in multilayer gas impermeable plastic containers (Ultrastab) with about 8% loss in 28 days. In contrast, in ethylene vinyl acetate (EVA) bags, which are permeable to oxygen, losses of approximately 50% occurred in this time period. If Vamin 14 with no antioxidant present was used as the amino acid source, and the solution was packaged in EVA bags, ranitidine hydrochloride losses of approximately 65% occurred in 28 days. Similarly, the addition of air to the bags during compounding increases the extent of ranitidine hydrochloride oxidation substantially.<sup>2195</sup>

## Other Information

### Titrateable Acidity

The acidity of parenteral nutrition solutions can be a factor in the development of metabolic acidosis by a patient.<sup>577 851</sup> Titrateable acidity is a measure of the hydrogen ion content that must be neutralized to raise the pH to a given endpoint and is often expressed as milliequivalents of titrant per liter of reactant. In a study<sup>577</sup> of 5 amino acid injections and mixtures, the titrateable acidities were determined for pH 7.4 by titrating with 0.1220 N sodium hydroxide and 7.54% (0.898 M) sodium bicarbonate. The results are noted in Table 11.

**Table 11. Titrateable acidity of several amino acids products<sup>577</sup>**

	Titrateable Acidity	
	NaOH (mEq/L)	NaHCO <sub>3</sub> (mEq/L)
Aminosyn 7%	37	314
FreAmine II 8.5%	16.8	176
Travasol 8.5%	34.7	354
Travasol 8.5% with electrolytes	45.2	420

Corresponding (although somewhat lower) values were also obtained for 1:1 mixtures with dextrose 50%. It was concluded that use of sodium bicarbonate to adjust to pH 7.4 was not usually feasible given the large volumes of fluid and increased sodium ion required. However, smaller amounts could be used for smaller pH adjustments.<sup>577</sup>

## Aminocaproic Acid

AHFS 20:28.16

### Products

Aminocaproic acid is available as a 250-mg/mL concentration in 20-mL vials containing 5 g of drug with hydrochloric acid for pH adjustment. Aminocaproic acid injection is available with benzyl alcohol 0.9% as a preservative and also in preservative-free form.<sup>1(6/07) 4</sup>

### pH

The pH is adjusted to approximately 6.8 with a range of 6 to 7.6.<sup>1(6/07)</sup>

### Administration

Aminocaproic acid is administered by continuous intravenous infusion after dilution in a suitable infusion solution. Rapid intravenous injection of the undiluted drug should be avoided.<sup>1(6/07) 4</sup>

### Stability

Intact containers of aminocaproic acid injection should be stored at controlled room temperature. Freezing should be avoided.<sup>1(6/07) 4</sup>

# Aminophylline

AHFS 86:16

## Products

Aminophylline is available as a 25-mg/mL solution in 10-mL (250-mg) and 20-mL (500-mg) ampuls and vials for intravenous injection. Aminophylline is a 2:1 complex of theophylline and ethylenediamine. It contains excess ethylenediamine to ensure stability<sup>6</sup> and is approximately 79% theophylline by weight. Aminophylline 25 mg is equivalent to 19.7 mg of theophylline.<sup>1(11/06)</sup>

## pH

From 8.6 to 9.<sup>1(11/06)</sup>

## Osmolarity

The calculated osmolarity of the injection is 170 mOsm/L.<sup>1(11/06)</sup>

## Osmolality

The osmolality was determined to be 114 mOsm/kg by freezing-point depression.<sup>1071</sup>

The osmolality of aminophylline 250 mg was calculated for the following dilutions:<sup>1054</sup>

Diluent	Osmolality (mOsm/kg)	
	50 mL	100 mL
Dextrose 5%	300	291
Sodium chloride 0.9%	327	318

## Administration

Aminophylline may be administered by intravenous infusion or slow direct intravenous injection.<sup>1(11/06) 4</sup>

## Stability

The containers should be stored at controlled room temperature and protected from freezing and light.<sup>1(11/06) 4</sup> Containers of aminophylline should be inspected for particulate matter and discoloration prior to use. Do not use if crystals are present.<sup>1(11/06) 4</sup>

## pH Effects

Reports in the literature of aminophylline precipitating in acidic media do not apply to the dilute solutions found in intravenous

infusions. Aminophylline should not be mixed in a syringe with other components of an admixture but should be added separately.<sup>6</sup>

Because of the alkalinity of aminophylline-containing solutions, drugs known to be alkali labile should be avoided in admixtures.<sup>6</sup>

## Temperature Effects

Aminophylline under simulated summer conditions in paramedic vehicles was exposed to temperatures ranging from 26 to 38°C over 4 weeks. Analysis found no loss of the drug under these conditions.<sup>2562</sup>

## Light Effects

A study of aminophylline (Squibb) 50 mg/mL found no change in theophylline after 8 weeks of storage with exposure to fluorescent light.<sup>1231</sup>

## Syringes

Aminophylline (Abbott) 5 mg/mL in bacteriostatic water for injection containing benzyl alcohol 0.9% in plastic syringes (Becton Dickinson) exhibited 2 and 3% losses at 4 and 22°C, respectively, after 91 days of storage.<sup>1586</sup>

## Sorption

Aminophylline was shown not to exhibit sorption to polyvinyl chloride (PVC) bags and tubing, polyethylene tubing, Silastic tubing, and polypropylene syringes.<sup>536 606</sup>

## Filtration

Aminophylline 500 mg/L in dextrose 5% was passed through an Ivex-2 inline filter at a rate of 2 mL/min. No decrease in the aminophylline concentration occurred over the 8-hour study period.<sup>556</sup>

## Central Venous Catheter

Aminophylline (Abbott) 2.5 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

# Amiodarone Hydrochloride

**AHFS 24:04.04.20**

## Products

Amiodarone hydrochloride 50 mg/mL is available in 3-, 9-, and 18-mL vials. Each mL also contains polysorbate 80 100 mg, and benzyl alcohol 20.2 mg in water for injection.<sup>1(5/08)</sup>

## pH

The pH is reported to be 4.08.<sup>1053</sup>

## Administration

Amiodarone hydrochloride is a concentrate that is administered by intravenous infusion after dilution in a compatible diluent.<sup>3279</sup> Intravenous infusion at concentrations of 1 to 6 mg/mL is performed using a volumetric pump and a dedicated central venous catheter, when possible, with an inline filter; concentrations greater than 2 mg/mL require a central venous catheter.<sup>3279</sup> The injection contains polysorbate 80, a surface active agent that alters drop size. The drop size reduction may lead to substantial underdosage if a drop counter infusion set is used. Consequently, the drug must be delivered with a volumetric infusion pump.<sup>1(5/08) 1445</sup>

## Stability

Amiodarone hydrochloride should be stored at room temperature and protected from light and excessive heat. Light protection is not necessary during administration,<sup>1(5/08)</sup> but exposure to direct sunlight should be avoided.<sup>2258</sup> It is recommended that amiodarone hydrochloride be added only to dextrose 5%.<sup>1(5/08)</sup> Information on the drug's compatibility in sodium chloride 0.9% has been conflicting.<sup>1443 1031</sup> Solutions containing less than 0.6 mg/mL of amiodarone hydrochloride in dextrose 5% are unstable and should not be used.<sup>1442</sup>

## Precipitation

Amiodarone hydrochloride may precipitate when diluted. Studies found little or no precipitation when the formulation was diluted to very small or very large concentrations. In the middle range, however, at concentrations between 45 mg/mL (90% amiodarone hydrochloride formulation) and about 0.0025 mg/mL in phosphate buffer (pH 7.4), the drug concentration exceeds the solubility of amiodarone hydrochloride in the mixture. Precipitation may occur immediately or on standing. Such precipitation may occur when the drug enters the bloodstream, contributing to the phlebitis associated with amiodarone hydrochloride.<sup>1818 1819</sup>

The aqueous solubility of amiodarone hydrochloride is not substantially altered over the pH range of 1.5 to 7.5,<sup>925</sup> but precipitation may occur in alkaline media.<sup>791 1032</sup>

Amiodarone hydrochloride (Wyeth-Ayerst) 1.2 mg/mL in 250 mL of dextrose 5% has been reported to develop cloudiness upon standing when prepared in glass evacuated bottles (Abbott). The precipitation was attributed to the acetate buffers present in the small amount of residual fluid left in evacuated bottles from steam sterilization.<sup>1982</sup>

## Syringes

Amiodarone hydrochloride (Sanofi) 600 mg/24 mL in dextrose 5% in a 50-mL polypropylene syringe (BD) was physically stable for 48 hours at room temperature.<sup>3545</sup>

## Sorption

At concentrations of 1 to 6 mg/mL in dextrose 5% in polyolefin or glass containers, amiodarone hydrochloride is physically compatible, with no loss in 24 hours. In PVC containers, however, the amiodarone hydrochloride loss due to sorption occurs; acceptable potency (less than 10% loss) exists for 2 hours. Consequently, the manufacturer recommends that all infusions longer than 2 hours be made in glass or polyolefin containers only.<sup>1(5/08)</sup>

Similarly, amiodarone hydrochloride is lost due to sorption to PVC infusion sets.<sup>1(5/08) 1443</sup> However, the manufacturer states that these losses are accounted for by the recommended dosage schedule. Consequently, PVC sets should be used with this drug, but the recommended infusion regimen must be followed.<sup>1(5/08)</sup>

Amiodarone hydrochloride 1 mg/mL in dextrose 5% in VISIV polyolefin bags was tested for 24 hours at room temperature near 23°C. Little or no loss due to sorption was found within the 24-hour study period.<sup>2660</sup>

## Plasticizer Leaching

Amiodarone hydrochloride leaches diethylhexyl phthalate (DEHP) plasticizer from PVC tubing. The degree of plasticizer leaching depends on the concentration and rate of administration. Higher concentrations and slower administration rates leach more plasticizer.<sup>1(5/08)</sup>

## Filtration

Amiodarone hydrochloride (Labaz) 0.6 mg/mL in dextrose 5% and sodium chloride 0.9% was filtered through a 0.22- $\mu$ m cellulose ester membrane filter (Ivex-HP, Millipore) over 6 hours. No significant drug loss due to binding to the filter was noted.<sup>1034</sup>

## Amisulpride

AHFS 56:22.92

### Products

Amisulpride is available in single-dose vials containing 5 mg of the drug.<sup>3548</sup> Each mL of solution contains amisulpride 2.5 mg, citric acid monohydrate 9.35 mg, sodium chloride 1.8 mg, and trisodium citrate dihydrate 16.32 mg in water for injection.<sup>3548</sup> Hydrochloric acid and sodium hydroxide also may have been added to adjust the pH.<sup>3548</sup>

### pH

The pH of amisulpride 2.5-mg/mL injection solution ranges from 4.75 to 5.25.<sup>3548</sup>

### Osmolality

The osmolality of amisulpride 2.5-mg/mL injection solution ranges from 250 to 330 mOsmol/kg.<sup>3548</sup>

### Trade Name(s)

Barhemsys

### Administration

Amisulpride is administered as an intravenous injection over 1 to 2 minutes.<sup>3548</sup> Dilution of the injection solution prior to administration is not required.<sup>3548</sup> The intravenous line used to administer amisulpride may be flushed with either dextrose 5% or sodium chloride 0.9% prior to and following administration of the drug.<sup>3548</sup>

### Stability

Amisulpride injection is a clear, colorless solution.<sup>3548</sup> Intact vials should be stored at controlled room temperature in the original carton to protect from light.<sup>3548</sup> Amisulpride should be administered within 12 hours after removal from the original carton since the drug is subject to photodegradation.<sup>3548</sup>

# Ammonium Chloride

AHFS 40:04

## Products

Ammonium chloride additive solution is available in 20-mL vials containing 5.35 g of ammonium chloride, which provides 100 mEq (5 mEq/mL) of  $\text{NH}_4^+$  and  $\text{Cl}^-$  ions. The solution also contains 2 mg/mL of disodium edetate as a stabilizer and hydrochloric acid to adjust the pH. The additive solution is intended to be used only after further dilution in a larger volume of sodium chloride 0.9% injection.<sup>1(8/06)</sup>

One gram of ammonium chloride contains 18.7 mEq each of ammonium and chloride ions.<sup>4</sup>

## pH

About 4.4 with a range of 4 to 6.<sup>1(8/06)</sup>

## Osmolarity

10 mOsm/mL (calculated).<sup>1(8/06)</sup>

## Administration

Ammonium chloride injection is a concentrate that is generally administered by slow intravenous infusion after dilution of one or two vials (100 to 200 mEq) in 500 to 1000 mL of sodium chloride 0.9% injection. The infusion rate in adults of the diluted solution should not exceed 5 mL/min.<sup>1(8/06)</sup>

## Stability

Store at controlled room temperature and protect from freezing. Highly concentrated solutions of ammonium chloride may crystallize when exposed to low temperatures. If such crystallization does occur, warming to room temperature in a water bath is recommended.<sup>1(8/06)</sup> <sup>4</sup>

Ammonium chloride is stated to be incompatible with alkalis and their carbonates.<sup>4</sup>

## Amoxicillin Sodium

AHFS 8:12.16.08

### Products

Amoxicillin sodium is available as a powder in vials containing the equivalent of amoxicillin 250 mg, 500 mg, and 1 g.<sup>3553 3554 3555</sup>

For intravenous injection, the 250-mg, 500-mg, and 1-g vials may be reconstituted with 5, 10, and 20 mL, respectively, of sterile water for injection when the dose reflects the entire contents of a vial and the entire vial contents are subsequently withdrawn.<sup>3553 3554 3555</sup> One manufacturer states that 500-mg and 1-g vials also may be reconstituted with 5 mL of sterile water for injection when the dose reflects the entire contents of the vial and the entire vial contents are subsequently withdrawn.<sup>3555</sup>

Alternatively, the 250-mg vials may be reconstituted with 4.8 mL of sterile water for injection to yield a 50-mg/mL solution, the 500-mg vials may be reconstituted with 4.6 mL of sterile water for injection to yield a 100-mg/mL solution, and the 1-g vials may be reconstituted with 4.2 mL of sterile water for injection to yield a 200-mg/mL solution.<sup>3555</sup> This allows for calculation of the volume required for a dose when only the partial contents of the vial are intended.<sup>3555</sup>

For intravenous infusion, the reconstituted drug should be added to a compatible intravenous infusion solution (e.g., using a minibag or an in-line burette).<sup>3553 3554 3555</sup> (See Solution Compatibility.)

For intramuscular injection, 250-mg vials should be reconstituted with 2 mL of sterile water for injection<sup>3555</sup> and 500-mg vials should be reconstituted with 2<sup>3555</sup> or 2.5 mL of sterile water for injection.<sup>3553</sup> Lidocaine hydrochloride (e.g., 1%) or procaine hydrochloride 0.5% injection solution (no longer commercially available in the US) may be used in place of sterile water for injection for reconstitution of the drug for intramuscular administration.<sup>3553 3555</sup> Vials containing 1 g of amoxicillin should be reconstituted with 4 mL of sterile water for injection<sup>3555</sup> or 2.5 mL of lidocaine hydrochloride injection solution for administration by intramuscular injection.<sup>3554</sup>

### Final volumes of reconstituted amoxicillin sodium for intramuscular injection

Vial Size	Volume of Diluent	Final Volume
250 mg	2 mL	2.2 mL
500 mg	2 mL	2.4 mL
500 mg	2.5 mL	2.9 mL
1 g	2.5 mL	3.3 mL
1 g	4 mL	4.8 mL

### Sodium Content

Sodium content in amoxicillin sodium vials varies;<sup>3553 3554 3555</sup> specific product labeling should be consulted for additional formulation details.

### Trade Name(s)

Amoxil, Clamoxyl, Ibiamax

### Administration

Amoxicillin sodium may be administered by slow direct intravenous injection over 3 to 4 minutes, intermittent intravenous infusion over 20 to 30 or 30 to 60 minutes, or intramuscular injection.<sup>3553 3554 3555</sup> Intramuscular administration should be considered only when the intravenous route is not possible or is less appropriate for the patient.<sup>3553 3554</sup>

### Stability

Intact vials of amoxicillin sodium should be stored at or below 25°C,<sup>3553 3554 3555</sup> at least one manufacturer states the vials should be protected from light.<sup>3555</sup> After reconstitution with sterile water for injection, a transient pink color or slight opalescence may appear.<sup>3553 3554 3555</sup> Reconstituted solutions are normally colorless or a pale straw color.<sup>3553 3554 3555</sup> The reconstituted solution for intramuscular administration should be administered immediately<sup>3553 3554</sup> or within 1 hour<sup>3555</sup> after reconstitution. The reconstituted solution for direct intravenous injection should be administered within 20 minutes<sup>3553 3554</sup> or 1 hour<sup>3555</sup> after reconstitution. For intravenous infusion, the reconstituted solution should be added to the infusion solution without delay<sup>3553 3554</sup> and should be used immediately<sup>3553 3554</sup> (e.g., within 1 hour<sup>3555</sup>), though manufacturers provide stability data for the drug in various infusion solutions.<sup>3553 3554 3555</sup> (See Solution Compatibility.)

### Concentration Effects

Degradation of amoxicillin is concentration dependent; the higher the concentration, the less stable the drug.<sup>3556</sup>

Amoxicillin sodium prepared at an amoxicillin concentration of 50 mg/mL is substantially less stable in all infusion solutions than at lower concentrations of 10 or 20 mg/mL.<sup>1469</sup>

Amoxicillin sodium prepared at an amoxicillin concentration of 125 mg/mL in sterile water for injection in Infusor elastomeric pumps (Baxter) demonstrated greater than 10% loss within about 1 hour at 24 to 26°C.<sup>3556</sup> Amoxicillin sodium prepared at an amoxicillin concentration of 50 mg/mL in sterile water for injection in FOLFusor elastomeric pumps (Baxter) demonstrated greater than 10% loss within about 5 hours at 24 to 26°C.<sup>3556</sup>

### Temperature Effects

Degradation of amoxicillin also is temperature dependent; the higher the temperature, the less stable the drug.<sup>3556</sup> The rate of degradation of amoxicillin sodium prepared at an amoxicillin concentration of 125 mg/mL in sterile water for injection in Infusor elastomeric pumps (Baxter) was 1.92 and 3.29% per hour at 5 and 37°C, respectively.<sup>3556</sup>

## Freezing Solutions

Amoxicillin sodium prepared at an amoxicillin concentration of 10 mg/mL in sterile water for injection was unstable when stored frozen at 0 and –20°C but was stable for 13 days when stored below –30°C. Amoxicillin sodium prepared at an amoxicillin concentration of 10 mg/mL in sterile water for injection was stable for only 2 days at 0°C in the unfrozen state.<sup>1470</sup>

Amoxicillin sodium prepared at an amoxicillin concentration of 10 mg/mL in sodium chloride 0.9% was stable for 10.5 days at 0°C (unfrozen) and for 14 hours when frozen at –19°C; in dextrose 5%, the comparative times were 12.5 and 8.4 hours, respectively.<sup>1471</sup>

The processes of freezing and thawing increase the degradation rate of amoxicillin sodium prepared at an amoxicillin concentration of 10 mg/mL in sodium chloride 0.9% in polyvinyl chloride (PVC) bags (Travenol). Freezing and thawing (natural or microwave) could account for a 5 to 10% loss of amoxicillin; the losses will be affected by the time to reach the equilibrium frozen temperature.<sup>1472</sup>

## Elastomeric Reservoir Pumps

Amoxicillin sodium (Panpharma) prepared at an amoxicillin concentration of 25 mg/mL in equal volumes of sterile water for injection and sodium chloride 0.9% (Braun) in Accufuser elastomeric pumps (Wym) was stable for 12 hours at 18 to 26°C and 24 hours at 4 to 8°C.<sup>3556</sup>

## Sorption

Amoxicillin sodium was shown not to exhibit sorption to PVC bags and tubing, polyethylene tubing, Silastic tubing, polypropylene syringes, and trilayer bags of polyethylene, polyamide, and polypropylene.<sup>536 606 1918</sup>

## Filtration

Amoxicillin sodium prepared at an amoxicillin concentration of 1.98 mg/mL in sodium chloride 0.9% did not exhibit significant drug loss due to sorption to a 0.22- $\mu$ m cellulose ester membrane filter (Ivex-HP, Millipore).<sup>1034</sup>

## Additional Compatibility Information

### Infusion Solutions

One manufacturer states that satisfactory concentrations of the drug are retained when administration of amoxicillin sodium (Amoxil, GlaxoSmithKline) prepared at an amoxicillin concentration of 10 g/L in sterile water for injection and compound sodium chloride (Ringer's solution) is completed within 6 and 2 hours, respectively, at 20°C.<sup>3553 3554</sup> Dilutions of the drug in compound sodium lactate (Hartmann's solution) and in dextrose 4% in sodium chloride 0.18% are unstable after 30 minutes at 20°C.<sup>3553 3554</sup>

One manufacturer states that a satisfactory degree of amoxicillin activity is retained when amoxicillin sodium (Ibiamox, Douglas) is diluted in compound sodium chloride (Ringer's solution), sodium lactate (concentration not specified), compound

sodium lactate (Hartmann's solution), and dextrose 4% in sodium chloride (concentration not specified) for 6, 3, 3, and 1 hour, respectively, at room temperature.<sup>3555</sup>

### Peritoneal Dialysis Solutions

The stability of amoxicillin (Aspen Pharmacare) 125 mg/L in pH-neutral Balance (Fresenius), icodextrin-based Extraneal (Baxter), and dextrose-based Dianeal PD-4 (Baxter) peritoneal dialysis solutions was evaluated.<sup>2984</sup> At 4, 25, and 37°C, amoxicillin was stable in Balance for 336, 12, and 12 hours, respectively; in Extraneal for 336, 48, and 24 hours, respectively; and in Dianeal PD-4 for 336, 72, and 24 hours, respectively.<sup>2984</sup>

Amoxicillin (Fisamox, Aspen Pharmacare) 1 g in 2 L of Dianeal PD-4 with dextrose 2.5% (Baxter) exhibited 10% drug loss over 6 hours at 37°C.<sup>3108</sup>

## Amoxicillin Sodium–Clavulanate Potassium

AHFS 8:12.16.08

Co–amoxiclav

### Products

The fixed combination of amoxicillin sodium–clavulanate potassium is available as a powder for injection in single-use vials or bottles containing 600 mg (amoxicillin 500 mg as the sodium salt plus clavulanate potassium equivalent to clavulanic acid 100 mg), 1.2 g (amoxicillin 1 g as the sodium salt plus clavulanate potassium equivalent to clavulanic acid 200 mg), and 2.2 g (amoxicillin 2 g as the sodium salt plus clavulanate potassium equivalent to clavulanic acid 200 mg).<sup>3558 3559 3560</sup> The 600-mg and 1.2-g vials should be reconstituted with 10 and 20 mL, respectively, of sterile water for injection, resulting in an amoxicillin to clavulanic acid ratio of 5:1.<sup>3358 3359 3360</sup> The 2.2-g vials should be reconstituted with 20 mL of sterile water for injection, resulting in an amoxicillin to clavulanic acid ratio of 10:1.<sup>3558</sup>

For administration by intravenous infusion, the reconstituted solution containing 500 mg of amoxicillin plus 100 mg of clavulanic acid should be diluted in 50 mL of, or to 50 mL with, a compatible diluent and the reconstituted solution containing 1 or 2 g of amoxicillin plus 200 mg of clavulanic acid should be diluted in 100 mL of, or to 100 mL with, a compatible diluent.<sup>3558 3559 3560</sup> (See Solution Compatibility.)

### Sodium and Potassium Content

Sodium and potassium content of amoxicillin sodium–clavulanate potassium vials is variable.<sup>3558 3559 3560</sup> Several manufacturers state that 600-mg vials contain 1.4 mmol of sodium and 0.5 mmol of potassium.<sup>3558 3560</sup> Manufacturers state that 1.2-g vials contain either 2.7<sup>3558 3560</sup> or 3.1 mmol of sodium<sup>3359</sup> and 1 mmol of potassium. One manufacturer states that 2.2-g vials contain 5.5 mmol of sodium and 1 mmol of potassium.<sup>3558</sup> Specific product labeling should be consulted for additional formulation details.

### Trade Name(s)

Augmentin, Clavulin, Flanamox

### Administration

Amoxicillin sodium–clavulanate potassium is administered intravenously, either by slow injection over 3 to 4 minutes directly into a vein or via intravenous tubing or by intermittent infusion over 30 to 40 minutes following dilution.<sup>3558 3559 3560</sup> Some patients (e.g., pediatric patients younger than 3 months of age) should receive the drug only by intravenous infusion.<sup>3558</sup> Reconstituted solutions prepared from 2.2-g vials and resulting

in an amoxicillin to clavulanic acid ratio of 10:1 should be administered only by intravenous infusion following dilution.<sup>3558</sup> Amoxicillin sodium–clavulanate potassium is not suitable for intramuscular administration.<sup>3558 3559 3560</sup>

### Stability

Intact vials of the fixed combination of amoxicillin sodium–clavulanate potassium should be stored at 15 to 30°C<sup>3558</sup> or at a temperature not exceeding 25°C.<sup>3559 3560</sup> After reconstitution with sterile water for injection, a transient pink color may appear,<sup>3558 3559 3560</sup> with solutions quickly becoming clear again thereafter.<sup>3558</sup> Reconstituted solutions are normally colorless or a yellow color.<sup>3559 3560</sup> The injection should be administered by slow intravenous injection, if appropriate, or further diluted for intravenous infusion within 15<sup>3558</sup> or 20 minutes<sup>3559 3560</sup> after reconstitution.

Amoxicillin–clavulanic acid is less stable in dextrose, dextran, or bicarbonate-containing infusion solutions and should not be mixed with such solutions.<sup>3559 3560</sup> Manufacturers state that amoxicillin–clavulanic acid also should not be added to proteinaceous fluids (e.g., protein hydrolysates) or intravenous fat emulsions.<sup>3559 3560</sup>

The stability of amoxicillin–clavulanic acid is governed by the more rapid degradation of clavulanic acid compared with amoxicillin.<sup>1474</sup>

Stability of amoxicillin–clavulanic acid also is concentration dependent,<sup>3559 3560</sup> amoxicillin–clavulanic acid is less stable in high concentrations. Therefore, it is suggested that reconstituted solutions be used immediately or diluted without delay.<sup>1474 3558 3559 3560</sup> If a more concentrated solution of amoxicillin–clavulanic acid is required, one manufacturer states that the stability period should be adjusted accordingly.<sup>3559 3560</sup>

### Freezing Solutions

The fixed combination of amoxicillin sodium–clavulanate potassium 1.2 g (amoxicillin 1 g as the sodium salt plus clavulanate potassium equivalent to clavulanic acid 200 mg) reconstituted with 20 mL and diluted in 100 mL of sterile water for injection was frozen at –20°C for 4 hours, followed by microwave thawing. Solutions retained only 65% of the initial clavulanic acid content.<sup>1474</sup>

### Sorption

Amoxicillin–clavulanic acid did not undergo sorption to polyvinyl chloride (PVC) containers or administration tubing.<sup>1474</sup>

## Additional Compatibility Information

### Infusion Solutions

One manufacturer (Sandoz Canada) states that satisfactory concentrations of the drug are retained for 1 hour at 25°C when prepared as directed in sterile water for injection, compound sodium lactate (Hartmann's solution), and sodium chloride with potassium chloride (concentrations unspecified).<sup>3558</sup>

One manufacturer (GlaxoSmithKline New Zealand) states that satisfactory concentrations of the drug are retained for

3 hours at 25°C when prepared as directed in compound sodium lactate (Hartmann's solution) and sodium chloride with potassium chloride (concentrations unspecified) and for 4 hours at 25°C and 8 hours at 5°C when prepared as directed in sterile water for injection.<sup>3559</sup>

One manufacturer (GlaxoSmithKline UK) states that satisfactory concentrations of the drug are retained for 2 hours at 25°C when prepared as directed in compound sodium lactate (Hartmann's solution) and for 3 hours at 25°C and 8 hours at 5°C when prepared as directed in sterile water for injection.<sup>3560</sup>

## Amphotericin B

AHFS 8:14.28

### Products

Amphotericin B is available in vials containing 50 mg of drug with sodium desoxycholate 41 mg and sodium phosphates 20.2 mg. Reconstitute with 10 mL of sterile water for injection without preservatives and shake until a clear colloidal dispersion is obtained. The resultant concentration is 5 mg/mL of amphotericin B. Use only sterile water for injection without preservatives for reconstitution because other diluents, such as sodium chloride 0.9% or solutions containing a bacteriostatic agent such as benzyl alcohol, may result in the precipitation of the antibiotic. For infusion, amphotericin B must be further diluted with dextrose 5% with a pH above 4.2.<sup>1(4/07) 4</sup>

Although various lipid complex and liposomal products of amphotericin B exist, they are sufficiently different from conventional amphotericin B formulations that extrapolating information to or from the other forms would be inappropriate.

### pH

The pH of amphotericin B (Squibb) 100 mg/L in dextrose 5% has been reported as 5.7.<sup>149</sup>

### Osmolality

The osmolality of amphotericin B (Squibb) 0.1 mg/mL in dextrose 5% was determined to be 256 mOsm/kg.<sup>1375</sup>

### Trade Name(s)

Fungizone

### Administration

Amphotericin B is administered by slow intravenous infusion over approximately 2 to 6 hours. The recommended concentration of the infusion is 0.1 mg/mL.<sup>1(4/07) 4</sup> The drug has also been given intra-articularly, intrathecally, intrapleurally, and by irrigation.<sup>4</sup>

**CAUTION: Care should be taken to ensure that the correct drug product, dose, and administration procedure are used and that no confusion with other products occurs.**

### Stability

Store intact vials at 2 to 8°C and protect from light.<sup>1(4/07) 4</sup> The manufacturer indicates that a 5 to 10% potency loss occurs in 1 month at room temperature.<sup>1433</sup>

Amphotericin B reconstituted with sterile water for injection without preservatives and stored in the dark is stable for 24 hours at room temperature and for 1 week under refrigeration at 2 to 8°C.<sup>1(4/07) 4 108</sup> One report indicates that aqueous solutions may be stable for over a week at both 5 and 28°C.<sup>352</sup>

Reconstituted amphotericin B may be added to dextrose 5% with a pH above 4.2. Buffers present in the formulation raise the pH of the admixture. If the dextrose 5% has a pH less than 4.2, additional buffer must be added.<sup>1(4/07) 4</sup> One or 2 mL of a buffer solution composed of dibasic sodium phosphate anhydrous 1.59 g

and monobasic sodium phosphate anhydrous 0.96 g in water for injection is brought to 100 mL. The buffer solution should be sterilized either by filtration or by autoclaving for 30 minutes at 121°C at 15 pounds pressure.<sup>1(4/07)</sup> Failure to sterilize this buffer solution coupled with prolonged storage at room temperature has resulted in severe infection.<sup>328</sup>

Amphotericin B was reported to precipitate when added to some evacuated containers due to a small residual amount of fluid that may have acetic acid and sodium acetate buffer or sodium chloride 0.9% solution. Only evacuated containers with residual sterile water should be used for preparing amphotericin B admixtures.<sup>1232</sup>

In an effort to reduce toxicity, amphotericin B has been admixed in Intralipid instead of the more usual dextrose 5%.<sup>1809 1810 1811 2178</sup> However, amphotericin B 0.75 mg/kg/day administered using this approach in 250 mL of Intralipid 20% has been associated with acute pulmonary toxicities, including sudden onset of coughing, tachypnea, cyanosis, and deterioration of oxygen saturation following administration. The temporal relationship between the drug administration and respiratory symptoms suggested a causal relationship. Furthermore, no reduction in renal toxicity or other side effects was observed. It was concluded amphotericin B should not be administered in Intralipid.<sup>2177</sup>

At a concentration of 0.6 mg/mL in Intralipid 10 or 20%, amphotericin B precipitates immediately or almost immediately. The precipitate is not visible to the unaided eye because of the emulsion's dense opacity. Particle size evaluation found thousands of particles larger than 10 µm per mL. In dextrose 5%, very few particles were larger than 10 µm. Centrifuging the Intralipid admixtures resulted in rapid visualization of the precipitate as a mass at the bottom of the test tubes.<sup>1808</sup>

However, amphotericin B precipitation is observed in fat emulsion within 2 to 4 hours without centrifuging. In concentrations ranging from 90 mg to 2 g/L in Intralipid 20%, amphotericin B precipitate is easily seen as yellow particulate matter on the bottom of the lipid emulsion containers.<sup>1872 1988</sup> Damage to the emulsion integrity with creaming has also been reported.<sup>1987</sup>

In other reports, the appearance of problems was observed in as little as 15 minutes, and actual amphotericin B precipitate formed within 20 minutes of mixing. Analysis of the precipitate confirmed its identity as amphotericin B. The authors hypothesized that amphotericin B precipitates as a consequence of the excipient desoxycholic acid, which is an anion, attracting oppositely charged choline groups from the egg yolk components of the fat emulsion. As a consequence, desoxycholic acid and phosphatidylcholine form a precipitate and insufficient surfactant remains to keep the amphotericin B dispersed.<sup>2204 2205</sup>

### pH Effects

The pH range for optimum clarity and stability is 6 to 7.<sup>148</sup> At a pH of less than approximately 6, the colloidal dispersion may

become turbid.<sup>40 148</sup> Colloidal particles tend to coagulate rapidly at a pH of less than 5.<sup>4</sup>

### Light Effects

Although the manufacturer recommends light protection for aqueous solutions of amphotericin B,<sup>1(4/07)</sup> several reports indicate that for short-term exposure of 8 to 24 hours, little difference in potency is observed between light-protected and light-exposed solutions.<sup>150 335 353</sup> Longer exposure periods<sup>150</sup> or higher intensity light exposure<sup>2414</sup> may result in unacceptable potency losses, however.

### Elastomeric Reservoir Pumps

Amphotericin B (Lymphomed) 0.25 mg/mL in dextrose 5% was evaluated for binding potential to natural rubber elastomeric reservoirs (Baxter). No binding was found after storage for 2 weeks at 35°C with gentle agitation.<sup>2014</sup>

### Filtration

Various studies have assessed the effects of filtration on the amphotericin B colloidal dispersion with differing results. The use of a 0.22- $\mu$ m membrane filter was reported to be unacceptable with colloidal solutions adjusted to pH 4.7, 5.6, and 6.5. The concentration of amphotericin B in the filtrate decreased substantially after several hours. A 0.45- $\mu$ m filter was satisfactory for infusions with a pH of 6.5, but the results at pH 5.6 were inconclusive. At pH 5.6 and 6.5, 1- and 5- $\mu$ m filters both

proved satisfactory in that they did not reduce the concentration of amphotericin B. For the turbid mixtures resulting at pH 4.7, however, all filters sharply reduced the concentration.<sup>148</sup> A report tended to support this finding for the 0.22- $\mu$ m filter. At pH 5.7, fine particles of amphotericin B formed and were retained by the 0.22- $\mu$ m filter.<sup>149</sup> No appreciable reduction in concentration with a 0.45- $\mu$ m filter was found; but with a 0.22- $\mu$ m filter, after 1 hour the concentration of amphotericin B delivered was about 30% of the initial concentration.<sup>152</sup> When amphotericin B 50 mg/500 mL in dextrose 5% was filtered through a 0.22- $\mu$ m circular cellulose ester membrane (Swinnex) or a 0.22- $\mu$ m cylindrical cellulose ester filter (Ivex-2), the flow rate decreased dramatically after passage of as little as 30 mL. Flow ceased altogether after 100 to 200 mL. The last sample filtered contained no drug. With a 0.45- $\mu$ m circular cellulose ester membrane (Swinnex), no loss of activity was determined after filtration of 200 mL. However, the flow rate had decreased.<sup>598</sup> On the other hand, no significant difference in the amount or concentration of amphotericin B in dextrose 5% with phosphate buffer was found after filtration with 0.22-, 0.45-, and 5- $\mu$ m filters.<sup>151</sup>

For amphotericin B infusions, only filters with a pore size not less than 1  $\mu$ m should be used for filtration.<sup>1(4/07) 4 148</sup> This would allow a margin for error that would compensate for possible variations in particle size.<sup>148</sup> Also, limiting the use of filtration to situations where it is believed to be necessary has been recommended.<sup>598 599</sup>

## Amphotericin B Lipid Complex

AHFS 8:14.28

### Products

Amphotericin B lipid complex is available in single-use 20-mL vials containing amphotericin B complexed with 2 phospholipids in a 1:1 drug to lipid molar ratio; the injection is an opaque, yellow suspension.<sup>3072</sup> Each mL of the suspension contains amphotericin B 5 mg, L- $\alpha$ -dimyristoylphosphatidylcholine (DMPC) 3.4 mg, L- $\alpha$ -dimyristoylphosphatidylglycerol (DMPG) 1.5 mg, and sodium chloride 9 mg in water for injection.<sup>3072</sup>

To prepare the infusion, each vial should first be gently shaken until no yellow sediment is visible on the bottom of the vial.<sup>3072</sup> The appropriate dose should be withdrawn from the necessary number of vials using 1 or more syringes equipped with 18-gauge needles.<sup>3072</sup> The 18-gauge needle should then be removed from the syringe and replaced with the 5- $\mu$ m filter needle that is supplied with each vial of the drug, and the drug suspension should be transferred into an infusion bag of dextrose 5%.<sup>3072</sup> One filter needle may be used to filter up to 4 vials of the drug.<sup>3072</sup> The final concentration of the drug diluted for infusion should be 1 mg/mL, although more concentrated infusions of 2 mg/mL may be used in some cases (e.g., pediatric patients, patients with cardiovascular disease).<sup>3072</sup>

Although other amphotericin B products exist, they are sufficiently different from amphotericin B lipid complex that extrapolating information to or from other forms is inappropriate.<sup>3072</sup>

### pH

5 to 7.<sup>3072</sup>

### Trade Name(s)

Abelcet

### Administration

Amphotericin B lipid complex diluted to a concentration of 1 or 2 mg/mL in dextrose 5% is administered by intravenous infusion at a rate of 2.5 mg/kg/hr.<sup>3072</sup> The infusion bag should be

shaken just prior to administration until the contents are thoroughly mixed.<sup>3072</sup> The admixture should not be used if evidence of foreign matter is present.<sup>3072</sup> If the infusion time exceeds 2 hours, the infusion bag should be shaken every 2 hours to mix the remaining contents.<sup>3072</sup> If an existing line is used to administer amphotericin B lipid complex, the line should be flushed with dextrose 5% prior to administration, otherwise a separate line should be used.<sup>3072</sup> **CAUTION: Care should be taken to ensure that the correct drug product, dose, and administration procedure are used and that no confusion with other products occurs.**

### Stability

Intact vials of amphotericin B lipid complex are stored at 2 to 8°C.<sup>3072</sup> Vials should be kept in the original carton until time of use to protect from light and should not be frozen.<sup>3072</sup>

The manufacturer states that amphotericin B lipid complex diluted in dextrose 5% for administration may be stored for up to 48 hours at 2 to 8°C with an additional 6 hours at room temperature.<sup>3072</sup> The manufacturer also has confirmed that limited stability studies indicate that amphotericin B lipid complex 1 mg/mL in dextrose 5% is stable for up to 10 days stored at room temperature.<sup>3074</sup>

Amphotericin B lipid complex should not be mixed with saline or other electrolyte solutions.<sup>3072</sup>

### Freezing Solutions

Admixtures of amphotericin B lipid complex in dextrose 5% should not be frozen.<sup>3072</sup>

### Filtration

The manufacturer states that amphotericin B lipid complex is to be prepared using the 5- $\mu$ m filter needle provided with the drug; however, the admixture should not be administered using an inline filter.<sup>3072</sup> Each 5- $\mu$ m filter needle provided with the drug may be used to filter up to 4 vials of the drug.<sup>3072</sup>

**Additional Compatibility Information****Peritoneal Dialysis Solutions**

Amphotericin B lipid complex (Abelcet, The Liposome Company) was evaluated for stability in Dianeal PD-1 with dextrose 1.5% (Baxter) and Dianeal PD-1 with dextrose 4.25% (Baxter) at concentrations of 0.5 mg/L, 2 mg/L, and 10 mg/L, with bags of each concentration stored at 4, 25, and 37°C.<sup>3073</sup> Although no visual changes were observed throughout the study period, results of the nuclear magnetic resonance (NMR) spectroscopy analysis demonstrated important changes in the resonances associated with the lipid component of the formulation, suggesting decomposition of the lipid component of the drug and/or bag adherence.<sup>3073</sup>

## Amphotericin B Liposomal

AHFS 8:14.28

### Products

Amphotericin B liposomal for injection is available as a lyophilized powder in vials containing the equivalent of amphotericin B 50 mg; the vial also contains hydrogenated soy phosphatidylcholine 213 mg, cholesterol 52 mg, distearoylphosphatidylglycerol 84 mg, and alpha tocopherol 0.64 mg, which form the liposomal membrane.<sup>3068</sup> Amphotericin B is intercalated into the liposomal membrane to form liposomes that are less than 100 nm in diameter.<sup>3068</sup> The vial also contains sucrose 900 mg and disodium succinate hexahydrate 27 mg.<sup>3068</sup>

Vials should be reconstituted only with 12 mL of sterile water for injection.<sup>3068</sup> No other diluent should be used because of potential drug precipitation.<sup>3068</sup> After addition of the sterile water for injection, vials should be shaken vigorously for 30 seconds to yield a liposomal suspension concentrate of amphotericin B 4 mg/mL.<sup>3068</sup> The vial should be visually inspected for particulate matter and shaken until completely dispersed.<sup>3068</sup>

To prepare for administration, the volume of reconstituted concentrate used to prepare the dose should be passed through the provided disposable 5- $\mu$ m filters into an appropriate volume of dextrose 5%, using 1 filter per vial.<sup>3068</sup> The final concentration of the drug diluted for infusion generally should be 1 to 2 mg/mL, although lower concentrations of 0.2 to 0.5 mg/mL may be used for infants and small children.<sup>3068</sup>

Although other amphotericin B products exist, they are sufficiently different from amphotericin B liposomal that extrapolating information to or from other forms is inappropriate.<sup>3068</sup>

### pH

From 5 to 6.<sup>3068</sup>

### Trade Name(s)

AmBisome

### Administration

Amphotericin B liposomal is administered by intravenous infusion following dilution in dextrose 5% using a controlled infusion device over approximately 120 minutes.<sup>3068</sup> The administration time may be reduced to 60 minutes for patients who tolerate the infusion well.<sup>3068</sup> If an existing line is used to administer amphotericin B liposomal, the line should be flushed with dextrose

5% prior to administration, otherwise a separate line must be used.<sup>3068</sup> **CAUTION:** Care should be taken to ensure that the correct drug product, dose, and administration procedure are used and that no confusion with other products occurs.

### Stability

Intact vials of amphotericin B liposomal for injection are stored at room temperatures up to 25°C.<sup>3068</sup> The reconstituted concentrate is a yellow, translucent suspension.<sup>3068</sup>

The manufacturer states that the reconstituted concentrate may be stored at 2 to 8°C for up to 24 hours.<sup>3068</sup> The reconstituted concentrate should be protected from freezing.<sup>3068</sup> Vials contain no preservative; partially used vials should be discarded.<sup>3068</sup> The manufacturer also has confirmed that amphotericin B liposomal at a concentration of 4 mg/mL in sterile water for injection in the original glass vial is stable for 14 days at 2 to 8°C and protected from light.<sup>3069</sup>

The manufacturer states that administration of amphotericin B liposomal should begin within 6 hours of dilution in dextrose 5%.<sup>3068</sup> However, the manufacturer also has indicated that the drug diluted in dextrose 5% for administration is stable for longer time periods.<sup>3069</sup> (See Solution Compatibility.)

The manufacturer states that amphotericin B liposomal should not be mixed with saline or solutions containing bacteriostatic agents.<sup>3068</sup>

### Syringes

The manufacturer states that amphotericin B liposomal 4 mg/mL packaged in syringes is stable for 14 days stored at 2 to 8°C and protected from light.<sup>3069</sup>

### Filtration

The volume of reconstituted concentrate of amphotericin B liposomal used to prepare the dose should be passed through the disposable 5- $\mu$ m filter (provided with each vial of drug) into an appropriate volume of dextrose 5% for dilution, using 1 filter per vial.<sup>3068</sup>

The manufacturer states that amphotericin B liposomal diluted for infusion may be administered through an inline filter as long as the mean pore diameter of the filter is not smaller than 1  $\mu$ m.<sup>3068</sup>

## Ampicillin Sodium

AHFS 8:12.16.08

### Products

Ampicillin sodium is available in vials containing the equivalent of ampicillin 125 mg, 250 mg, 500 mg, 1 g, or 2 g as a powder.<sup>3291</sup>

For intramuscular injection, the vials should be reconstituted with sterile water for injection or bacteriostatic water for injection in the following amounts:<sup>3291</sup>

Vial Size	Volume of Diluent	Withdrawable Volume	Concentration
125 mg	1.2 mL	1 mL	125 mg/mL
250 mg	1 mL	1 mL	250 mg/mL
500 mg	1.8 mL	2 mL	250 mg/mL
1 g	3.5 mL	4 mL	250 mg/mL
2 g	6.8 mL	8 mL	250 mg/mL

For administration by direct intravenous injection, the 125-, 250-, and 500-mg vials should be reconstituted with 5 mL of sterile water for injection or bacteriostatic water for injection; the 1- or 2-g vials should be reconstituted with 7.4 or 14.8 mL, respectively, of sterile water for injection or bacteriostatic water for injection.<sup>3291</sup> For administration by intravenous infusion, the reconstituted solution as prepared for direct intravenous injection should be further diluted in a compatible infusion solution prior to administration.<sup>3291</sup>

Ampicillin sodium also is available in ADD-Vantage vials containing the equivalent of ampicillin 1 or 2 g as a powder.<sup>3292</sup> ADD-Vantage vials should be prepared with 50 or 100 mL of sodium chloride 0.9% or dextrose 5% in ADD-Vantage diluent bags.<sup>3292</sup>

Ampicillin sodium also is available in a pharmacy bulk package.<sup>3293</sup> The 10-g pharmacy bulk package should be reconstituted with 94 mL of sterile water for injection; the resulting solution contains ampicillin 100 mg/mL.<sup>3293</sup> The reconstituted pharmacy bulk package solution must be diluted further in a compatible infusion solution to achieve a solution with a final ampicillin concentration of 5 or 10 mg/mL.<sup>3293</sup>

### pH

The reconstituted solution of ampicillin has a pH ranging from 8 to 10.<sup>3293 3294</sup> The pH values of various ampicillin solutions are shown below:<sup>213</sup>

Ampicillin Concentration	Diluent	Initial pH
20 mg/mL	Sterile water	8.8
50 mg/mL	Sterile water	8.92
100 mg/mL	Sterile water	9.15
20 mg/mL	Sodium chloride 0.9%	8.7
50 mg/mL	Sodium chloride 0.9%	8.9

Ampicillin Concentration	Diluent	Initial pH
100 mg/mL	Sodium chloride 0.9%	9.2
20 mg/mL	Dextrose 5%	8.9
50 mg/mL	Dextrose 5%	9.3
100 mg/mL	Dextrose 5%	9.3

### Osmolality

Reconstituted with sterile water for injection, ampicillin (Wyeth) 100 mg/mL has an osmolality of 602 mOsm/kg.<sup>50</sup> At a concentration of 125 mg/mL, Wyeth's product was 702 mOsm/kg and Bristol's product was 675 mOsm/kg.<sup>1071</sup>

In another study, the osmolality of ampicillin sodium (Bristol) diluted in sodium chloride 0.9% was determined to be 493 mOsm/kg for ampicillin 50 mg/mL and 664 mOsm/kg for ampicillin 100 mg/mL.<sup>1375</sup>

The osmolality of ampicillin sodium 1 and 2 g was calculated for the following dilutions:<sup>1054</sup>

Diluent	Osmolality (mOsm/kg)	
	50 mL	100 mL
1 g		
Dextrose 5%	341	302
Sodium chloride 0.9%	368	328
2 g		
Dextrose 5%	418	346
Sodium chloride 0.9%	444	372

The following maximum ampicillin concentrations were recommended to achieve osmolalities suitable for peripheral infusion in fluid-restricted patients:<sup>1180</sup>

Diluent	Maximum Concentration (mg/mL)	Osmolality (mOsm/kg)
Dextrose 5%	62	583
Sodium chloride 0.9%	56	576
Sterile water for injection	112	588

### Sodium Content

Ampicillin sodium contains approximately 2.9 mEq of sodium per gram of drug.<sup>3291 3292 3293</sup>

### Administration

Ampicillin sodium is administered by intramuscular or direct intravenous injection<sup>3291</sup> or by intravenous infusion.<sup>3291 3292 3293</sup>

For direct intravenous injection, the reconstituted solutions of ampicillin prepared with 125-, 250-, and 500-mg vials should be administered slowly over 3 to 5 minutes; the reconstituted solutions of ampicillin prepared with 1- and 2-g vials should be administered slowly over at least 10 to 15 minutes.<sup>3291</sup> Solutions should not be administered more rapidly.<sup>3291</sup>

## Stability

Intact vials of ampicillin sodium should be stored at controlled room temperature.<sup>3291 3292 3293</sup>

Reconstituted ampicillin solutions should be protected from freezing.<sup>3291</sup>

Manufacturers recommended the use of only freshly prepared solutions.<sup>3291 3292 3293</sup> Reconstituted solutions of ampicillin for intramuscular or direct intravenous injection should be administered within 1 hour after preparation.<sup>3291</sup> Reconstituted solutions of ampicillin prepared from the pharmacy bulk package should be further diluted for intravenous infusion within 1 hour after preparation.<sup>3293</sup>

The stability of ampicillin in solution under various conditions has been the subject of much work and numerous articles. Several characteristics of the stability of ampicillin have emerged from these studies:

- The stability is concentration dependent and decreases as the concentration increases.
- Sodium chloride 0.9% appears to be a suitable diluent for the intravenous infusion of ampicillin.
- The stability is greatly decreased in dextrose solutions.
- Storage temperature and the pH of solution affect the stability.

## Storage and Usage Times

Savello and Shangraw offered the recommendations in Table 1 regarding storage conditions for ampicillin solutions.<sup>210</sup>

**Table 1. Suggested storage conditions for ampicillin solutions<sup>210</sup>**

Solution	Temperature (°C)	Maximum Storage
Reconstituted vial	-20	48 hr
	5	4 hr
	27	1 hr
Ampicillin 10 mg/mL in sodium chloride 0.9%	5	5 days
	27	24 hr
Ampicillin 10 mg/mL in dextrose 5%	5	4 hr
	27	2 hr

## Concentration Effects

The effect of concentration on ampicillin stability has been attributed to a self-catalyzing effect.<sup>210</sup> As the concentration increases, so does the rate of decomposition.<sup>170 210</sup> Savello and Shangraw reported that even though the initial pH values of various concentrations were 9.2 to 9.3, the higher concentrations of the drug maintained their pH longer because of their greater buffer capacity.<sup>210</sup> (See Table 2.)

**Table 2. Percent degradation of ampicillin solutions after reconstitution with water for injection at 5°C after 8 hours<sup>210</sup>**

Concentration	Percent Degradation
10 mg/mL	0.8
50 mg/mL	3.6
100 mg/mL	5.8
150 mg/mL	10.4
200 mg/mL	12.3
250 mg/mL	13.3

This concentration dependence of the stability of ampicillin has been related to the polymerization of penicillins in concentrated solutions.<sup>601 602</sup> Dimerization is the predominant form of degradation with high ampicillin concentrations. The extent of this effect declines as the concentration drops but still remains significant in a 20-mg/mL solution. At lower concentrations, hydrolysis becomes the determining factor.<sup>603</sup>

At a concentration of 500 mg/mL, ampicillin formed dimers, trimers, tetramers, and pentamers during 24 hours of storage at 24°C in the dark. The polymer formed through a chain process by linkage of the amino group on the side chain to another molecule with a cleaved  $\beta$ -lactam ring.<sup>1400</sup>

In a 200-mg/mL solution of ampicillin adjusted to pH 8.5 and stored at 22°C, 90% of all decomposition products formed within 72 hours were dimers and polymers. In a 50-mg/mL solution, 70% of the decomposition products were dimers and polymers. However, a 10-mg/mL solution formed  $\alpha$ -aminobenzylpenicilloic acid as the predominant decomposition product and a dimer concentration of 1 to 2%. The rate of dimerization was almost independent of pH in the range of 7 to 10, but increased strongly with increases in the initial ampicillin concentration.<sup>858</sup>

However, one study showed that if the pH of the solution was held constant at 8 or 9.15, there was little dependence of the rate of decomposition on concentration in the range of 20 to 100 mg/mL.<sup>213</sup>

## Infusion Diluents

Infusion diluents also affect the stability of ampicillin. Sodium chloride 0.9% appears to be a suitable diluent for the intravenous infusion of ampicillin sodium.

Dextrose is thought to exhibit an immense catalytic effect on the hydrolysis of ampicillin sodium,<sup>210</sup> decreasing the stability about one-half when compared to sterile water or sodium chloride 0.9%.<sup>213</sup> This has been well documented and has been regarded as an incompatibility.<sup>210 213</sup> (See Table 3.) This accelerated decomposition associated with dextrose extends to fructose as well, although it is not as extensive. It occurs in the alkaline pH range. Below pH 6 or 7, the decomposition rate with both dextrose and fructose appears to coincide with simple aqueous solutions.<sup>604</sup>

**Table 3. Percent degradation of ampicillin 10 mg/ml in dextrose 5% in water according to temperature and time<sup>210</sup>**

Temperature (°C)	4 hr	8 hr	24 hr
-20	13.6	22.3	45.6
0	6.2	11.6	26.3
5	10.1	15.2	29.7
27	21.3	31.1	46.5

Savello and Shangraw further showed that increasing the concentration of dextrose decreased the stability of ampicillin. (See Table 4.)

**Table 4. Percent degradation of ampicillin 10 mg/ml at 5°C according to dextrose concentration and time<sup>210</sup>**

Percent Dextrose	3 hr	7 hr
5	7.4	13.9
10	10.3	19.4
20	14.2	27.8

### pH Effects

The pH of the solution also plays a role in its stability. Hydrolysis has been shown to be catalyzed by hydroxide ions. An increase of 1 pH unit in an ampicillin solution has been shown to increase the rate of decomposition 10-fold.<sup>213</sup>

The optimum pH for ampicillin stability has been variously reported as 5.8,<sup>1072</sup> 5.85 at 35°C,<sup>215</sup> approximately 5.2 at 25°C,<sup>604</sup> and 7.5 at room temperature.<sup>209</sup> The pH of ampicillin solutions, however, is in the alkaline range, with higher pH values having been reported at higher concentrations.<sup>213</sup> (See pH under Products.)

Ampicillin (Bristol) 10 g/L was tested for stability at pH 3.4 to 9.2 in various buffer additives. A 7.6% potency loss was reported in 12 hours at room temperature at pH 7.5. Significantly higher degradation rates occurred as the pH varied from 7.5, with about 70% degradation occurring in 12 hours at room temperature at pH 3.4 and 9.2.<sup>209</sup>

In another evaluation, rate constants for ampicillin degradation at various pH values were calculated for an aqueous solution at 25°C. The pH providing maximum stability was 5.2. When tested in dextrose 10%, a minimum rate of decomposition was observed at approximately pH 5 to 5.5. The amount of ampicillin degradation was 10% or less in 24 hours at 25°C within a pH range of about 2.75 to 6.75. At pH 8, the time to 10% decomposition was only about 2 hours.<sup>604</sup>

The stability of ampicillin (Beecham) 250 mg/50 mL and 1 g/100 mL in sodium chloride 0.9% in polyvinyl chloride (PVC) bags was compared with the stability of the same solutions buffered with potassium acid phosphate 13.6% injection. The 50- and 100-mL containers were buffered with 1 and 2 mL,

respectively, lowering the pH by nearly 2 pH units. Larger quantities of buffer caused precipitation. When stored at 5°C, the 250-mg/50 mL solution had a shelf life ( $t_{90}$ ) of 12 days while the 1-g/100-mL solution had a shelf life of 6 days. This finding compares favorably to the shelf life of 1 to 2 days for the unbuffered solutions.<sup>1820</sup>

The stability of ampicillin 12 g/L prepared from ampicillin (AAP) 2 g/16 mL and ampicillin (Auromedics) 10 g/100 mL in sodium chloride 0.9% in 1-L bags was compared with the stability of the same solution buffered with sodium phosphate injection (American Regent) 10 mmol.<sup>3418</sup> Addition of the buffer lowered the average initial pH from 9.25 to 8.15.<sup>3418</sup> At a room temperature of 25°C, the buffered solution was stable for at least 48 hours (calculated time to 10% loss of 57.6 hours) as compared with at least 24 hours (calculated time to 10% loss ranging from 32 to 41.7 hours) for the unbuffered solution.<sup>3418</sup> The buffered solution also was stable for up to 48 hours at 2 to 8°C followed by up to 24 hours at a room temperature of 25°C.<sup>3418</sup>

### Temperature Effects

The storage temperature of ampicillin solutions also may affect stability. It has been stated that freezing ampicillin solutions at -20°C increases the rate of decomposition over that at 5°C. For this reason, it has been recommended that ampicillin solutions not be stored in the frozen state.<sup>123 213</sup>

Apparent increased ampicillin decomposition was found at -20°C over that at 5°C in 2 of the 10-mg/mL solutions tested (Tables 3 and 5). In a study of ampicillin 20 mg/mL, about 4 to 6% greater loss was found at -20°C than at 5°C in 24 hours in both dextrose 5% and sodium chloride 0.9%.<sup>208</sup>

**Table 5. Percent degradation of ampicillin 10 mg/ml in water according to temperature and time<sup>210</sup>**

Temperature (°C)	4 hr	8 hr	24 hr
-20	1.3	1.9	5.2
5	0.4	0.8	2.0

An explanation of this phenomenon was proposed by Pincock and Kiovsy. Below the freezing point but above the eutectic temperature, there exists a liquid and solid phase in equilibrium. If it is assumed that -20°C is above the eutectic temperature, then liquid regions of a saturated solution of ampicillin exist, which result in increased decomposition.<sup>214</sup> Solutions of ampicillin stored at -78°C showed no decomposition within 24 hours.<sup>210</sup>

In a study of long-term storage, ampicillin (Ayerst) 1 g/50 mL in dextrose 5% and also sodium chloride 0.9% was tested in PVC containers frozen at -20°C for 30 days. In sodium chloride 0.9%, they reported approximately 10% decomposition in 1 day and approximately 70% decomposition in 30 days. In dextrose 5%, even greater decomposition occurred. They reported about 50% decomposition in 1 day and virtually total decomposition in 30 days.<sup>299</sup>

Ampicillin (Wyeth) 1 g/50 mL of dextrose 5% was tested in PVC bags frozen at -20°C for 30 days and then thawed by

exposure to ambient temperature or microwave radiation. The admixtures showed essentially total loss of ampicillin activity determined microbiologically.<sup>554</sup> At  $-30^{\circ}\text{C}$ , only 18% of the ampicillin remained in 30 days. A storage temperature of  $-70^{\circ}\text{C}$  was required to retain at least 90% of the original activity for 30 days.<sup>555</sup>

The same concentration in sodium chloride 0.9% showed a 29% loss of ampicillin activity at  $-20^{\circ}\text{C}$  but only about a 4% loss at  $-30$  and  $-70^{\circ}\text{C}$  after 30 days. Subsequent thawing of the  $-30$  and  $-70^{\circ}\text{C}$  samples by exposure to microwave radiation and storage at room temperature for 8 hours resulted in additional losses of activity, with the final concentration totaling about 90% of the initial amount. The authors concluded that ampicillin in sodium chloride 0.9% could be stored for 30 days at  $-30^{\circ}\text{C}$ , which was presumably below the eutectic point for this admixture. However,  $-30^{\circ}\text{C}$  was believed to be above the eutectic point for the dextrose 5% admixture because decomposition continued to occur.<sup>555</sup>

Even within acceptable limits for room temperature, significant differences in the rate of ampicillin decomposition can occur. In one solution at  $20^{\circ}\text{C}$ , a 10% ampicillin loss resulted in 44 hours. This same solution at  $30^{\circ}\text{C}$  exhibited a 10% loss in 12 hours. Over the range of 20 to  $35^{\circ}\text{C}$ , each  $5^{\circ}\text{C}$  rise approximately doubled the rate of decomposition.<sup>604</sup>

### Sorption

Ampicillin was shown not to exhibit sorption to PVC bags and tubing, polyethylene tubing, Silastic tubing, polypropylene syringes, and trilayer solution bags composed of polyethylene, polyamide, and polypropylene.<sup>536 606 1035 1918</sup>

### Filtration

Filtration of ampicillin sodium (Wyeth) is stated to result in no adsorption, yielding solutions that maintain their potency.<sup>829</sup>

Ampicillin (Bristol) 1.97 mg/mL in sodium chloride 0.9% was filtered through a  $0.22\text{-}\mu\text{m}$  cellulose ester membrane filter (Ivex-HP, Millipore) over 5 hours. No significant drug loss due to binding to the filter was noted.<sup>1034</sup>

### Central Venous Catheter

Ampicillin (Apothecon) 5 mg/mL in sodium chloride 0.9% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

<sup>a</sup> Tested in dextrose 5%.

<sup>b</sup> Tested in sodium chloride 0.9%.

<sup>c</sup> Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>d</sup> Tested in dextrose 5%, sodium chloride 0.9%, and Ringer's injection, lactated.

<sup>e</sup> Lyophilized formulation tested.

<sup>f</sup> Refer to Appendix for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>g</sup> A 32.5-mL sample of parenteral nutrition solution mixed with 50 mL of antibiotic solution.

<sup>h</sup> Run at 21 mL/hr.

<sup>i</sup> Given over five minutes by syringe pump.

<sup>j</sup> Run at 94 mL/hr.

<sup>k</sup> Tested in sterile water for injection.

<sup>l</sup> Test performed using the formulation WITHOUT edetate disodium.

<sup>m</sup> Tested in either dextrose 5% or in sodium chloride 0.9%, but the report did not specify which solution.

<sup>n</sup> Tested in a 1:1 mixture of (1) dextrose 5% and dextrose 5% in sodium chloride 0.45% with and without potassium chloride 20 mEq/L and also in (2) dextrose 10% in sodium chloride 0.45% with and without potassium chloride 20 mEq/L.

<sup>o</sup> Tested in combination with hydrocortisone sodium succinate (Upjohn) 100 mg/L

<sup>p</sup> Tested in combination with heparin sodium (Rikers) 1000 units/L

<sup>q</sup> Test performed using the formulation WITH edetate disodium.

## Additional Compatibility Information

### *Peritoneal Dialysis Solutions*

The stability of ampicillin (Bristol) 50 mg/L in peritoneal dialysis solutions (Dianeal 137 and PD-2) with heparin sodium 500 units/L was evaluated at 25°C. Approximately 93 ± 10% activity remained after 24 hours.<sup>1228</sup> However, ampicillin (Bristol) 2.5 g/L in peritoneal dialysis concentrate (Travenol) containing dextrose 30% with and without heparin sodium 2500 units/L

underwent substantial reduction in activity within as little as 10 minutes.<sup>273</sup>

The stability of ampicillin (Aspen Pharmacare) 125 mg/L in pH-neutral Balance (Fresenius), icodextrin-based Extraneal (Baxter), and dextrose-based Dianeal PD-4 (Baxter) peritoneal dialysis solutions was evaluated.<sup>2984</sup> At 4, 25, and 37°C, ampicillin was stable in Balance for 336, 12, and 12 hours, respectively; in Extraneal for 336, 48, and 24 hours, respectively; and in Dianeal PD-4 for 336, 72, and 24 hours, respectively.<sup>2984</sup>

## Ampicillin Sodium–Sulbactam Sodium

AHFS 8:12.16.08

### Products

Ampicillin sodium–sulbactam sodium is available in vials and piggyback bottles containing 1.5 g (ampicillin 1 g plus sulbactam 0.5 g) or 3 g (ampicillin 2 g plus sulbactam 1 g) as the sodium salts.<sup>1(6/06)</sup>

For intramuscular injection, reconstitute vials with sterile water for injection or lidocaine hydrochloride 0.5 or 2% in the following amounts:<sup>1(6/06)</sup>

Vial Size	Volume of Diluent	Withdrawable Volume	Concentration
1.5 g	3.2 mL	4 mL <sup>a</sup>	375 mg/mL <sup>b</sup>
3 g	6.4 mL	8 mL <sup>a</sup>	375 mg/mL <sup>b</sup>

<sup>a</sup> Sufficient excess is present to permit withdrawal of the volume noted.

<sup>b</sup> Ampicillin 250 mg plus sulbactam 125 mg per mL.

For intravenous use, reconstitute piggyback bottles directly with a compatible diluent to the desired concentration between 3 and 45 mg/mL (ampicillin 2 to 30 mg plus sulbactam 1 to 15 mg per mL). Standard vials of 1.5 and 3 g may be reconstituted with 3.2 and 6.4 mL of sterile water for injection, respectively, to yield 375-mg/mL solutions (ampicillin 250 mg plus sulbactam 125 mg per mL). The reconstituted solution should be diluted immediately in a compatible infusion solution to yield the desired concentration between 3 and 45 mg/mL.<sup>1(6/06)</sup>

Allow reconstituted solutions to stand so that any foaming may dissipate before inspecting them visually to ensure complete dissolution.<sup>1(6/06)</sup>

### pH

From 8 to 10.<sup>1(6/06)</sup>

## Compatibility Information

### Solution Compatibility

#### Ampicillin sodium–sulbactam sodium

Test Soln Name	Mfr	Mfr	Conc/L or %	Remarks	Ref	C/I
Dextrose 5% in sodium chloride 0.45%			20 <sup>b</sup> , 10 <sup>b</sup> g	Stable for only 4 hr at 4 and 25°C	1(6/06)	I
Dextrose 5%			2 <sup>b</sup> g	Stable for only 4 hr at 25°C	1(6/06)	I
Dextrose 5%			20 <sup>b</sup> g	Stable for only 4 hr at 4°C and 2 hr at 25°C	1(6/06)	I
Ringer's injection, lactated			30 <sup>b</sup> g	Stable for 24 hr at 4°C but only 8 hr at 25°C	1(6/06)	I
Sodium chloride 0.9%			30 <sup>b</sup> g	Stable for 48 hr at 4°C and 8 hr at 25°C	1(6/06)	C

### Sodium Content

Each 1.5 g (ampicillin 1 g plus sulbactam 0.5 g as the sodium salts) contains 5 mEq (115 mg) of sodium.<sup>1(6/06)</sup>

### Trade Name(s)

Unasyn

### Administration

Ampicillin sodium–sulbactam sodium may be administered by deep intramuscular injection or intravenous injection or infusion.<sup>3285</sup> For direct intravenous injection, the drug should be given slowly over at least 10 to 15 minutes.<sup>3285</sup> For intravenous infusion, the drug may be diluted in 50 to 100 mL of compatible diluent and infused over 15 to 30 minutes.<sup>3285</sup>

### Stability

Intact vials of the white to off-white powder should be stored at or below 30°C.<sup>3285</sup> Aqueous solutions are pale yellow to yellow.<sup>3285</sup> Dilute solutions are colorless to pale yellow.<sup>3285</sup> The manufacturer recommends that intramuscular solutions be used within 1 hour after preparation.<sup>3285</sup>

### Central Venous Catheter

Ampicillin sodium–sulbactam sodium (Pfizer-Roerig) 5 plus 2.5 mg/mL in sodium chloride 0.9% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

## Amsacrine

### AHFS 10:00

### Products

Amsacrine is available in ampuls containing 1.5 mL of a 50-mg/mL solution (75 mg total) in anhydrous *N,N*-dimethylacetamide (DMA). It is packaged with a vial containing 13.5 mL of 0.0353 M L-lactic acid diluent.<sup>1</sup>

To prepare the drug for use, aseptically add 1.5 mL of the amsacrine solution to the vial of L-lactic acid diluent. The resulting orange-red solution contains amsacrine 5 mg/mL in 10% (v/v) *N,N*-dimethylacetamide and 0.0318 M L-lactic acid. This concentrated solution must be diluted in dextrose 5% for infusion; do not use chloride-containing solutions.<sup>1</sup>

Direct contact of amsacrine solutions with skin or mucous membranes may result in skin sensitization and should be avoided.<sup>234</sup>

### Trade Name(s)

Amsidine, Amsidyl

### Administration

Amsacrine is administered by central vein infusion over 60 to 90 minutes after the dose is diluted in 500 mL of dextrose 5%.<sup>1</sup>

### Stability

Amsacrine in intact ampuls should be stored at room temperature.<sup>1</sup> When mixed with the L-lactic acid diluent, the amsacrine solution is physically and chemically stable for at least 48 hours at room temperature under ambient light.<sup>234</sup>

### Light Effects

The effect of diffuse daylight and fluorescent light on amsacrine 150 mcg/mL in dextrose 5% was studied for 48 hours at 19 to 21°C; no loss due to light exposure occurred.<sup>1308</sup>

### Syringes

Glass syringes are recommended for the transfer of amsacrine concentrate to the L-lactic acid diluent.<sup>115</sup> The DMA solvent may extract UV-absorbing species from plastics and rubber.<sup>967</sup>

The compatibility of amsacrine (Gödecke) concentrated solution in DMA with rubber-free plastic syringes (Injekt, B. Braun) was evaluated at 37°C and ambient temperature. Storage of the DMA diluent in the plastic syringes resulted in no visible changes to the drug or syringes and did not adversely affect the performance of the syringes. Analysis found a trace amount of oleic acid amide lubricant, about 50 mcg in the 2-mL syringe content, after storage for 24 hours at 37°C. Storage at ambient temperature resulted in substantially lower amounts of oleic acid amide. The authors concluded the rubber-free Injekt plastic syringes were acceptable alternatives to glass syringes to transfer the amsacrine concentrate. Other plastic syringes incorporating rubber components are not recommended because of the extraction of materials into the drug solution.<sup>2284</sup>

### Sorption

Amsacrine 150 mcg/mL in dextrose 5% did not undergo sorption to cellulose propionate and methacrylate butadiene styrene burette chambers and PVC and polybutadiene tubing.<sup>1308</sup>

## Anakinra

AHFS 92:36

### Products

Anakinra is available in prefilled glass syringes containing 100 mg of drug in 0.67 mL of solution.<sup>2859</sup> The prefilled syringes have 27-gauge needles protected with latex rubber covers.<sup>2859</sup> Each syringe containing 0.67 mL of solution also contains anhydrous citric acid 1.29 mg, sodium chloride 5.48 mg, disodium EDTA 0.12 mg, and 0.7 mg of polysorbate 80 in water for injection.<sup>2859</sup>

### pH

6.5.<sup>2859</sup>

### Trade Name(s)

Kineret

### Administration

Anakinra is administered subcutaneously.<sup>2859</sup>

### Stability

Anakinra should be stored under refrigeration.<sup>2859</sup> Do not shake; protect from freezing and light. The injection contains no preservative and is for single use.<sup>2859</sup> Discard any unused portions.<sup>2859</sup>

Visually inspect the syringes prior to use.<sup>2859</sup> The solution may contain trace amounts of small, translucent to white, amorphous protein particles.<sup>2859</sup> If the number of these particles appears excessive or the solution is discolored, cloudy, or particulate matter is present, the syringe should be discarded.<sup>2859</sup>

## Angiotensin II Acetate

AHFS 68:44

### Products

Angiotensin II acetate concentrate for injection is available as a solution in 1-mL single-dose vials with each mL containing the equivalent of 2.5 mg angiotensin II.<sup>3397</sup> Each mL of solution also contains mannitol 25 mg and sodium hydroxide and/or hydrochloric acid for pH adjustment in water for injection.<sup>3397</sup>

Angiotensin II acetate concentrate for injection must be diluted in sodium chloride 0.9% prior to administration.<sup>3397</sup> For fluid-restricted patients, 1 mL (2.5 mg) or 2 mL (5 mg) of the concentrate for injection should be diluted in a 250- or 500-mL infusion bag, respectively, of sodium chloride 0.9% for a resulting concentration of 10,000 ng/mL.<sup>3397</sup> For patients who are not fluid restricted, 1 mL (2.5 mg) of the concentrate for injection should be diluted in a 500-mL infusion bag of sodium chloride 0.9% for a resulting concentration of 5000 ng/mL.<sup>3397</sup>

### pH

Adjusted to 5.5.<sup>3397</sup>

### Osmolality

When diluted as directed in sodium chloride 0.9%, the diluted solution of angiotensin II will assume the same osmolality as the sodium chloride 0.9% solution.<sup>3430</sup>

### Equivalency

Angiotensin II 2.5 mg is equivalent to an average of 2.9 mg of angiotensin II acetate.<sup>3397</sup>

### Trade Name(s)

Giapreza

## Compatibility Information

### Solution Compatibility

#### Angiotensin II acetate

Test Soln Name	Mfr	Mfr	Conc/L or %	Remarks	Ref	C/I
Sodium chloride 0.9%		LJ	5000 and 10,000 mcg	Discard after 24 hr at room temperature or under refrigeration	3397	C

### Y-Site Injection Compatibility (1:1 Mixture)

#### Angiotensin II acetate

Test Drug	Mfr	Conc	Mfr	Conc	Remarks	Ref	C/I
Dopamine HCl			LJ	5 and 10 mcg/mL <sup>a</sup>	Stated to be compatible	3430	C
Epinephrine <sup>b</sup>			LJ	5 and 10 mcg/mL <sup>a</sup>	Stated to be compatible	3430	C
Norepinephrine bitartrate			LJ	5 and 10 mcg/mL <sup>a</sup>	Stated to be compatible	3430	C

### Administration

Angiotensin II acetate is administered as a continuous intravenous infusion following dilution in sodium chloride 0.9%.<sup>3397</sup> The manufacturer recommends administration of the infusion through a central venous line,<sup>3397</sup> preferably through a dedicated port.<sup>3430</sup>

Infusion of the diluted angiotensin II solution should be initiated at a rate of 20 ng/kg/min with an upward titration as frequently as every 5 minutes by increments of up to 15 ng/kg/min as needed to achieve or maintain target blood pressure.<sup>3397</sup> The infusion rate should not exceed 80 ng/kg/min during the first 3 hours of treatment; the maintenance infusion rate should not exceed 40 ng/kg/min.<sup>3397</sup>

### Stability

Angiotensin II acetate concentrate for injection is a clear solution.<sup>3397</sup> Intact vials of the concentrate for injection should be stored under refrigeration at 2 to 8°C.<sup>3397</sup> Angiotensin II acetate solutions should be visually inspected for particulate matter and discoloration prior to administration.<sup>3397</sup>

Diluted solutions of angiotensin II for infusion may be stored at room temperature or under refrigeration for up to 24 hours; after this period, the diluted solutions should be discarded.<sup>3397</sup>

### Sorption

Both polyvinyl chloride (PVC) and non-PVC infusion bags containing sodium chloride 0.9% may be used in the preparation of angiotensin II for infusion.<sup>3430</sup> Adherence of the peptide to the infusion bag has not been observed in compatibility studies.<sup>3430</sup>

## Anidulafungin

AHFS 8:14.16

### Products

Anidulafungin is available in 50-mg vials with 50 mg of fructose, 250 mg of mannitol, 125 mg of polysorbate 80, 5.6 mg of tartaric acid, and sodium hydroxide and/or hydrochloric acid to adjust pH.<sup>2862</sup> Anidulafungin also is available in 100-mg vials with 100 mg of fructose, 500 mg of mannitol, 250 mg of polysorbate 80, 11.2 mg of tartaric acid, and sodium hydroxide and/or hydrochloric acid to adjust pH.<sup>2862</sup>

Reconstitute the 50- and 100-mg vials with 15 and 30 mL, respectively, of sterile water for injection to yield a concentrated solution containing anidulafungin 3.33 mg/mL.<sup>2862</sup> This concentrate must be diluted in dextrose 5% or sodium chloride 0.9% for administration.<sup>2862</sup> The manufacturer recommends diluting 50-, 100-, and 200-mg quantities of anidulafungin in 50, 100, and 200 mL, respectively.<sup>2862</sup>

### Trade Name(s)

Eraxis

### Administration

Anidulafungin is administered by intravenous infusion at a rate not exceeding 1.1 mg/min after dilution in dextrose 5% or sodium chloride 0.9%.<sup>2862</sup> No other solution should be used.<sup>2862</sup>

### Stability

Intact vials of anidulafungin should be stored refrigerated and protected from freezing.<sup>2862</sup>

The reconstituted anidulafungin solution is stable at controlled room temperature for up to 24 hours prior to dilution.<sup>2862</sup> Anidulafungin diluted in dextrose 5% or sodium chloride 0.9% for infusion is stable at controlled room temperature for up to 48 hours or frozen for up to 72 hours from preparation.<sup>2862</sup>

## Antihemophilic Factor (Recombinant)

AHFS 20:28.16

### Products

Antihemophilic factor (recombinant) is available in forms prepared by differing processes. Helixate FS, Kogenate, and Kogenate FS are prepared using human factor VIII genes in baby hamster kidney cells while Advate, Recombinate, and ReFacto are prepared from human factor VIII genes in Chinese hamster ovary cells. The products are available in sizes of 250, 500, 1000, 2000, and 3000 international units with sterile water for injection diluent. The vials of drug are sealed under vacuum.<sup>1(12/08) 4</sup>

After reconstitution, Kogenate contains excipients of glycine 10 to 30 mg/mL, up to 500 mcg/1000 international units of imidazole, up to 600 mcg/1000 international units of polysorbate 80, calcium chloride 2 to 5 mM, human albumin 1 to 4 mg/mL, and sodium chloride.<sup>1(12/08)</sup>

Helixate FS and Kogenate FS are formulated with sucrose. After reconstitution, the products contain excipients of sucrose 0.9 to 1.3%, L-histidine 18 to 23 mM, glycine 21 to 25 mg/mL, calcium chloride 2 to 3 mM, up to 35 mcg/mL of polysorbate 80, up to 20 mcg/1000 international units of imidazole, up to 5 mcg/1000 international units of tri-n-butyl phosphate.<sup>1(12/08)</sup>

After reconstitution, Recombinate contains excipients of human albumin 12.5 mg/mL, calcium 0.2 mg/mL, polyethylene glycol 3350 1.5 mg/mL, histidine 55 mM, polysorbate 80 1.5 mcg/international unit, and sodium 0.18 mEq/mL.<sup>1(12/08)</sup>

Reconstituted ReFacto contains excipients of sodium chloride, sucrose, L-histidine, calcium chloride, and polysorbate 80.<sup>1(12/08)</sup>

To reconstitute, allow the vials to come to room temperature, and use the transfer needle provided or syringe and needle to transfer the diluent into the vial of drug. The vacuum will draw in the diluent. Direct the stream against the vial wall and avoid excessive foaming. Incomplete diluent transfer warrants discarding the vial. Remove the transfer needle and swirl the vial with gentle agitation to dissolve the powder. It should not be vigorously shaken. Do not refrigerate after reconstitution.<sup>1(12/08)</sup>

### Trade Name(s)

Advate, Helixate FS, Kogenate, Kogenate FS, ReFacto

Selected Revisions June 1, 2019. © Copyright, October 2004. American Society of Health-System Pharmacists, Inc.

### Administration

Antihemophilic factor (recombinant) is administered intravenously. The drug should be withdrawn from the vial into a syringe using the sterile filter needle provided. The use of plastic syringes has been suggested because proteins tend to adhere more to glass syringes than to plastic ones.<sup>1(12/08)</sup>

### Stability

The products should be stored under refrigeration protected from light; freezing should be avoided because of possible damage to the diluent container. Intact vials of drug may be stored up to 3 months at room temperature up to 25°C (Kogenate, ReFacto) or 30°C (Recombine). The products do not contain an antimicrobial preservative; use within 3 hours after reconstitution is recommended.<sup>1(12/08) 4</sup>

Antihemophilic factor VIII (ADVATE, Baxter) when reconstituted as directed was found to exhibit about 8% loss of activity within 24 hours when stored at controlled room temperature.<sup>2748</sup>

### Sorption

Antihemophilic factor (recombinant) (Bayer) 1 international unit/mL in sodium chloride 0.9% was delivered at a rate of 1 mL/min through administration tubing composed of polyvinyl chloride (PVC) (Terumo) and polybutadiene (Terumo). No loss of antihemophilic factor (recombinant) occurred with the polybutadiene administration tubing. However, losses of 10 to 16% occurred through the PVC sets.<sup>2448</sup>

### Filtration

Antihemophilic factor (recombinant) (Bayer) 1 international unit/mL in sodium chloride 0.9% was delivered at a rate of 1 mL/min through administration tubing composed of PVC with 0.2- $\mu$ m inline filters composed of degenerated polysulfone (Terumo), polyethersulfone (JMS), and degenerated polyethersulfone (Nipro). No added loss of antihemophilic factor (recombinant) due to sorption to the filter occurred with the polysulfone filter. However, only 50 to 60% of the antihemophilic factor (recombinant) was delivered with the polyethersulfone filters. About 15% of the loss was attributable to the PVC tubing (see Sorption), but the balance resulted from the filters.<sup>2448</sup>

## Antithymocyte Globulin (Rabbit)

AHFS 92:44

### Products

Antithymocyte globulin (rabbit) is available as a lyophilized powder in 25-mg vials with glycine 50 mg, mannitol 50 mg, and sodium chloride 10 mg. The vial of drug is accompanied by a 5-mL vial of sterile water for injection for use as a diluent.<sup>1(9/07)</sup>

Allow the vials of antithymocyte globulin (rabbit) and diluent to warm to room temperature before reconstitution. Reconstitute the vial of drug with the diluent provided immediately before use. Direct the flow of diluent to the side of the vial. Rotate the vial gently to dissolve the drug, resulting in a 5-mg/mL solution. Inspect for particulate matter before use; the solution should be clear and not opaque. Should some particulate matter remain, continue rotating gently until all particulate matter is dissolved.<sup>1(9/07)</sup>

### pH

From 6.6 to 7.4.<sup>1(9/07)</sup>

### Trade Name(s)

Thymoglobulin

### Administration

Antithymocyte globulin (rabbit) is administered intravenously into a high-flow vein after dilution in dextrose 5% or sodium

chloride 0.9% to an approximate concentration of 0.5 mg/mL. The manufacturer recommends that each vial to be administered be diluted in 50 mL of infusion solution. The total volume usually ranges between 50 and 500 mL. Invert the bag gently once or twice to mix the solution before administration.<sup>1(9/07)</sup>

Antithymocyte globulin (rabbit) diluted for administration is infused through a 0.22- $\mu$ m filter over a minimum of six hours for the first infusion and over at least four hours subsequently.

### Stability

Intact vials of antithymocyte globulin (rabbit) should be stored under refrigeration and protected from light and freezing. After reconstitution, the drug is stable for 24 hours but should be used within four hours because of the absence of preservatives.<sup>1(9/07)</sup> Mixed in an infusion solution, immediate use is recommended.<sup>1(9/07)</sup>

Antithymocyte globulin (rabbit) is for single use and contains no preservative. Any unused drug remaining should be discarded.<sup>1(9/07)</sup>

### Sorption

The manufacturer states that no interaction of antithymocyte globulin (rabbit) with glass bottles or PVC bags or administration sets has been found.<sup>4</sup>

## Apomorphine Hydrochloride

AHFS 28:36.20.08

### Products

Apomorphine hydrochloride is available as 10-mg/mL injections with sodium metabisulfite 1 mg in 1-, 2-, and 5-mL ampuls and may also contain sodium hydroxide and/or hydrochloric acid to adjust pH during manufacturing.<sup>38 115</sup>

### pH

From 3 to 4.<sup>115</sup>

### Trade Name(s)

APO-go, Apokinon, Apomine

### Administration

Apomorphine hydrochloride is administered subcutaneously by intermittent injection or continuous infusion using a controlled infusion device.<sup>38 115</sup>

### Stability

Containers should be stored under refrigeration<sup>115</sup> or at controlled room temperature<sup>38</sup> and protected from freezing and exposure to light.<sup>38 115</sup> Apomorphine hydrochloride injection should be clear and colorless and should not be used if it has turned green.<sup>38</sup>

### Light Effects

Apomorphine hydrochloride is very sensitive to exposure to light. In sodium chloride 0.9%, apomorphine hydrochloride (Teclapharm) 0.01 mg/mL and 0.1 mg/mL lost 44 and 24%, respectively, in one day when stored at room temperature without light protection.<sup>2403</sup>

## Aprepitant

AHFS 56:22.32

### Products

Aprepitant is available as an oil-in-water emulsion in single-dose vials containing 130 mg of aprepitant in 18 mL of emulsion.<sup>3436 3437</sup> Also present in each 130-mg vial are egg lecithin 2.6 g, ethanol 0.5 g, sodium oleate 0.1 g, soybean oil 1.7 g, sucrose 1 g, and water for injection.<sup>3436</sup>

To prepare a 130-mg infusion, 18 mL of the emulsion should be withdrawn from the vial and transferred to a non-polyvinyl chloride (non-PVC) infusion bag containing 130 mL of sodium chloride 0.9% or dextrose 5%.<sup>3436</sup> To prepare a 100-mg infusion, 14 mL of the emulsion should be withdrawn from the vial and transferred to a non-PVC infusion bag containing 100 mL of sodium chloride 0.9% or dextrose 5%.<sup>3436</sup> After addition of the emulsion to the infusion bag, the bag should be inverted gently 4 to 5 times; shaking should be avoided.<sup>3436</sup> Infusion bags should be inspected for particulate matter and discoloration; if particulate matter is present or discoloration has occurred, the infusion bag should be discarded.<sup>3436</sup>

© Copyright, June 2019. American Society of Health-System Pharmacists, Inc.

### Administration

Aprepitant is administered by intravenous infusion over 30 minutes.<sup>3436</sup> Aprepitant should be administered using only non-diethylhexyl phthalate (non-DEHP) tubing after dilution of the emulsion in a non-PVC infusion bag containing the appropriate volume of sodium chloride 0.9% or dextrose 5%.<sup>3436</sup>

### Stability

Aprepitant is an opaque, off-white to amber oil-in-water emulsion.<sup>3436 3437</sup> Intact vials should be stored at 2 to 8°C and should not be frozen.<sup>3436</sup> Intact vials can be stored at room temperature for up to 60 days.<sup>3436</sup> The manufacturer states that the emulsion when diluted as recommended is stable for 6 hours at ambient room temperature in sodium chloride 0.9% or 12 hours at ambient room temperature in dextrose 5%.<sup>3436</sup>

Aprepitant is incompatible with any solutions containing divalent cations (e.g., calcium, magnesium), including Ringer's injection, lactated and Hartmann's solution.<sup>3436</sup>

### Sorption

The diluted emulsion should be prepared using only non-PVC infusion bags and administered using only non-DEHP tubing.<sup>3436</sup>

## Argatroban

AHFS 20:12.04.12

### Products

Argatroban concentrate for injection is available in 2.5-mL single-use vials containing 250 mg of the drug.<sup>3186</sup> Several different formulations of the concentrate for injection are available and excipients vary among them.<sup>3186 3190 3191</sup> Each mL of the concentrate for injection (GlaxoSmithKline) also contains D-sorbitol 300 mg and dehydrated alcohol 400 mg in water for injection.<sup>3186</sup> Each mL of the concentrate for injection (Fresenius Kabi) also contains propylene glycol 954 mg.<sup>3190</sup> Each mL of the concentrate for injection (West-Ward) also contains propylene glycol 1300 mg and dehydrated alcohol 760 mg.<sup>3191</sup> The concentrate for injection must be diluted 100-fold in sodium chloride 0.9%, dextrose 5%, or Ringer's injection, lactated to yield a final concentration of 1 mg/mL.<sup>3186</sup> The solution should be mixed thoroughly after dilution by repeated inversion of the infusion bag for 1 minute.<sup>3186</sup> Slight haziness may form due to transient microprecipitation, however, the microprecipitates should dissolve rapidly with mixing.<sup>3186</sup> Use of room temperature diluent is recommended for dilution as colder temperatures can slow down the dissolution rate of precipitates.<sup>3186</sup> The diluted solution for infusion must be clear for administration.<sup>3186</sup>

Argatroban also is available as a ready-to-use solution of 1 mg/mL of argatroban in 50- and 125-mL single-use vials and 250-mL single-use polyolefin bags.<sup>3187 3188 3189</sup> Each mL of solution in the 50-mL (50-mg) vial also contains lactobionic acid 2 mg, L-methionine 2 mg, sodium chloride 8 mg, and sodium hydroxide to adjust the pH in water for injection.<sup>3187</sup> Each mL of solution in the 125-mL (125-mg) vial and 250-mL (250-mg) bag also contains sodium chloride 9 mg and sorbitol 3 mg in water for injection.<sup>3188 3189</sup> The ready-to-use solution should not be diluted prior to administration.<sup>3187 3188 3189</sup>

### pH

The pH of the concentrate for injection diluted to a concentration of 1 mg/mL for infusion and the 1-mg/mL ready-to-use solution in 125-mL vials and 250-mL bags ranges from 3.2 to 7.5.<sup>3186 3188 3189</sup> The pH of the 1-mg/mL ready-to-use solution in 50-mL vials is approximately 8.8.<sup>3187</sup>

### Tonicity

The 1-mg/mL ready-to-use solution of argatroban in 125-mL vials and 250-mL bags is isotonic.<sup>3188 3189</sup>

## Compatibility Information

### Solution Compatibility

#### Argatroban

Test Soln Name	Mfr	Mfr	Conc/L or %	Remarks	Ref	C/I
Dextrose 5%		GSK, WW	1 g	Stable for 24 hr at 20 to 25°C in normal room light	3186, 3191	C
Dextrose 5%		GSK, WW	1 g	Physically compatible and chemically stable for 96 hr at 20 to 25°C or 5°C protected from light	3186, 3191	C

### Administration

Argatroban solutions of 1 mg/mL are administered by continuous intravenous infusion.<sup>3186 3187 3188 3189</sup> For certain indications, an initial bolus injection of the 1-mg/mL solution should be administered over 3 to 5 minutes through a large bore intravenous line; subsequent additional bolus injections of the 1-mg/mL solution may be warranted for dosage adjustment.<sup>3186 3187 3188 3189</sup> Specific labeling should be consulted for further dosage and administration details.

Vials of the ready-to-use solution of argatroban may be inverted and connected to an infusion set for administration.<sup>3187 3188</sup>

### Stability

Argatroban concentrate for injection and ready-to-use solutions are clear and colorless to pale yellow in appearance.<sup>3186 3187 3188 3189</sup> The concentrate for injection is slightly viscous.<sup>3186</sup> Intact vials of the concentrate for injection and intact vials and bags of the ready-to-use solutions should be stored at controlled room temperature and retained in the original carton to protect from light.<sup>3186 3187 3188 3189</sup> At least one manufacturer states that its vials of the ready-to-use solution should not be refrigerated;<sup>3187</sup> all manufacturers of argatroban state that freezing should be avoided.<sup>3186 3187 3188 3189</sup>

The solution for infusion should be visually inspected for particulate matter and discoloration prior to administration; if precipitation is present or if cloudiness occurs, the solution should not be used and should be discarded.<sup>3186 3187 3188 3189</sup>

Several manufacturers of the concentrate for injection state that solutions of argatroban diluted for infusion as recommended are stable for 24 hours at 20 to 25°C in ambient indoor light, and therefore, light-resistant measures (e.g., foil protection of the intravenous line) are unnecessary.<sup>3186 3191</sup> Solutions diluted for infusion should not be exposed to direct sunlight.<sup>3186</sup>

### Sorption

No substantial potency losses have been reported following simulated delivery of the diluted solution for infusion through intravenous tubing.<sup>3186</sup>

### Administration

Aripiprazole injection is administered by deep intramuscular injection only. Other routes should not be used.<sup>1(8/08)</sup>

### Stability

Intact vials of aripiprazole should be stored in the original cartons at controlled room temperature.<sup>1(8/08)</sup>

## Arsenic Trioxide

### AHFS 10:00

#### Products

Arsenic trioxide is available as a 1-mg/mL solution in 10-mL ampuls.<sup>2860</sup> Sodium hydroxide and hydrochloric acid are used during manufacturing to adjust the pH.<sup>2860</sup>

#### pH

From 7.5 to 8.5.<sup>2860</sup>

#### Trade Name(s)

Trisenox

#### Administration

Arsenic trioxide must be diluted with 100 to 250 mL of dextrose 5% or sodium chloride 0.9% for use.<sup>2860</sup> After dilution, the drug

is administered by intravenous infusion over 1 to 2 hours; the duration of infusion may be extended up to 4 hours in certain patients.<sup>2860</sup> A central venous catheter is *not* required for administration.<sup>2860</sup>

#### Stability

Arsenic trioxide injection is a clear and colorless solution.<sup>2860</sup> Intact ampuls should be stored at room temperature and protected from freezing.<sup>2860</sup> Discard unused portions of the drug properly.<sup>2860</sup>

## Compatibility Information

## Ascorbic Acid

### AHFS 88:12

#### Products

Ascorbic acid is provided as a sodium ascorbate solution equivalent to 500 mg/mL of ascorbic acid in 1- and 2-mL containers. The pH may be adjusted with sodium bicarbonate or sodium hydroxide. Edetate disodium and sodium hydrosulfite 0.5% antioxidant may also be present.<sup>1(6/07)</sup>

Pressure may build up during storage of containers of ascorbic acid. At room temperature, the pressure may become excessive. When opening ascorbic acid, ampuls should be wrapped in a protective covering.<sup>1(6/07)</sup>

#### pH

From 5.5 to 7.<sup>1(6/07)</sup>

#### Administration

Intramuscular injection of ascorbic acid is preferred, but it may also be given subcutaneously or intravenously.<sup>1(6/07)</sup> 4 Intravenously, it should be added to a large volume of a compatible diluent and infused slowly.<sup>1(6/07)</sup>

#### Stability

To avoid excessive pressure inside the ampuls, they should be stored in the refrigerator and not allowed to stand at room temperature before use.<sup>1(6/07)</sup>

Although refrigeration is recommended, Lilly has stated that its ascorbic acid had a maximum room temperature stability of 96 hours.<sup>853</sup> Intact ampuls of commercial ascorbic acid (Vitarine) have been reported to be stable for 4 years at room temperatures not exceeding 25°C.<sup>60</sup>

Ascorbic acid in solution is rapidly oxidized in air and alkaline media.<sup>4 2292</sup>

The stability of ascorbic acid from a multiple vitamin product in dextrose 5% and sodium chloride 0.9%, in both PVC and

ClearFlex containers, was evaluated. Analysis showed that ascorbic acid was stable at 23°C when protected from light, exhibiting less than a 10% loss in 24 hours. When exposed to light, however, ascorbic acid had losses of approximately 50 to 65% in 24 hours.<sup>1509</sup>

Ascorbic acid (Abbott) develops a grayish-brown color if left exposed to a stainless steel 5- $\mu$ m filter needle (Monoject) for as little as 1 hour.<sup>1645</sup>

In one study, ascorbic acid (McGuff) was diluted to 30 mg/mL in sodium chloride 0.9% and 50 mg/mL in dextrose 5%.<sup>3525</sup> Spectrophotometric evaluation showed that the concentration of ascorbic acid remained greater than 90% for up to 96 hours in solutions stored at 4°C in the dark and in those stored at ambient temperature and light.<sup>3525</sup>

#### pH Effects

Literature reports of incompatibilities between various acid-labile drugs such as penicillin G potassium<sup>47 165</sup> and erythromycin lactobionate<sup>20</sup> with pure ascorbic acid do not pertain to ascorbic acid injection, USP. The official product has a pH of 5.5 to 7.<sup>4 17</sup> and exists as a mixture of sodium ascorbate and ascorbic acid, with the sodium salt predominating. Pure ascorbic acid is quite acidic. A solution of ascorbic acid 500 mg in 2 mL of diluent had a pH of 2. The incompatibilities between pure ascorbic acid and penicillin G potassium have been attributed to the pH rather than being a characteristic of the ascorbate ion.<sup>166</sup>

#### Light Effects

Ascorbic acid gradually darkens on exposure to light. A slight color developed during storage does not impair the therapeutic activity.<sup>4</sup> Protect the intact containers from light by keeping them in the carton until ready for use.<sup>1(6/07)</sup>

#### Sorption

Pure ascorbic acid (Merck) did not display significant sorption to a PVC plastic test strip in 24 hours.<sup>12</sup>

## Additional Compatibility Information

### Parenteral Nutrition Solutions

A 35% ascorbic acid loss was reported from a parenteral nutrition solution, composed of amino acids, dextrose, electrolytes, trace elements, and multivitamins, in 39 hours at 25°C with exposure to light. The loss was reduced to a negligible amount in 4 days by refrigeration and light protection.<sup>1063</sup>

The extent and rapidity of ascorbic acid decomposition in parenteral nutrition solutions composed of amino acids, dextrose, electrolytes, multivitamins, and trace elements in 3-L PVC bags stored at 3 to 7°C was reported. About 30 to 40% was lost in 24 hours. The degradation then slowed as the oxygen supply was reduced to the diffusion through the bag. About a 55 to 65% loss occurred after 7 days of storage. The oxidation was catalyzed by metal ions, especially copper. In the absence of copper from the trace elements additive, less

than 10% degradation of ascorbic acid occurred in 24 hours. The author estimated that 150 to 200 mg is degraded in 2 to 4 hours at ambient temperature in the presence of copper, but that only 20 to 30 mg is broken down in 24 hours without copper. To minimize ascorbic acid loss, copper must be excluded. Alternatively, inclusion of excess ascorbic acid was suggested.<sup>1056</sup>

Extensive decomposition of ascorbic acid and folic acid was reported in a parenteral nutrition solution composed of amino acids 3.3%, dextrose 12.5%, electrolytes, trace elements, and M.V.I.-12 (USV) in PVC bags. Half-lives were 1.1, 2.9, and 8.9 hours for ascorbic acid and 2.7, 5.4, and 24 hours for folic acid stored at 24°C in daylight, 24°C protected from light, and 4°C protected from light, respectively. The decomposition was much greater than for solutions not containing catalyzing metal ions. Also, it was greater than for the vitamins singly because of interactions with the other vitamins present.<sup>1059</sup>

Ascorbic acid decomposition in TPN admixtures has been reported to result in the formation of precipitated calcium oxalate. Oxalic acid forms as one of the decomposition products of ascorbic acid. The oxalic acid reacts with calcium in the TPN admixture to form the precipitate.<sup>1060</sup>

The stability of numerous vitamins in parenteral nutrition solutions composed of amino acids (Kabi-Vitrum), dextrose 30%, and fat emulsion 20% (Kabi-Vitrum) in a 2:1:1 ratio with electrolytes, trace elements, and both fat- and water-soluble vitamins was reported. The admixtures were stored in darkness at 2 to 8°C for 96 hours. Sodium ascorbate and its biologically active degradation product, dehydroascorbic acid, totaled 59 and 42% of the nominal starting concentration at 24 and 96 hours, respectively. However, the actual initial concentration was only 66% of the nominal concentration.<sup>1225</sup>

When the admixture was subjected to simulated infusion over 24 hours at 20°C, either exposed to room light or light protected, or stored for 6 days in the dark under refrigeration and then subjected to the same simulated infusion, once again the retinyl palmitate, alpha-tocopherol, and sodium riboflavin-5'-phosphate did not undergo significant loss. However, sodium ascorbate and its degradation product, dehydroascorbic acid, had initial combined concentrations of 51 to 65% of the nominal initial concentration, with further declines during infusion. Light protection did not significantly alter the loss of total ascorbic acid.<sup>1225</sup>

The stability of ascorbic acid in parenteral nutrition solutions, with and without fat emulsion, was studied. Both with and without fat emulsion, the total vitamin C content (ascorbic acid plus dehydroascorbic acid) remained above 90% for 12 hours when the solutions were exposed to fluorescent light and for 24 hours when they were protected from light. When stored in a cool dark place, the solutions were stable for 7 days.<sup>1227</sup>

The stability of several vitamins from M.V.I.-12 (Armour) was reported when admixed in parenteral nutrition solutions composed of different amino acid products, with or without Intralipid 10%, when stored in glass bottles and PVC bags at 25 and 5°C for 48 hours. Ascorbic acid was lost from all samples stored at 25°C, with the greatest losses occurring in solutions stored in plastic bags. No losses occurred in any sample stored at 5°C.<sup>1431</sup>

In another study, the stability of several vitamins (as M.V.I.-12) following admixture with 4 different amino acid products (Novamine, Neopham, FreAmine III, Travasol) with or without Intralipid was reported when stored in glass bottles or PVC bags at 25°C for 48 hours. Under high-intensity phototherapy light, ascorbic acid losses were significant with all amino acid products tested. When bisulfite was added to the Neopham admixture, ascorbic acid was unaffected. Ascorbic acid losses were increased with a more alkaline pH and that bisulfite addition offered some protection presumably by bisulfite being preferentially oxidized. The authors concluded that intravenous multivitamins should be added to parenteral nutrition admixtures immediately prior to administration to reduce losses since commercially available amino acid products may contain bisulfites and have varying pH values.<sup>487</sup>

The stability of ascorbic acid and dehydroascorbic acid was evaluated in a 3-in-1 admixture containing Vamin 14, dextrose 30%, Intralipid 20%, potassium phosphate, Cernevit, and trace elements in ethylene vinyl acetate (EVA) bags over a temperature range of 2 to 22°C. They observed an 89% loss of ascorbic acid and 37% loss of dehydroascorbic acid over 7 days. Oxygen, trace elements, temperature, and an underfilled bag were the greatest determinants of ascorbic acid loss.<sup>2462</sup>

The long-term stability of ascorbic acid in 3-in-1 admixtures containing amino acids (Eloamin) 10%, dextrose 20%, fat emulsion (Elolipid) 20%, calcium gluconate, M.V.C. 9 + 3, and trace elements mixed in EVA and multilayer (Ultrastab) bags at 5°C was evaluated. Ascorbic acid losses were greater than 75% in the first 24 hours and 100% after 48 to 72 hours in the EVA bags. In the multilayer bags, ascorbic acid showed a 20 and 40% loss over the first 24 hours with and without fat emulsion, respectively. The initial rapid fall in ascorbic acid was presumably due to the initial oxygen content of the admixtures despite the use of the less oxygen-permeable multilayer bags. The ascorbic acid concentration remained stable for up to 28 days in the multilayer bags after the initial fall. Adding additional ascorbic acid to compensate for the losses was recommended to facilitate extended shelf-life.<sup>2463</sup>

Because of these interactions, recommendations to separate the administration of vitamins and trace elements have been made.<sup>1056 1060 1061</sup> Other researchers have termed such recommendations premature based on differing reports<sup>895 896</sup> and the apparent absence of epidemic vitamin deficiency in parenteral nutrition patients.<sup>1062</sup>

The influence of several factors on the rate of ascorbic acid oxidation in parenteral nutrition solutions was evaluated. Ascorbic acid is regarded as the least stable component in TPN admixtures. The type of amino acid used in the TPN was important. Some, such as FreAmine III and Vamin 14, contain antioxidant compounds (e.g., sodium metabisulfite or cysteine). Ascorbic acid stability was better in such solutions compared with those amino acid solutions having no antioxidant present. Furthermore, the pH of the solution may play a small role, with greater degradation as the pH rises from about 5 to about 7. Adding air to a compounded TPN container can also accelerate ascorbic acid decomposition. The most important factor was the type of plastic container used for the TPN. EVA containers (Mixieva, Miramed) allow more oxygen permeation, which results in substantial losses of ascorbic acid in relatively short time periods. In multilayer TPN bags (Ultrastab, Miramed) designed to reduce gas permeability, the rate of ascorbic acid degradation was greatly reduced. TPNs without antioxidants packaged in EVA bags had an almost total loss of ascorbic acid activity in 1 or 2 days at 5°C. In contrast, in TPNs containing FreAmine III or Vamin 14 and packaged in the multilayer bags, most of the ascorbic acid content was retained for 28 days at 5°C. The TPNs made with antioxidant-containing amino acids and packaged in multilayer bags that reduce gas permeability can safely be given extended expiration dates and still retain most of the ascorbic acid activity.<sup>2163</sup>

The initial degradation product of ascorbic acid (dehydroascorbic acid) was evaluated in a 2-in-1 admixture containing Synthamin 14, glucose 20%, and trace elements over a temperature range of 5 to 35°C. The presence of trace elements, including copper, had no influence on the degradation of dehydroascorbic acid. At room temperature and 5°C, there was a greater than 50% loss of dehydroascorbic acid noted within 2 and 24 hours, respectively. The authors concluded this degradation was temperature dependent.<sup>2461</sup>

The degradation of vitamins A, B1, C, and E from Cernevit (Roche) multivitamins was evaluated in NuTRIflex Lipid Plus (B. Braun) admixtures prepared in ethylene vinyl acetate (EVA) bags and in multilayer bags. After storage for up to 72 hours at 4, 21, and 40°C, greater vitamin losses occurred in the EVA

bags: vitamin A (retinyl palmitate) losses were 20%, thiamine hydrochloride losses were 25%, alpha-tocopherol losses were 20%, and ascorbic acid losses were approximately 80 to 100%. In the multilayer bags (presumably a better barrier to oxygen transfer), losses were less: vitamin A (retinyl palmitate) losses were 5%, thiamine hydrochloride losses were 10%, alpha-tocopherol losses were 0%, and ascorbic acid losses were approximately 25 to 70%.<sup>2618</sup>

The vitamins in Cernevit (Baxter) diluted in three 2-in-1 parenteral nutrition admixtures were tested for stability over 48 hours. While all of the vitamins retained their initial concentrations, ascorbic acid exhibited losses of about 5%, 13%, and 17% in TPNs with dextrose concentrations of 10, 15, and 25%, respectively.<sup>2796</sup>

## Asparaginase *Erwinia chrysanthemi*

AHFS 10:00

### Products

Asparaginase *Erwinia chrysanthemi* is available as a lyophilized powder in vials containing 10,000 international units of the drug.<sup>2896</sup> Each vial also contains glucose monohydrate 5 mg and sodium chloride 0.5 mg.<sup>2896</sup>

Reconstitute each vial with 1 or 2 mL of preservative-free sodium chloride 0.9% to yield solutions of 10,000 or 5000 international units/mL, respectively.<sup>2896</sup> Direct the stream of diluent at the vial wall and not directly into the powder.<sup>2896</sup> Swirl or gently mix to dissolve the powder; do not shake or invert the vial.<sup>2896</sup>

### Trade Name(s)

Erwinaze

### Administration

Asparaginase *Erwinia chrysanthemi* is administered intramuscularly using a volume no greater than 2 mL; larger volumes require 2 injection sites.<sup>2896</sup>

### Stability

Intact vials and cartons of asparaginase *Erwinia chrysanthemi* should be stored under refrigeration and protected from light.<sup>2896</sup>

Asparaginase *Erwinia chrysanthemi*, a white lyophilized powder, becomes a clear, colorless solution on reconstitution.<sup>2896</sup> If any visible particles or protein aggregates are present, the reconstituted solution should be discarded.<sup>2896</sup>

The volume of the reconstituted solution containing the calculated dose should be withdrawn from the vial into a polypropylene syringe within 15 minutes of reconstitution and administered within 4 hours.<sup>2896</sup> The manufacturer indicates that the reconstituted solution should not be stored under refrigeration or frozen.<sup>2896</sup> Any unused portions should be discarded.<sup>2896</sup>

## Atracurium Besylate

AHFS 12:20.20

### Products

Atracurium besylate is available as a 10-mg/mL aqueous solution in 5-mL single-use vials and 10-mL multiple-dose vials with benzyl alcohol 0.9% as a preservative. The pH is adjusted with benzenesulfonic acid.<sup>1(1/04)</sup>

### pH

Adjusted to 3.25 to 3.65.<sup>1(1/04)</sup>

### Administration

Atracurium besylate is administered by rapid intravenous injection or by intravenous infusion in concentrations of 0.2 and 0.5 mg/mL. It must not be given by intramuscular injection. Do not administer in the same syringe or through the same needle as an alkaline solution.<sup>1(1/04) 4</sup>

### Stability

Atracurium besylate injection is a clear, colorless solution; it should be stored under refrigeration and protected from freezing. Nevertheless, the drug undergoes slow decomposition of about 6% per year.<sup>1(1/04) 4</sup> The estimated  $t_{90}$  at 5°C is approximately 18 months.<sup>859</sup> At 25°C, the rate of decomposition is stated to increase to about 5% per month.<sup>1(1/04) 4</sup> The manufacturers have indicated that intact vials of atracurium besylate may be used for 14 days when stored at room temperature.<sup>1(1/04) 1181</sup>

Other research indicates that atracurium besylate injection in intact containers may be stable even longer at room temperature. Intact containers were found to retain 92% of the concentration after 3 months at 20°C.<sup>777</sup>

### pH Effects

Atracurium besylate is unstable in the presence of both acids and bases.<sup>4</sup> Maximum stability in aqueous solution was observed at about pH 2.5.<sup>859</sup>

Atracurium besylate, which has an acid pH, should not be mixed with alkaline solutions such as barbiturates. The atracurium besylate may be inactivated and precipitation of a free acid of the admixed drug may occur, depending on the resultant pH.<sup>4</sup>

### Syringes

Atracurium besylate (Burroughs Wellcome) 10 mg/mL was repackaged as 10 mL of solution in 12-mL plastic syringes (Monoject) and stored at 5, 25, and 40°C. The samples remained visually clear throughout the study. No loss occurred in the refrigerated samples and about 4% loss occurred in the room temperature samples after 42 days of storage. At 40°C, 15% was lost in 21 days. Exposure of atracurium to elevated temperatures should be avoided.<sup>2141</sup>

Atracurium 10 mg/mL repackaged in polypropylene syringes exhibited little change in concentration after 4 weeks of storage at room temperature when not exposed to direct light.<sup>2164</sup>

# Atropine Sulfate

**AHFS 12:08.08**

## Products

Atropine sulfate injection is available at concentrations of 0.4 mg/mL and 1 mg/mL in 1-mL single-dose (preservative-free) vials<sup>3448</sup> and at a concentration of 0.4 mg/mL in 20-mL multiple-dose vials.<sup>3447 3450</sup> Sodium chloride is present for isotonicity, and sulfuric acid may have been used to adjust the pH.<sup>3447 3448 3450</sup> Multiple-dose vials also contain benzyl alcohol as a preservative.<sup>3447 3450</sup>

Atropine sulfate also is available in a concentration of 0.05 mg/mL in 5-mL single-dose prefilled syringes and 0.1 mg/mL in 5- and 10-mL single-dose prefilled syringes.<sup>3445 3446 3449</sup> Sodium chloride is present for isotonicity.<sup>3445 3446 3449</sup> Some syringes may contain sodium hydroxide and/or sulfuric acid to adjust the pH.<sup>3445 3446</sup> Some syringes contain citric acid and sodium citrate as buffers and may contain additional amounts of citric acid and/or sodium citrate to adjust the pH.<sup>3449</sup>

Atropine sulfate also is available in 0.25-, 0.5-, 1-, and 2-mg auto-injector syringes for self or caregiver intramuscular administration in the treatment of nerve agent and insecticide poisoning only.<sup>3451</sup>

## pH

Single-dose vials: From 3 to 6.5.<sup>3448</sup>

Multiple-dose vials: From 3 to 3.8 (Fresenius Kabi)<sup>3447</sup> or from 3 to 6.5 (West-Ward).<sup>3450</sup>

Prefilled syringes: From 3 to 6.5.<sup>3445 3446 3449</sup>

Auto-injector syringes: From 4 to 5.<sup>3451</sup>

## Osmolarity

Atropine sulfate injection has a calculated osmolarity of 308 mOsm/L.<sup>3445 3446</sup>

## Administration

Atropine sulfate injection may be administered by the intravenous, subcutaneous, intramuscular, or intraosseous routes.<sup>3445 3446 3447 3448 3449 3450</sup> Specific product labeling should be consulted for details on the routes of administration that are recommended for each individual product.

## Stability

Atropine sulfate injection should be stored at controlled room temperature.<sup>3445 3446 3447 3448 3449 3450</sup> One manufacturer states

that multiple-dose vials should be stored at 20 to 25°C after initial use and should be discarded within 24 hours.<sup>3447</sup>

## pH Effects

Minimum hydrolysis occurs at pH 3.5.<sup>1072</sup>

## Temperature Effects

Atropine sulfate 0.1 mg/mL in auto-injector syringes (Abbott) was evaluated for stability over 45 days under use conditions in paramedic vehicles. Temperatures fluctuated with locations and conditions and ranged from 6.5°C (43.7 °F) to 52°C (125.6 °F) in high desert conditions. No visually apparent changes occurred, and little or no loss of atropine sulfate was found.<sup>2548</sup>

In another study, atropine sulfate injection under simulated summer conditions in paramedic vehicles was exposed to temperatures ranging from 26 to 38°C over 4 weeks. Analysis found no loss of the drug under these conditions.<sup>2562</sup>

## Syringes

In 2015, reports of decreased potency of certain drugs (e.g., atropine sulfate) stored in Becton Dickinson syringes for extended periods (i.e., exceeding 24 hours) were confirmed by the manufacturer of these syringes; the cause of this change was later identified to be the inclusion of an alternate rubber stopper in the plunger of certain product lots of syringes.<sup>3029 3036 3037 3039 3041 3042</sup> Decreased potency was not observed when the syringes were filled and used promptly.<sup>3037</sup> Use of the alternate stopper was later discontinued and use of the primary stopper in such syringes was resumed; however, Becton Dickinson states that its general-use syringes are cleared by FDA for immediate use in fluid aspiration and injection and that such syringes, regardless of the stopper material, have not been cleared by FDA for use as a closed-container system.<sup>3391</sup>

Atropine 1 mg/mL repackaged in polypropylene syringes exhibited little change in concentration after 4 weeks of storage at room temperature not exposed to direct light.<sup>2164</sup>

Extemporaneously compounded atropine sulfate 2-mg/mL injection in sodium chloride 0.9% for use in the event of a terrorist nerve gas attack was packaged in polypropylene syringes (Becton Dickinson) with sealed tips. The injection was adjusted to pH 3.5 with sulfuric acid during compounding. No visible changes were reported, and analysis found no loss of the drug over 364 days at 5°C protected from light, 364 days at 23°C exposed to light, and 28 days at 35°C exposed to light.<sup>2781</sup>

# Azacitidine

## AHFS 10:00

### Products

Azacitidine is available as a lyophilized powder in single-use (preservative-free) vials in a formulation containing 100 mg of azacitidine and 100 mg of mannitol.<sup>3325</sup> Azacitidine (Actavis) also is available as a lyophilized powder in single-use (preservative-free) vials in a formulation containing 100 mg of azacitidine with sucrose 170 mg, monosodium phosphate monohydrate, and disodium hydrogen phosphate dihydrate.<sup>3326</sup>

To prepare a suspension of azacitidine for subcutaneous administration from either formulation, the powder contents of one vial should be reconstituted by slowly injecting 4 mL of sterile water for injection into the vial.<sup>3325 3326</sup> The vial should be shaken vigorously or rolled until a uniform, cloudy suspension results.<sup>3325 3326</sup> The suspension will have a final azacitidine concentration of 25 mg/mL.<sup>3325 3326</sup>

To prepare a solution of azacitidine for intravenous administration from either formulation, each 100-mg vial of azacitidine should be reconstituted with 10 mL of sterile water for injection.<sup>3325 3326</sup> Vials should be vigorously shaken or rolled until all solids are dissolved and a clear solution results.<sup>3325 3326</sup> The solution will have a final azacitidine concentration of 10 mg/mL.<sup>3325 3326</sup> The appropriate dose of the reconstituted solution should be withdrawn from the vial and diluted in 50 to 100 mL of sodium chloride 0.9% or Ringer's injection, lactated.<sup>3325 3326</sup>

### Trade Name(s)

Vidaza

### Administration

Azacitidine may be administered subcutaneously as a suspension or intravenously as a solution.<sup>3325 3326</sup>

Prior to subcutaneous administration, the reconstituted suspension may be allowed to come to room temperature for up to 30 minutes if it has been refrigerated.<sup>3325 3326</sup> The suspension should be resuspended immediately prior to subcutaneous administration by vigorously rolling the container between the palms until a uniform, cloudy suspension is achieved.<sup>3325 3326</sup> For doses exceeding a volume of 4 mL of the reconstituted suspension, the total dose should be divided equally into 2 syringes and injected into 2 separate sites.<sup>3325 3326</sup> Injection sites should be rotated.<sup>3325 3326</sup>

For intravenous infusion, the final diluted solution should be administered over 10 to 40 minutes.<sup>3325 3326</sup>

As with other toxic drugs, applicable special handling and disposal procedures for azacitidine should be followed.<sup>3325 3326</sup>

### Stability

Azacitidine is a white to off-white powder.<sup>3325 3326</sup> Intact vials should be stored at controlled room temperature.<sup>3325 3326</sup>

The reconstituted suspension of azacitidine intended for immediate subcutaneous administration may be held at 25°C for up to 1 hour, but must be administered within 1 hour after reconstitution.<sup>3325 3326</sup> One manufacturer recommends administration of the reconstituted suspension within 45 minutes of preparation when intended for immediate use.<sup>3327</sup>

Stability of the reconstituted suspension intended for delayed subcutaneous administration differs between the two formulations of azacitidine;<sup>3325 3326</sup> the sucrose-containing formulation (Actavis) has demonstrated improved stability of the reconstituted suspension compared with the original mannitol-containing formulation.<sup>3328</sup> If either formulation of the reconstituted suspension is intended for delayed subcutaneous administration, the suspension must be stored in the refrigerator immediately following reconstitution, either in the vial or drawn into a syringe.<sup>3325 3326</sup> For the mannitol-containing formulation, when cold sterile water for injection (stored at 2 to 8°C) is used for reconstitution, the resulting suspension may be stored at 2 to 8°C for up to 22 hours; when sterile water for injection that has not been refrigerated is used for reconstitution, the resulting suspension may be stored at 2 to 8°C for only up to 8 hours.<sup>3325</sup> For the sucrose-containing formulation, when cold sterile water for injection (stored at 2 to 8°C) is used for reconstitution, the resulting suspension may be stored at 2 to 8°C for up to 30 hours; when sterile water for injection that has not been refrigerated is used for reconstitution, the resulting suspension may be stored at 2 to 8°C for only up to 12 hours.<sup>3326</sup>

When cold sterile water for injection is used for reconstitution, some authors have noted that sterile water for injection in glass bottles and ampuls of various sizes stored at 2 to 8°C quickly increased in temperature within 15 minutes after removal from refrigeration, which could potentially impact the subsequent stability of the drug.<sup>3329</sup> To combat this problem, these authors have suggested freezing 20-mL ampuls of sterile water for injection and thawing them for 30 minutes prior to use.<sup>3329</sup> After thawing, ampuls should be agitated for 30 seconds prior to removing the volume needed for reconstitution.<sup>3329</sup>

If either formulation is reconstituted to a solution and further diluted for intravenous infusion, administration of the diluted solution for infusion must be completed within 1 hour of reconstitution.<sup>3325 3326</sup>

Azacitidine (Celgene) 10-mg/mL solution and 25-mg/mL suspension prepared with room temperature sterile water for injection and stored in glass vials at 23°C demonstrated less than 10% loss in 2.4 hours;<sup>3330</sup> when prepared with cold (4°C) sterile water for injection and stored in glass vials at 4°C, this formulation demonstrated less than 10% loss in 1 day.<sup>3330</sup>

### pH Effects

Maximum stability of azacitidine has been reported at a pH ranging from 6.5 to 7.<sup>741 969</sup>

## Temperature Effects

Azacitidine is very sensitive to temperature,<sup>3329 3330</sup> degrading quickly at room temperature.<sup>3325 3326</sup>

## Freezing Solutions

Azacitidine (National Cancer Institute) 0.5- and 2-mg/mL solutions prepared with ice-cold (specific temperature not defined) Ringer's injection, lactated and stored in 50-mL polypropylene syringes (Becton Dickinson) were stable for 2 weeks at  $-20^{\circ}\text{C}$  followed by 1 hour at room temperature after thawing over 30 to 45 minutes.<sup>1519</sup>

Azacitidine (Celgene) 10-mg/mL solution prepared with cold ( $4^{\circ}\text{C}$ ) sterile water for injection and stored in glass vials and polypropylene syringes (Becton Dickinson) at  $-20^{\circ}\text{C}$  demonstrated little to no loss in 23 days.<sup>3330</sup>

## Freezing Suspensions

Azacitidine (Celgene) 25-mg/mL suspension prepared with cold ( $4^{\circ}\text{C}$ ) sterile water for injection and stored in glass vials and

polypropylene syringes (Becton Dickinson) at  $-20^{\circ}\text{C}$  demonstrated little to no loss in 23 days.<sup>3330</sup>

Azacitidine (Celgene) 25-mg/mL suspension prepared with ice-cold water (specific temperature not defined) and stored in polypropylene syringes for 8 days at  $-20^{\circ}\text{C}$  followed by thawing at room temperature (i.e., 23 to  $25^{\circ}\text{C}$ ) for 30 minutes with or without subsequent storage for 8 hours at 2 to  $8^{\circ}\text{C}$  demonstrated a loss of less than 5%.<sup>3331</sup> Neither changes in color of the suspension nor partial dissolution of the suspension was noted throughout the study.<sup>3331</sup>

## Syringes

Azacitidine (Celgene) 10-mg/mL solution and 25-mg/mL suspension prepared with cold ( $4^{\circ}\text{C}$ ) sterile water for injection and stored in polypropylene syringes (Becton Dickinson) at  $4^{\circ}\text{C}$  demonstrated less than 10% loss in 1 day.<sup>3330</sup>

## Filtration

Filtration of azacitidine suspension could result in removal of the drug; the suspension should *not* be filtered.<sup>3325 3326</sup>

# Azathioprine Sodium

AHFS 92:44

## Products

Azathioprine sodium is available in 20-mL vials containing the equivalent of 100 mg of azathioprine with sodium hydroxide to adjust the pH. Reconstitute by adding 10 mL of sterile water for injection and swirling until a clear solution results.<sup>1(5/08)</sup>

### pH

Approximately 9.6.<sup>1(5/08)</sup>

### Trade Name(s)

Imuran

## Administration

Azathioprine sodium is administered intravenously. Infusions are usually administered over 30 to 60 minutes but have been given over five minutes to eight hours.<sup>1(5/08) 4</sup>

In the event of spills or leaks, the manufacturer recommends sodium hypochlorite 5% (household bleach) and sodium hydroxide (concentration unspecified) to inactivate azathioprine.<sup>1200</sup>

## Stability

Azathioprine sodium, a yellow powder, should be stored at controlled room temperature and protected from light. It is

stated to be stable in neutral or acid solutions but is hydrolyzed to mercaptopurine in alkaline solutions,<sup>1(5/08) 4</sup> especially on warming.<sup>1(5/08)</sup> Maximum stability occurs at pH 5.5 to 6.5.<sup>1633</sup> Hydrolysis to mercaptopurine also occurs in the presence of sulfhydryl compounds such as cysteine.<sup>1(5/08) 4</sup>

Use of azathioprine sodium within 24 hours after reconstitution is recommended because the product contains no preservatives.<sup>1(5/08) 4</sup> Azathioprine sodium is stated to be incompatible with methylparaben, propylparaben, and phenol.<sup>108</sup> Chemically, azathioprine sodium 10 mg/mL in aqueous solution is stable for about two weeks at room temperature.<sup>4</sup> After this time, hydrolysis of azathioprine to mercaptopurine increases.

Storage of the reconstituted solution in the original vial and in plastic syringes (Jelco) at 20 to 25°C under fluorescent light resulted in no decomposition or precipitation in 16 days. At 4°C in the dark, a visible precipitate formed after four days.<sup>605</sup>

Azathioprine sodium (Burroughs Wellcome) 100 mg/50 mL diluted in dextrose 5%, sodium chloride 0.9%, or sodium chloride 0.45% in PVC bags (Travenol) was stored at 20 to 25°C under fluorescent light and at 4°C in the dark. No decomposition occurred in the solutions over 16 days of storage. However, a precipitate formed in the dextrose 5% admixtures by the 16th day. No precipitate was observed after eight days of storage.<sup>605</sup>

# Azithromycin

AHFS 8:12.12.92

## Products

Azithromycin is available as a powder in vials containing the equivalent of 500 mg of azithromycin (as the dihydrate<sup>2863</sup> or monohydrate<sup>3286</sup>) along with citric acid and sodium hydroxide.<sup>2863 3286</sup> The drug is packaged under vacuum.<sup>2863 3286</sup> Each 500-mg vial should be reconstituted with 4.8 mL of sterile water for injection and shaken until the drug is dissolved yielding a 100-mg/mL solution.<sup>2863 3286</sup> Because of the vacuum, a non-automated syringe is recommended to ensure that the correct amount of diluent is added.<sup>2863 3286</sup>

## Trade Name(s)

Zithromax

## Administration

Azithromycin is administered only by intravenous infusion after dilution to a concentration of 1 or 2 mg/mL in a compatible infusion solution.<sup>2863 3286</sup> Diluted solutions with a final concentration of 1 mg/mL should be infused over 3 hours; diluted solutions with a final concentration of 2 mg/mL should be infused over 1 hour.<sup>2863 3286</sup> Azithromycin should not be given by direct intravenous or intramuscular injection.<sup>2863 3286</sup>

## Stability

Intact vials should be stored at or below 30°C<sup>2863</sup> or at controlled room temperature.<sup>3286</sup> The reconstituted solution is stable for 24 hours below 30°C.<sup>2863 3286</sup>

## Aztreonam

AHFS 8:12.07.16

### Products

Aztreonam is available in vials containing 1 or 2 g of the drug.<sup>2864</sup><sup>2866</sup> Aztreonam also is available in 1- and 2-g sizes as frozen premixed injection solutions in dextrose 3.4 and 1.4%, respectively, in single-dose Galaxy containers for intravenous infusion.<sup>2865</sup> Both preparations contain approximately 780 mg of arginine per gram of aztreonam.<sup>2864</sup> <sup>2865</sup> <sup>2866</sup>

For intramuscular injection, each gram of aztreonam in vials should be reconstituted with at least 3 mL of one of the following diluents:<sup>2864</sup> <sup>2865</sup> <sup>2866</sup>

- Sterile water for injection
- Bacteriostatic water for injection (benzyl alcohol or parabens)
- Sodium chloride 0.9%
- Bacteriostatic sodium chloride 0.9% (benzyl alcohol)

For intravenous bolus injection, vials should be used.<sup>2864</sup> <sup>2866</sup> A vial should be reconstituted with 6 to 10 mL of sterile water for injection.<sup>2864</sup> <sup>2866</sup>

For intravenous infusion, a vial of aztreonam should be reconstituted with at least 3 mL of sterile water for injection per gram of aztreonam and further diluted with a compatible infusion solution.<sup>2864</sup> <sup>2866</sup>

On adding the diluent to the vial or bottle, the contents should be shaken immediately and vigorously.<sup>2864</sup> <sup>2866</sup> Any unused portion of the reconstituted solution should be discarded.<sup>2864</sup> <sup>2866</sup>

The frozen premixed injection solutions also may be used for intravenous infusion after thawing at room temperature (25°C) or at 2 to 8°C.<sup>2865</sup>

### pH

Aqueous solutions of aztreonam have pH values ranging from 4.5 to 7.5.<sup>2864</sup> <sup>2865</sup> <sup>2866</sup>

### Sodium Content

Aztreonam is sodium free.<sup>2864</sup> <sup>2865</sup> <sup>2866</sup>

### Trade Name(s)

Azactam

### Administration

Aztreonam may be administered by intravenous injection or infusion<sup>2864</sup> <sup>2865</sup> <sup>2866</sup> or by deep intramuscular injection into a large muscle mass.<sup>2864</sup> <sup>2866</sup> By intravenous injection, the dose should be administered slowly, over 3 to 5 minutes, directly into a vein or into the tubing of a compatible infusion solution.<sup>2864</sup> <sup>2866</sup> Intermittent infusion of aztreonam should be completed within 20 to 60 minutes.<sup>2864</sup> <sup>2865</sup> <sup>2866</sup> If Y-site administration of aztreonam is employed, careful attention should be paid to ensure administration of the full intended dose.<sup>2864</sup> <sup>2866</sup> A volume-control administration set may be used to dilute aztreonam in a compatible infusion solution during administration; however,

the final concentration of aztreonam administered in such a way should not exceed 2% (w/v).<sup>2864</sup> <sup>2866</sup>

### Stability

Intact vials should be stored at controlled room temperature; excessive heat should be avoided.<sup>2864</sup> <sup>2866</sup> Exposure to strong light may cause yellowing of the powder.<sup>3310</sup>

Aztreonam solutions range from colorless to light straw to yellow.<sup>2864</sup> <sup>2865</sup> <sup>2866</sup> They may develop a slight pink tint on standing without potency being affected.<sup>2864</sup> <sup>2866</sup>

Aztreonam solutions at concentrations of 2% (w/v) or less must be used within 48 hours if stored at controlled room temperature (15 to 30°C) or within 7 days at 2 to 8°C.<sup>2864</sup> <sup>2866</sup> Solutions with concentrations exceeding 2% (w/v) should be used immediately after preparation unless sterile water for injection or sodium chloride 0.9% is used.<sup>2864</sup> <sup>2866</sup> In these 2 excepted solutions, aztreonam at concentrations exceeding 2% (w/v) must be used within 48 hours if stored at controlled room temperature or within 7 days under refrigeration.<sup>2864</sup> <sup>2866</sup>

### Concentration Effects

In one study, aztreonam dissolved in sterile water for injection to concentrations greater than 100 g/L resulted in unacceptably viscous solutions that impeded flow from elastomeric pumps to less than 75% of the nominal flow rate.<sup>3105</sup>

### pH Effects

In aqueous solutions, aztreonam undergoes hydrolysis of the  $\beta$ -lactam ring. Specific base catalysis occurs at pH greater than 6. At pH 2 to 5, isomerization of the side chain predominates. The lowest rates of decomposition occur at pH 5 to 7, with maximum stability occurring at pH 6.<sup>1072</sup>

### Freezing Solutions

The commercially available frozen premixed injection solution should be stored in a freezer capable of maintaining the temperature at or below -20°C and should be thawed at room temperature (25°C) or at 2 to 8°C; solutions should not be refrozen.<sup>2865</sup> After thawing, the container should be inverted to ensure that the solution is well mixed.<sup>2865</sup> Solutions should not be subject to force thawing by immersion in water baths or microwaving.<sup>2865</sup> The manufacturer indicates that thawed solutions are stable for 48 hours at room temperature (25°C) or for 14 days at 2 to 8°C.<sup>2865</sup>

### Central Venous Catheter

Aztreonam (Squibb) 10 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

Cefazolin sodium	LI	5 and 20 g	SQ	10 and 20 g	D5W, NS <sup>a</sup>	Physically compatible. Little loss of either drug in 48 hr at 25°C and 7 days at 4°C in the dark	1020	C
Cefoxitin sodium	MSD	10 and 20 g	SQ	10 and 20 g	NS <sup>a</sup>	3 to 5% aztreonam loss and no cefoxitin loss in 7 days at 4°C	1023	C
Cefoxitin sodium	MSD	10 and 20 g	SQ	10 and 20 g	D5W <sup>a</sup>	3 to 6% cefoxitin loss and no aztreonam loss in 7 days at 4°C	1023	C
Cefoxitin sodium	MSD	10 and 20 g	SQ	10 and 20 g	D5W, NS <sup>a</sup>	Both drugs stable for 12 hr at 25°C. Yellow color and 6 to 12% aztreonam and 9 to 15% cefoxitin loss in 48 hr at 25°C	1023	I
Ciprofloxacin	BAY	1.6 g	SQ	39.7 g	D5W	Visually compatible with no loss of ciprofloxacin in 24 hr at 22°C under fluorescent light. Aztreonam not tested	2413	C
Clindamycin phosphate	UP	3 and 6 g	SQ	10 and 20 g	D5W, NS <sup>a</sup>	Physically compatible with little or no loss of either drug in 48 hr at 25°C and 7 days at 4°C	1002	C
Clindamycin phosphate	UP	9 g	SQ	20 g	D5W <sup>b</sup>	Physically compatible with 3% clindamycin loss and 5% aztreonam loss in 48 hr at 25°C under fluorescent light	1026	C
Clindamycin phosphate	UP	9 g	SQ	20 g	NS <sup>b</sup>	Physically compatible with 2% clindamycin loss and no aztreonam loss in 48 hr at 25°C under fluorescent light	1026	C
Gentamicin sulfate	SC	200 and 800 mg	SQ	10 and 20 g	D5W, NS <sup>a</sup>	Little aztreonam loss in 48 hr at 25°C and 7 days at 4°C. Gentamicin stable for 12 hr at 25°C and 24 hr at 4°C. Up to 10% loss in 48 hr at 25°C and 7 days at 4°C	1023	C
Linezolid	PHU	2 g	SQ	20 g	<sup>c</sup>	Physically compatible with no linezolid loss in 7 days at 4 and 23°C protected from light. About 9% aztreonam loss at 23°C and less than 4% loss at 4°C in 7 days	2263	C
Mannitol		50 and 100 g				Manufacturer-recommended solution	2864, 2866	C

**Additive Compatibility (Cont.)**

Test Drug	Mfr	Conc/L or %	Mfr	Conc/L or %	Test Solution	Remarks	Ref	C/I
Metronidazole	MG	5 g	SQ	10 and 20 g		Pink color develops in 12 hr, becoming cherry red in 48 hr at 25°C. Pink color develops in 3 days at 4°C. No loss of either drug detected	1023	I
Nafcillin sodium	BR	20 g	SQ	20 g	D5W, NS <sup>a</sup>	Cloudiness and precipitate form. 7% aztreonam and 11% nafcillin loss in 24 hr at room temperature	1028	I
Tobramycin sulfate	LI	200 and 800 mg	SQ	10 and 20 g	D5W, NS <sup>a</sup>	Little or no loss of either drug in 48 hr at 25°C and 7 days at 4°C	1023	C
Vancomycin HCl	AB	10 g	SQ	40 g	D5W, NS	Immediate microcrystalline precipitate. Turbidity and precipitate over 24 hr	1848	I
Vancomycin HCl	AB	1 g	SQ	4 g	D5W	Physically compatible. Little loss of either drug in 31 days at 4°C. 10% aztreonam loss in 14 days at 23°C and 7 days at 32°C	1848	C
Vancomycin HCl	AB	1 g	SQ	4 g	NS	Physically compatible. Little loss of either drug in 31 days at 4°C. 8% aztreonam loss in 31 days at 23°C and 7 days at 32°C	1848	C

<sup>a</sup> Tested in PVC containers.

<sup>b</sup> Tested in glass containers.

<sup>c</sup> Admixed in the linezolid infusion container.

<sup>d</sup> Ampicillin component. Ampicillin in a 2:1 fixed-ratio concentration with sulbactam.

**Drugs in Syringe Compatibility****Aztreonam**

<sup>t</sup> Test performed using the formulation WITH edetate disodium.

**Additional Compatibility Information****Peritoneal Dialysis Solutions**

Aztreonam (Bristol-Myers Squibb) was evaluated for stability at a concentration of 500 mg/L in Extraneal with icodextrin 7.5% (Baxter) and 400 mg/L in Nutrineal PD-4 with amino acids 1.1% (Baxter) at 6, 25, and 37°C protected from light.<sup>3563</sup> The drug also was evaluated for stability in 2-compartment Physioneal with dextrose 1.36% (Baxter) and Physioneal with dextrose 2.27% (Baxter).<sup>3563</sup> Bags of 2-compartment Physioneal with dextrose 1.36% and Physioneal with dextrose 2.27% contained aztreonam 1 g/L in one compartment (compartment composition unspecified) for storage at 6 and 25°C.<sup>3563</sup> For bags of Physioneal with dextrose intended for storage at 37°C, the initial concentration of aztreonam in one compartment also was 1 g/L; however, the 2 compartments were combined immediately prior to storage at 37°C for a final aztreonam concentration of 500 mg/L.<sup>3563</sup> Throughout the

study, no color change or precipitation was noted on visual assessment.<sup>3563</sup> In Extraneal with icodextrin 7.5%, aztreonam underwent little loss in 14 days at 6°C, less than 7% loss in 14 days at 25°C, and less than 4% loss in 24 hours at 37°C.<sup>3563</sup> In Nutrineal PD-4 with amino acids 1.1%, aztreonam underwent about 7% loss in 14 days at 6°C, about 6% loss in 3 days at 25°C, and about 5% loss in 24 hours at 37°C.<sup>3563</sup> In Physioneal with dextrose 1.36%, aztreonam in one compartment underwent about 3% loss in 14 days at 6°C and about 7% loss in 3 days at 25°C; with the compartments combined, aztreonam loss was about 6% in 2 hours at 37°C.<sup>3563</sup> In Physioneal with dextrose 2.27%, aztreonam loss in one compartment was less than 6% in 14 days at 6°C and about 8% in 3 days at 25°C; with the compartments combined, aztreonam loss was about 7% in 1 hour at 37°C.<sup>3563</sup>

Aztreonam with cloxacillin sodium and aztreonam with vancomycin hydrochloride admixtures are stable in Dianeal 137 with dextrose 4.25% for 24 hours at room temperature.<sup>2864 2866</sup>

## Bacitracin

AHFS 8:12.28.08

### Products

Bacitracin for injection is available as a lyophilized powder in vials containing 50,000 units of bacitracin.<sup>3317</sup> Vial contents should be dissolved in sodium chloride with procaine hydrochloride 2%.<sup>3317</sup> Diluents containing parabens should not be used for reconstitution; cloudy solutions have resulted and precipitate formation has occurred with the use of such diluents.<sup>3317</sup> Bacitracin for injection should be reconstituted to form a solution with a bacitracin concentration of 5000 to 10,000 units/mL.<sup>3317</sup> Reconstitution of a 50,000-unit vial with 9.8 mL of diluent results in a solution with a bacitracin concentration of 5000 units/mL.<sup>3317</sup>

### Administration

Bacitracin is administered by intramuscular injection only.<sup>3317</sup> Intramuscular injections of bacitracin should be administered into the upper outer quadrant of the buttocks, alternating between the right and left sides to avoid multiple injections into the same region.<sup>3317</sup> For infants, the daily dosage should be divided into 2 or 3 injections.<sup>3317</sup>

### Stability

Intact vials of bacitracin for injection should be stored under refrigeration at 2 to 8°C.<sup>3317</sup> Reconstituted solutions of bacitracin are stable for 1 week under refrigeration at 2 to 8°C.<sup>3317</sup>

© Copyright, February 2018. American Society of Health-System Pharmacists, Inc.

## Baclofen

### AHFS 12:20.12

### Products

Baclofen injection is available as a preservative-free injection for intrathecal use only at a concentration of 0.5 mg/mL in 20-mL ampuls, vials, and prefilled syringes; at a concentration of 1 mg/mL in 20-mL vials and prefilled syringes; and at a concentration of 2 mg/mL in 5-mL ampuls and 20-mL ampuls, vials, and prefilled syringes.<sup>2899 2900</sup> Each mL of solution contains baclofen 0.5, 1, or 2 mg (500, 1000, or 2000 mcg, respectively) with sodium chloride 9 mg in water for injection.<sup>2899 2900</sup>

Baclofen injection is also available as a preservative-free injection for intrathecal use only at a concentration of 0.05 mg/mL in 1-mL ampuls and prefilled syringes for use in screening.<sup>2899 2900</sup> Each mL of solution contains baclofen 0.05 mg (50 mcg) with sodium chloride 9 mg in water for injection.<sup>2899 2900</sup>

### pH

Gablofen: from 5.5 to 7.5.<sup>2900</sup> Lioresal Intrathecal: from 5 to 7.<sup>2899</sup>

### Tonicity

Baclofen injection is an isotonic solution.<sup>2899 2900</sup>

### Trade Name(s)

Gablofen, Lioresal Intrathecal

### Administration

For screening, 1-mL ampuls or prefilled syringes containing 50 mcg/mL of baclofen are used in the delivery of the drug by direct intrathecal injection via lumbar puncture or spinal catheter over at least one minute using barbotage.<sup>2899 2900</sup>

For maintenance treatment, baclofen injection is administered intrathecally by chronic, continuous infusion through an implantable infusion pump.<sup>2899 2900</sup> Baclofen injection (Gablofen) is intended for use only with the Medtronic SynchroMed II Programmable pump or other pumps labeled for intrathecal

administration of Gablofen;<sup>2900</sup> baclofen injection (Lioresal Intrathecal) is intended for use only in implantable pumps specifically labeled for the administration of Lioresal Intrathecal.<sup>2899</sup> The concentration of the solution to be infused is dependent upon the rate of infusion and the total daily dosage, which is titrated according to the patient's response.<sup>2899 2900</sup> For concentrations other than those that are commercially available, the drug must be diluted only with sterile, preservative-free sodium chloride.<sup>2899 2900</sup> The drug may also require dilution in sterile, preservative-free sodium chloride when used with certain implantable infusion pumps;<sup>2899</sup> the pump manufacturer's manual should be consulted for specific details.<sup>2899</sup>

The pump manufacturer's instructions for programming of the pump and filling and refilling of the pump reservoir should be followed.<sup>2899 2900</sup>

### Stability

Baclofen injection should be stored at temperatures not exceeding 30°C and protected from freezing.<sup>2899 2900</sup> The product is intended for use in implantable infusion pumps and is stable at a temperature of 37°C.<sup>2899 2900</sup> It should not be heat sterilized.<sup>2899 2900</sup> Each ampul, vial, or prefilled syringe contains no preservatives and is intended for single-use only; unused portions must be discarded.<sup>2899 2900</sup>

If necessary, baclofen injection must be diluted only with sterile, preservative-free sodium chloride.<sup>2899 2900</sup> The drug is also compatible with cerebrospinal fluid.<sup>2899 2900</sup>

### Implantable Pumps

Baclofen 0.5 mg/mL was filled into an implantable pump (Fresenius model VIP 30) and associated capillary tubing and stored at 37°C. No baclofen loss and no contamination from components of pump materials occurred during eight weeks of storage.<sup>1903</sup>

## Bendamustine Hydrochloride

### AHFS 10:00

#### Products

Bendamustine hydrochloride is available in several formulations that may differ in stability, incompatibilities, and directions for dilution and administration.<sup>2994 3098 3456</sup>

Bendamustine hydrochloride (Treanda) is available as a lyophilized powder in single-dose vials containing 25 or 100 mg of bendamustine hydrochloride and 42.5 or 170 mg of mannitol, respectively.<sup>2994</sup> The vials should be reconstituted only with sterile water for injection (5 or 20 mL, respectively) and shaken well to dissolve.<sup>2994</sup> The powder should completely dissolve within 5 minutes to yield a reconstituted solution with a bendamustine hydrochloride concentration of 5 mg/mL.<sup>2994</sup> If particulate matter is present, the reconstituted solution should be discarded.<sup>2994</sup> The reconstituted solution must be further diluted prior to administration.<sup>2994</sup> Within 30 minutes of reconstitution, the appropriate volume of the reconstituted solution should be withdrawn from the vial and immediately diluted in an infusion bag containing 500 mL of sodium chloride 0.9% or dextrose 2.5% in sodium chloride 0.45% prior to administration.<sup>2994</sup> The contents of the infusion bag should be thoroughly mixed following transfer of the reconstituted solution.<sup>2994</sup> The resulting concentration of bendamustine hydrochloride diluted in the infusion bag should be within the range of 0.2 to 0.6 mg/mL.<sup>2994</sup>

Bendamustine hydrochloride (Bendeka) is available as a 25 mg/mL ready-to-dilute concentrate for injection in 4-mL multidose vials containing 100 mg of bendamustine hydrochloride.<sup>3098</sup> Each mL of solution also contains propylene glycol 0.1 mL and monothioglycerol 5 mg in polyethylene glycol 400.<sup>3098</sup> Sodium hydroxide also may have been added to adjust the pH.<sup>3098</sup> Although the multidose vials do not contain any antimicrobial preservative, the drug is bacteriostatic.<sup>3098</sup> Bendamustine hydrochloride concentrate for injection must be diluted prior to infusion.<sup>3098</sup> Vials should be stored under refrigeration at 2 to 8°C; however, under such storage conditions, the contents of the vials may partially freeze.<sup>3098</sup> Vials should be allowed to reach room temperature prior to preparation of the infusion.<sup>3098</sup> If particulate matter is observed once the vial has warmed to room temperature, the vial should not be used.<sup>3098</sup> The appropriate volume of the solution should be withdrawn from the vial and immediately diluted in an infusion bag containing 50 mL of sodium chloride 0.9%, dextrose 2.5% in sodium chloride 0.45%, or dextrose 5%, and the contents of the infusion bag should be thoroughly mixed.<sup>3098</sup> The resulting concentration of bendamustine hydrochloride in the infusion bag should be within the range of 1.85 to 5.6 mg/mL.<sup>3098</sup>

Bendamustine hydrochloride (Eagle) is available as a 25-mg/mL ready-to-dilute concentrate for injection in 4-mL multidose vials containing 100 mg of bendamustine hydrochloride.<sup>3456</sup> Each mL of solution also contains propylene glycol 0.1 mL

and monothioglycerol 5 mg in polyethylene glycol 400.<sup>3456</sup> Although the multidose vials do not contain any antimicrobial preservative, the drug is bacteriostatic.<sup>3456</sup> Bendamustine hydrochloride concentrate for injection must be diluted prior to infusion.<sup>3456</sup> Vials should be stored under refrigeration at 2 to 8°C; however, under such storage conditions, the contents of the vials may partially freeze.<sup>3456</sup> Vials should be allowed to reach room temperature prior to preparation of the infusion.<sup>3456</sup> If particulate matter is observed once the vial has warmed to room temperature, the vial should not be used.<sup>3456</sup> The appropriate volume of the solution should be withdrawn from the vial and immediately diluted in an infusion bag containing 500 mL of sodium chloride 0.9% or dextrose 2.5% in sodium chloride 0.45%, and the contents of the infusion bag should be thoroughly mixed.<sup>3456</sup> The resulting concentration of bendamustine hydrochloride in the infusion bag should be within the range of 0.2 to 0.7 mg/mL.<sup>3456</sup>

#### pH

The solution reconstituted from the lyophilized powder has a pH of 2.5 to 3.5.<sup>2994</sup>

#### Trade Name(s)

Bendeka, Treanda

#### Administration

Bendamustine hydrochloride is administered by intravenous infusion after dilution of the appropriate volume of the reconstituted solution or concentrate for injection in a compatible diluent;<sup>2994 3098 3456</sup> specific product labeling should be consulted for additional administration details.

Care should be taken to ensure good venous access prior to starting the infusion, and the infusion site should be monitored during and after the infusion;<sup>2994 3098 3456</sup> extravasation should be avoided.<sup>2994 3098 3456</sup>

As with other cytotoxic drugs, bendamustine hydrochloride should be prepared and administered using protective measures to avoid inadvertent contact with the drug in the case of breakage of the vial or other accidental spillage.<sup>2994 2996 3098 3456</sup> Hands should be washed both before and after handling the drug.<sup>2996</sup> Gloves and protective clothing (e.g., laboratory coat, eye protection) are recommended in the preparation of the drug.<sup>2994 2996 3456</sup> Gloves that come in contact with bendamustine hydrochloride concentrate prior to dilution should be removed and properly disposed of.<sup>2994 3456</sup> If skin contact with the drug occurs, the exposed area should be washed thoroughly with soap and water.<sup>2994 3098 3456</sup> For mucous membrane contact, the exposed area should be flushed thoroughly with water.<sup>2994 3098 3456</sup> Applicable disposal procedures for the drug should be followed.<sup>2994 3098 3456</sup>

## Stability

Bendamustine hydrochloride lyophilized powder for injection (Treanda) is a white to off-white powder that forms a clear, colorless to pale yellow solution when reconstituted as directed with sterile water for injection.<sup>2994</sup> Intact vials of the lyophilized powder should be stored at controlled room temperature in the original package to protect from light.<sup>2994</sup> Short excursions not exceeding 2 days at –20 to 40°C are permitted for the intact 100-mg vials of lyophilized powder when stored in the original unopened carton.<sup>2996</sup> The reconstituted solution must be diluted within 30 minutes of reconstitution.<sup>2994</sup> Syringes containing the reconstituted solution and subsequently prepared infusions bags should be visually inspected to ensure the absence of particulate matter prior to administration.<sup>2994</sup> After dilution in sodium chloride 0.9% or dextrose 2.5% in sodium chloride 0.45%, the solution should be clear and colorless to slightly yellow in color.<sup>2994</sup>

Bendamustine hydrochloride concentrates for injection are clear, colorless to yellow solutions.<sup>3098 3456</sup> Intact vials of the concentrates for injection should be stored at 2 to 8°C in the original carton to protect from light.<sup>3098 3456</sup> When refrigerated, the contents of the vials may partially freeze.<sup>3098 3456</sup> Vials should be allowed to come to room temperature (15 to 30°C) prior to use.<sup>3098 3456</sup> Multidose vials do not contain any antimicrobial preservative, but the drug is bacteriostatic.<sup>3098 3456</sup> Partially used multidose vials may be stored for up to 28 days at 2 to 8°C in their

original carton following initial puncture.<sup>3098 3456</sup> Vials should be discarded 28 days after initial entry and should not be used for more than a total of 6 withdrawals.<sup>3098 3456</sup> Vials and subsequently prepared infusion bags should be visually inspected to ensure the absence of particulate matter prior to administration.<sup>3098 3456</sup> After dilution in a compatible diluent, the solution should remain clear and colorless to yellow or slightly yellow.<sup>3098 3456</sup>

The manufacturers state that admixtures of bendamustine hydrochloride should be prepared (from any of the formulations) as close to the time of administration as possible.<sup>2994 3098 3456</sup>

### Incompatibilities with Devices Containing Polycarbonate or Acrylonitrile-butadiene-styrene

Some previous formulations of bendamustine hydrochloride contained *N,N*-dimethylacetamide (DMA), which is incompatible with polycarbonate or acrylonitrile-butadiene-styrene (ABS) and devices containing these compounds (e.g., many closed-system transfer devices [CSTDs], adapters, syringes).<sup>2994 2995 2997 3044 3045</sup> Such devices had been shown to dissolve upon contact with DMA, leading to device failure (e.g., leaking, breaking or operational failure of CSTD components), potential contamination of the drug, and potential serious adverse effects in the patient (e.g., risk of small vessel blockage) or for the practitioner who prepared and/or administered the drug (e.g., skin reactions).<sup>2994 2995 2997 3044 3045</sup> Current commercially available formulations of bendamustine hydrochloride no longer contain DMA.<sup>2994 3098 3456</sup>

## Benztropine Mesylate

AHFS 28:36.08

### Products

Benztropine mesylate is available in 2-mL ampuls containing 2 mg of drug with sodium chloride in water for injection.<sup>1(9/05)</sup>

### pH

From 5 to 8.<sup>4</sup>

### Trade Name(s)

Cogentin

### Administration

Benztropine mesylate may be administered by intramuscular or, rarely, intravenous injection.<sup>1(9/05)</sup><sup>4</sup>

### Stability

Store the ampuls at controlled room temperature. Avoid freezing and storing at temperatures over 40°C.<sup>4</sup>

## Bevacizumab

### AHFS 10:00

#### Products

Bevacizumab is available as a 25-mg/mL injection solution in 4- and 16-mL single-dose (preservative-free) vials.<sup>1370</sup> Each mL also contains  $\alpha,\alpha$ -trehalose dihydrate 60 mg, sodium phosphate monobasic monohydrate 5.8 mg, sodium phosphate dibasic anhydrous 1.2 mg, and polysorbate 20 0.4 mg in water for injection.<sup>1370</sup>

Bevacizumab injection solution should be visually inspected for particulate matter and discoloration prior to administration; if the solution is discolored or cloudy or if particulate matter is present, the vial should be discarded.<sup>1370</sup> The appropriate volume of the drug should be withdrawn from the vial and diluted in 100 mL of sodium chloride 0.9%.<sup>1370</sup>

#### pH

Bevacizumab injection has a pH of 6.2.<sup>1370</sup>

#### Trade Name(s)

Avastin

#### Administration

Bevacizumab is administered by intravenous infusion following dilution of the appropriate dose in 100 mL of sodium chloride 0.9%.<sup>1370</sup> The manufacturer recommends that the first infusion be administered over 90 minutes.<sup>1370</sup> Administration time of the second infusion may be reduced to 60 minutes if the 90-minute infusion was tolerated; administration time of subsequent infusions may be further reduced to 30 minutes if the 60-minute infusion was tolerated.<sup>1370</sup>

Bevacizumab must *not* be diluted in or administered with dextrose-containing solutions.<sup>1370</sup>

Bevacizumab also has been administered by intravitreal injection;<sup>1372 1797 2117 2167 2237 2456 2457</sup> this method of administration is not included in the manufacturer's prescribing information.<sup>1370</sup>

#### Stability

Bevacizumab injection is a clear to slightly opalescent, colorless to pale brown solution.<sup>1370</sup> Intact vials should be stored at 2 to 8°C in the original carton until time of use to protect from light.<sup>1370</sup> Vials or cartons of the drug should not be frozen or shaken.<sup>1370</sup> The manufacturer states that any unused portions should be discarded.<sup>1370</sup>

The diluted solution in sodium chloride 0.9% may be stored for up to 8 hours at 2 to 8°C.<sup>1370</sup> Bevacizumab must *not* be diluted in or administered with dextrose-containing solutions.<sup>1370</sup>

When bevacizumab has been administered by intravitreal injection, only small amounts of the injection have been withdrawn from a vial; stability and sterility of the remaining drug has been assessed.<sup>1372 1797 2117</sup>

Bevacizumab (Genentech) injection solution remaining in previously punctured vials was stored at 4°C for up to 6 months.<sup>1372</sup> An immunoassay was used to determine the drug's ability to bind vascular endothelial growth factor (VEGF)-165, and the concentration of bevacizumab was calculated by correlating the amount of bound bevacizumab to a standard curve.<sup>1372</sup> In 3 months, 9.6% degradation occurred; maximum degradation of 12.7% occurred in 6 months.<sup>1372</sup>

Bevacizumab injection solution remaining in vials that were previously punctured for clinical use (i.e., punctured 4 to 5 times during the first month) was stored at 4°C and sampled thereafter at 1, 3, and 6 months.<sup>1797</sup> Stability of bevacizumab was assessed by matrix-assisted laser desorption ionization/time-of-flight (MALDI-TOF) mass spectrometry (MS), and the authors concluded from these results that most of the molecular structure of bevacizumab did not degrade within 6 months.<sup>1797</sup> Activity of bevacizumab was assessed by the amount of residual active VEGF measured in the in vitro mixture of bevacizumab and VEGF-165 and was expressed as the percentage of VEGF-165 consumed; activity of bevacizumab was noted to be 94.5, 94, and 91.6% at 1, 3, and 6 months, respectively, relative to that of bevacizumab at 0 months.<sup>1797</sup> No bacterial or fungal growth was detected in any sample at any time throughout the study.<sup>1797</sup>

Bevacizumab (Hoffmann-La Roche) injection solution remaining in vials following the withdrawal of multiple 1.25-mg doses for multiple patients (average of 11 punctures for a single vial on a single day within 4 hours' time) was stored at 4°C for up to 6 months.<sup>2117</sup> Based on the results of reverse-phase high-performance liquid chromatography (RP-HPLC), the authors suggested that bevacizumab did not undergo degradation over the 6-month study period.<sup>2117</sup> Similarly, the authors suggested that bevacizumab is stable in structure and conformation over the 6-month period based on the results of circular dichroism spectroscopy and fluorescence measurements.<sup>2117</sup> While all samples tested negative for bacterial and fungal growth at 7 days, sterility was not evaluated over the entire 6-month period.<sup>2117</sup>

#### Freezing Solutions

The manufacturer states that bevacizumab injection solution should not be frozen.<sup>1370</sup>

Bevacizumab (Genentech) injection solution was packaged in 1-mL tuberculin syringes (Becton Dickinson) capped with a 30-gauge needle (Becton Dickinson) and stored at -10°C for 6 months.<sup>1372</sup> An immunoassay was used to determine the drug's ability to bind VEGF-165, and the concentration of bevacizumab was calculated by correlating the amount of bound bevacizumab to a standard curve.<sup>1372</sup> In 6 months, 12% degradation occurred.<sup>1372</sup>

Packaging of bevacizumab into syringes causes increases in particle concentrations, mostly due to the presence of silicone oil microdroplets.<sup>2167</sup> Freezing of bevacizumab injection solution and placebo (a solution closely resembling the vehicle of bevacizumab injection)<sup>1370</sup> in syringes at  $-20^{\circ}\text{C}$  caused immediate increases in particle concentrations to greater than 1.2 million particles per mL; by comparison, the mean particle concentration in bevacizumab withdrawn directly from the original glass vials was about 64,000 particles per mL.<sup>2167</sup> While particle concentrations in bevacizumab syringes incubated at  $-20^{\circ}\text{C}$  subsequently remained constant, particle concentrations in placebo syringes increased up to 6 million particles per mL over the 12-week study period.<sup>2167</sup> Repeated freeze-thaw cycles (e.g., 5 or 10 cycles) caused increased particle concentrations and greater than 10% bevacizumab monomer loss.<sup>2167</sup> Bevacizumab packaged as 0.05 mL in 1-mL tuberculin syringes (Becton Dickinson) and stored at  $-20^{\circ}\text{C}$  demonstrated substantially lower particle counts (particularly for particles in the larger size range of 2 to 10  $\mu\text{m}$ ) than bevacizumab packaged as 0.05 mL in 0.3-mL plastic insulin syringes (Becton Dickinson).<sup>2167</sup>

### Syringes

Bevacizumab (Genentech) injection solution was packaged in 1-mL tuberculin syringes (Becton Dickinson) capped with a 30-gauge needle (Becton Dickinson) and stored at  $4^{\circ}\text{C}$  for up to 6 months.<sup>1372</sup> An immunoassay was used to determine the drug's ability to bind VEGF-165, and the concentration of bevacizumab was calculated by correlating the amount of bound bevacizumab to a standard curve.<sup>1372</sup> In 3 months, 8.8% degradation occurred; maximum degradation of 15.9% occurred in 6 months.<sup>1372</sup>

Packaging of bevacizumab into syringes causes increases in particle concentrations, mostly due to the presence of silicone oil microdroplets.<sup>2167</sup> Bevacizumab injection solution was packaged as 0.05 mL in 0.3-mL plastic insulin syringes (Becton Dickinson) and stored at room temperature with or without exposure to fluorescent light and at  $4^{\circ}\text{C}$ .<sup>2167</sup> Mean baseline particle concentration in bevacizumab syringes was 283,675 particles per mL compared with a mean particle concentration in the range of 20,000 to 60,000 particles per mL in bevacizumab withdrawn directly from the original glass vial.<sup>2167</sup> Particle concentrations and particle size distribution remained relatively unchanged during 12 weeks of storage at  $4^{\circ}\text{C}$ .<sup>2167</sup> During the 12-week period, particle concentrations generally were slightly greater in syringes stored at room temperature than those stored at  $4^{\circ}\text{C}$ .<sup>2167</sup> Within 1 week, syringes stored at room temperature with light exposure developed clogged needles.<sup>2167</sup> Particle concentrations generally increased more in syringes stored at room temperature *with* light exposure compared with those stored at room temperature *without* light exposure over the 12-week period.<sup>2167</sup>

Bevacizumab (Roche) 25-mg/mL injection solution was packaged as 0.15 mL in 1-mL polypropylene tuberculin syringes (Becton Dickinson) with a 22-gauge capped needle attached and stored at  $4^{\circ}\text{C}$  for 3 months.<sup>2237</sup> A variety of techniques were used to assess the primary, secondary, and tertiary structure of bevacizumab, including cation exchange chromatography, size-exclusion chromatography, peptide mapping, second derivative ultraviolet (UV) and infrared (IR) spectroscopy, turbidimetry, diffraction laser spectroscopy, thermal denaturation curves, and microscopic examination and subsequent image analysis.<sup>2237</sup> The authors concluded that bevacizumab could be repackaged into polypropylene syringes and stored for up to 3 months at  $4^{\circ}\text{C}$  without changes to the primary, secondary, or tertiary structure of the drug.<sup>2237</sup> Silicone oil microdroplets were noted immediately upon repackaging of the drug into syringes and remained relatively constant in both number and size throughout the storage period.<sup>2237</sup>

Bevacizumab (Roche) 25-mg/mL injection solution was packaged as 1 mL in 1-mL tuberculin syringes (Henke-Sass Wolf) with syringe caps (Braun) and stored at  $4^{\circ}\text{C}$  for up to 54 days.<sup>2456</sup> Bevacizumab concentration (measured using only an HPLC method) and pH remained stable over 32 days.<sup>2456</sup> Another HPLC method used to screen for the presence of leachables did not show any additional peaks as compared with baseline.<sup>2456</sup> The number of particles increased during storage and exceeded USP limits by 7 days.<sup>2456</sup> The authors suggested that the particles could be silicone oil microdroplets from the syringes or bevacizumab protein aggregates.<sup>2456</sup> While the presence of subvisible particles in intravitreal injections is not tolerated by USP standards, the clinical relevance of such particles in intravitreal injections has not been extensively studied and remains unknown.<sup>2456</sup> Based on the results of the particle analysis, the authors concluded that storage of bevacizumab in such syringes should not exceed 3 days.<sup>2456</sup>

Bevacizumab (Genentech) 25-mg/mL injection solution was packaged as 0.13 mL in 1-mL polycarbonate (Braun) and polypropylene (Becton Dickinson) syringes and stored at 2 to  $8^{\circ}\text{C}$ .<sup>2457</sup> Physical stability of bevacizumab was assessed using a variety of techniques, including gel electrophoresis, size-exclusion chromatography, dynamic light scattering, and surface plasmon resonance.<sup>2457</sup> The authors concluded that no discernible changes in the physical stability of bevacizumab or its ability to bind VEGF were noted for up to 6 months as compared with bevacizumab injection solution from a freshly opened vial.<sup>2457</sup>

### Sorption

Incompatibilities between bevacizumab injection solution and polyvinyl chloride (PVC) or polyolefin bags have not been observed.<sup>1370</sup>

## Compatibility Information

## Bivalirudin

### AHFS 20:12.04.12

### Products

Bivalirudin is available as a white lyophilized powder or cake.<sup>3287</sup> Each single-dose vial contains bivalirudin 250 mg with mannitol 125 mg and sodium hydroxide to adjust the pH.<sup>3287</sup> Vials should be reconstituted with 5 mL of sterile water for injection and swirled to dissolve, yielding a 50-mg/mL solution.<sup>3287</sup> The reconstituted solution should be further diluted to a concentration of 0.5 or 5 mg/mL prior to administration.<sup>3287</sup>

Bivalirudin also is available as a lyophilized powder or cake in 250-mg single-use ADD-Vantage vials.<sup>3308</sup> Each ADD-Vantage vial also contains mannitol 125 mg and sodium hydroxide to adjust the pH.<sup>3308</sup> ADD-Vantage vials of bivalirudin should be prepared with 50 mL of dextrose 5% or sodium chloride 0.9% in ADD-Vantage diluent bags to yield a solution with a final concentration of 5 mg/mL.<sup>3308</sup>

### pH

From 5 to 6.<sup>3287 3308</sup>

### Sodium Content

Approximately 12.5 mg per vial.<sup>3287 3308</sup>

### Trade Name(s)

Angiomax

### Administration

Bivalirudin is administered by direct intravenous injection<sup>3287</sup> and continuous infusion.<sup>3287 3308</sup>

### Stability

Bivalirudin vials should be stored at controlled room temperature.<sup>3287 3308</sup> The drug is a white lyophilized powder that forms a clear to slightly opalescent, colorless to slightly yellow solution upon reconstitution.<sup>3287 3308</sup> The reconstituted solution prepared from single-dose vials is stable for 24 hours at 2 to 8°C.<sup>3287</sup> Freezing of reconstituted and diluted solutions should be avoided.<sup>3287 3308</sup> Unused portions should be discarded.<sup>3287</sup>

<sup>a</sup> Tested in dextrose 5%.

<sup>b</sup> Tested in sodium chloride 0.9%.

<sup>c</sup> Test performed using the formulation WITHOUT edetate disodium.

<sup>d</sup> NOTE: Undiluted dobutamine hydrochloride concentrate must be diluted for administration. This concentration is not acceptable for intravenous administration.

<sup>e</sup> Ampicillin component. Ampicillin in a 2:1 fixed-ratio concentration with sulbactam.

<sup>f</sup> Piperacillin component. Piperacillin in an 8:1 fixed-ratio concentration with tazobactam.

<sup>g</sup> Trimethoprim component. Trimethoprim in a 1:5 fixed-ratio concentration with sulfamethoxazole.

<sup>h</sup> Test performed using the Flolan formulation.

## Bleomycin Sulfate

### AHFS 10:00

#### Products

Bleomycin sulfate is available in vials containing 15 and 30 units of bleomycin as the sulfate.<sup>2936 2937</sup> Sulfuric acid or sodium hydroxide may have been added to some products to adjust the pH.<sup>2937</sup>

For intramuscular or subcutaneous administration, reconstitute the 15-unit vial with 1 to 5 mL and the 30-unit vial with 2 to 10 mL of sterile water for injection, sodium chloride 0.9%, or bacteriostatic water for injection.<sup>2936 2937</sup> For intravenous injection, reconstitute the 15-unit or 30-unit vial with 5 or 10 mL, respectively, of sodium chloride 0.9%.<sup>2936 2937</sup> For intrapleural administration, dissolve 60 units in 50 to 100 mL of sodium chloride 0.9%.<sup>2936 2937</sup> The manufacturers state that dextrose-containing diluents should not be used for the reconstitution or dilution of bleomycin sulfate; analysis has revealed a loss in drug potency that occurs with the use of dextrose 5% that does not occur with the use of sodium chloride 0.9%.<sup>2936 2937</sup>

#### Units

Bleomycin sulfate is a mixture of cytotoxic glycopeptide antibiotics.<sup>2936 2937</sup> In the United States, a unit of bleomycin is equal to the term milligram activity, which was formerly used.<sup>2936 2937</sup> One unit of bleomycin is equivalent in activity to 1 mg of bleomycin A<sub>2</sub> reference standard.<sup>4</sup>

#### Administration

Bleomycin sulfate may be administered by intramuscular, subcutaneous, or intravenous injection, or by intrapleural

instillation through a thoracostomy tube.<sup>2936 2937</sup> Intravenous injections should be given slowly over a 10-minute period.<sup>2936 2937</sup>

#### Stability

Intact vials are stable under refrigeration.<sup>2936 2937</sup> They also have been stated to be stable for 28 days at room temperature.<sup>1181 1433</sup>

The manufacturers state that bleomycin in sodium chloride is stable for 24 hours at room temperature.<sup>2936 2937</sup> Bleomycin sulfate solutions reconstituted with sodium chloride 0.9% also have been reported to be stable for 4 weeks when stored at 2 to 8°C,<sup>4 1369</sup> for 2 weeks<sup>4</sup> to 4 weeks (protected from light)<sup>1369</sup> at room temperature, and for 10 days at 37°C.<sup>1073</sup>

Ogawa et al. reported that immersion of a needle with an aluminum component in bleomycin sulfate (Bristol) 3 units/mL resulted in no visually apparent reaction after 7 days at 24°C.<sup>988</sup>

In the event of spills or leaks, the use of sodium hypochlorite 5% (household bleach) or potassium permanganate 1% has been recommended to inactivate bleomycin sulfate.<sup>1200</sup>

#### pH Effects

Bleomycin sulfate (Bristol) is stable in solution over a pH range of 4 to 10.<sup>763</sup>

#### Filtration

Bleomycin sulfate was shown not to exhibit substantial sorption to cellulose ester (Ivex-2), cellulose nitrate/cellulose acetate (Millex OR), nylon, or Teflon (Millex FG) filters.<sup>533 1415 1416 1577</sup>

## Blinatumomab

### AHFS 10:00

#### Products

Blinatumomab is available as a lyophilized powder in preservative-free single-dose vials containing 35 mcg of the drug.<sup>3095</sup> Each vial also contains citric acid monohydrate 3.35 mg, lysine hydrochloride 23.23 mg, polysorbate 80 0.64 mg, trehalose dihydrate 95.5 mg, and sodium hydroxide to adjust the pH.<sup>3095</sup>

Each vial of blinatumomab is packaged with a 10-mL single-dose vial of preservative-free intravenous solution stabilizer.<sup>3095</sup> Each vial of intravenous solution stabilizer contains citric acid monohydrate 52.5 mg, lysine hydrochloride 2283.8 mg, polysorbate 80 10 mg, sodium hydroxide (to adjust the pH), and water for injection.<sup>3095</sup> The intravenous solution stabilizer is added to the infusion bag to coat the bag prior to the addition of the reconstituted blinatumomab solution, thereby preventing adhesion of the drug to the bag and administration tubing; *the solution stabilizer should not be used to reconstitute the drug.*<sup>3095</sup>

The manufacturer states that protective clothing and gloves should be worn in the preparation of blinatumomab.<sup>3095</sup> Gloves and surfaces that may have come in contact with the drug during preparation should be disinfected.<sup>3095</sup>

*Because errors have occurred in the preparation of blinatumomab, the manufacturer's instructions for preparation of the drug should be strictly followed to minimize the risk of such errors.*<sup>3095</sup>

To reconstitute a vial of blinatumomab, 3 mL of preservative-free sterile water for injection should be added to the vial containing 35 mcg of the drug.<sup>3095</sup> The stream of diluent should be directed along the walls of the vial (not directly into the lyophilized powder), and the vial should be gently swirled to avoid excess foaming.<sup>3095</sup> The vial should not be shaken.<sup>3095</sup> The concentration of blinatumomab in the reconstituted solution is 12.5 mcg/mL; this solution must be further diluted prior to administration.<sup>3095</sup> The reconstituted solution should be clear to slightly opalescent, colorless to slightly yellow.<sup>3095</sup> Reconstituted blinatumomab solution should be visually inspected for particulate matter and discoloration; the solution should not be used if it is cloudy or has precipitated.<sup>3095</sup>

To prepare a blinatumomab solution for infusion for administration over 24 or 48 hours at a rate of 10 or 5 mL/hr, respectively, 270 mL of sodium chloride 0.9% injection should be transferred to an empty polyolefin, diethylhexyl phthalate (DEHP)-free polyvinyl chloride (PVC), or ethyl vinyl acetate (EVA) infusion bag followed by 5.5 mL of intravenous solution stabilizer.<sup>3095</sup> The contents of the infusion bag should be mixed gently to avoid foaming.<sup>3095</sup> The remaining unused portion of intravenous solution stabilizer should be discarded.<sup>3095</sup> The appropriate amount of reconstituted blinatumomab solution should then be transferred to the infusion bag containing the sodium chloride 0.9% and intravenous solution stabilizer, and the contents of the infusion bag again should be mixed gently to avoid foaming.<sup>3095</sup>

Alternatively, diluted blinatumomab solution for infusion may be administered over 7 days in patients weighing at least 22 kg; this option is not recommended for use in patients weighing less than 22 kg.<sup>3095</sup> To prepare a blinatumomab solution for infusion for administration over 7 days at a rate of 0.6 mL/hr, 90 mL of bacteriostatic sodium chloride 0.9% preserved with benzyl alcohol should be transferred to an empty polyolefin, DEHP-free PVC, or EVA infusion bag followed by 2.2 mL of intravenous solution stabilizer.<sup>3095</sup> The contents of the infusion bag should be mixed gently to avoid foaming.<sup>3095</sup> The remaining unused portion of intravenous solution stabilizer should be discarded.<sup>3095</sup> The appropriate amount of reconstituted blinatumomab solution should then be transferred to the infusion bag containing bacteriostatic sodium chloride 0.9% and intravenous solution stabilizer, and the contents of the infusion bag again should be mixed gently to avoid foaming.<sup>3095</sup> A sufficient amount of sodium chloride 0.9% should be added to the infusion bag to yield a total volume of 110 mL resulting in a final benzyl alcohol concentration of 0.74%.<sup>3095</sup> The contents of the infusion bag again should be mixed gently to avoid foaming.<sup>3095</sup>

When prepared according to the manufacturer's directions for administration over 24 hours, 48 hours, or 7 days, the blinatumomab infusion solution will have a greater volume than will be administered to the patient to allow for priming of the line and to ensure that the patient receives the full dose of the drug.<sup>3095</sup> Intravenous tubing that is composed of polyolefin, DEHP-free PVC, or EVA and is compatible with the infusion pump used should be attached to the bag containing the diluted blinatumomab solution for infusion.<sup>3095</sup> Intravenous tubing used for the administration of a 24- or 48-hour infusion of blinatumomab must contain a low protein-binding 0.2- $\mu$ m inline filter; intravenous tubing used for the administration of a 7-day infusion does not require an inline filter.<sup>3095</sup> Air should be removed from the infusion bag; removal of air from the bag is especially important for use with ambulatory infusion pumps.<sup>3095</sup> The attached intravenous tubing should be primed *only* with the prepared blinatumomab solution for infusion; the tubing should *not* be primed with sodium chloride 0.9%.<sup>3095</sup>

#### Trade Name(s)

Blinicyto

#### Administration

Blinatumomab diluted for infusion is administered by continuous infusion, either over 24 or 48 hours at a rate of 10 or 5 mL/hr, respectively, or over 7 days at a rate of 0.6 mL/hr in patients weighing at least 22 kg.<sup>3095</sup> The diluted solution for infusion should be administered at a constant rate using a programmable, lockable, non-elastomeric infusion pump equipped with an alarm.<sup>3095</sup> Patients should receive appropriate premedication administered prior to blinatumomab infusion when indicated.<sup>3095</sup>

Because errors have occurred during administration of blinatumomab, the manufacturer's instructions for administration of the drug should be strictly followed to minimize the risk of such errors.<sup>3095</sup> The intravenous tubing should be primed *only* with the prepared blinatumomab solution for infusion; the tubing should *not* be primed with sodium chloride 0.9%.<sup>3095</sup> If a multi-lumen venous catheter is used for administration, the diluted solution of blinatumomab for infusion should be infused through a dedicated lumen.<sup>3095</sup> The infusion line or intravenous catheter through which blinatumomab is administered *must not* be flushed, especially when changing infusion bags.<sup>3095</sup> Flushing the line can result in the administration of an excess dose with resulting potential complications.<sup>3095</sup> Instead, any unused solution for infusion remaining in the infusion bag or line should be disposed of properly.<sup>3095</sup>

## Stability

Blinatumomab is a white to off-white lyophilized powder that forms a clear to slightly opalescent, colorless to slightly yellow solution upon reconstitution.<sup>3095</sup> Intact vials of blinatumomab and intravenous solution stabilizer should be stored at 2 to 8°C in the original package to protect from light until the time of use.<sup>3095</sup> Vials of both blinatumomab lyophilized powder and intravenous solution stabilizer may be stored for a maximum of 8 hours at room temperature in the original carton to protect from light.<sup>3095</sup> Vials should not be frozen.<sup>3095</sup>

After reconstitution, a vial of blinatumomab may be stored for a maximum of 24 hours at 2 to 8°C or 4 hours at 23 to 27°C.<sup>3095</sup>

If not used immediately, final diluted solutions of blinatumomab for infusion should be stored at 2 to 8°C.<sup>3095</sup> The diluted

solution intended for infusion over 24 or 48 hours and prepared with sodium chloride 0.9% may be stored for a maximum of 8 days at 2 to 8°C; if stored at 23 to 27°C, administration of these diluted solutions of blinatumomab must be completed within 48 hours.<sup>3095</sup> The diluted solution of blinatumomab intended for infusion over 7 days and prepared with bacteriostatic sodium chloride 0.9% (preserved with benzyl alcohol) may be stored for a maximum of 14 days at 2 to 8°C; if stored at 23 to 27°C, administration of this diluted solution of blinatumomab must be completed within 7 days.<sup>3095</sup>

## Sorption

Intravenous solution stabilizer packaged with blinatumomab is added to the infusion bag to coat the bag prior to the addition of the reconstituted blinatumomab solution, thereby preventing adhesion of the drug to the bag and administration tubing.<sup>3095</sup> Only polyolefin, DEHP-free PVC, and EVA infusion bags, pump cassettes, and intravenous tubing should be used in the preparation and administration of blinatumomab.<sup>3095</sup>

## Filtration

Blinatumomab solution for infusion must be administered through polyolefin, DEHP-free PVC, or EVA intravenous tubing.<sup>3095</sup> The final diluted solution of blinatumomab intended for infusion over 24 or 48 hours and prepared with sodium chloride 0.9% must be administered through intravenous tubing containing a low protein-binding 0.2-µm inline filter.<sup>3095</sup> An inline filter is *not* required for the administration of a 7-day infusion bag prepared with bacteriostatic sodium chloride 0.9% (preserved with benzyl alcohol).<sup>3095</sup>

## Bortezomib

### AHFS 10:00

#### Products

Bortezomib is available as a lyophilized powder in single-use (unpreserved) vials containing 3.5 mg of drug with mannitol 35 mg.<sup>2897</sup>

For intravenous bolus injection, reconstitute vials with 3.5 mL of sodium chloride 0.9% to yield a solution containing 1 mg/mL.<sup>2897</sup> For subcutaneous administration, reconstitute vials with 1.4 mL of sodium chloride 0.9% to yield a solution containing 2.5 mg/mL.<sup>2897</sup> If subcutaneous injection results in local injection site reactions, the 1-mg/mL solution also may be administered subcutaneously.<sup>2897</sup>

#### Trade Name(s)

Velcade

#### Administration

Bortezomib is administered by intravenous bolus injection over 3 to 5 seconds or by subcutaneous injection only.<sup>2897</sup> It should not be given by any other route.<sup>2897</sup> Because the inadvertent intrathecal administration of bortezomib has resulted in fatalities and administration by this route is contraindicated, the manufacturer has provided stickers with each vial of the drug to be affixed to the prepared syringe of bortezomib to indicate the intended correct route of administration.<sup>2897 2898</sup>

#### Stability

Intact vials should be stored at controlled room temperature and left in the original box to protect from light during storage.<sup>2897</sup> Bortezomib is a white to off-white lyophilized powder or cake that forms a clear, colorless solution when reconstituted with sodium chloride 0.9%.<sup>2897</sup>

The manufacturer states that bortezomib reconstituted as directed with sodium chloride 0.9% and stored at 25°C in the

original vial or in a syringe should be used within 8 hours of preparation.<sup>2897</sup> However, bortezomib (Janssen-Cilag) reconstituted with sodium chloride 0.9% to a concentration of 1 mg/mL in the original vials was reported to be stable for at least 5 days under refrigeration protected from light.<sup>2663</sup>

Bortezomib reconstituted with sodium chloride 0.9% to a concentration of 1 mg/mL was found to undergo little or no loss for 42 days stored at 23°C or refrigerated at 4°C.<sup>2768</sup>

Bortezomib (Janssen) reconstituted with sodium chloride 0.9% to a concentration of 2.5 mg/mL was found to undergo less than 5% loss in 21 days when stored in the original vial at 23°C in fluorescent light or under refrigeration at 4°C in the dark.<sup>2972</sup>

Bortezomib (Janssen-Cilag) 1 mg/mL in sodium chloride 0.9% did not result in the loss of viability of *Staphylococcus aureus* within 120 hours at room temperature. Diluted solutions should be stored under refrigeration whenever possible, and the potential for microbiological growth should be considered when assigning expiration periods.<sup>2740</sup>

#### Syringes

Bortezomib (Janssen-Cilag) 1 mg/mL in sodium chloride 0.9% was packaged in 5-mL polypropylene plastic syringes (Becton-Dickinson) and stored at room temperature exposed to neon light and under refrigeration in the dark. The drug solutions remained clear and colorless throughout the study at both temperatures. About 8 to 9% loss occurred in 5 days at room temperature and in 7 days refrigerated and protected from light.<sup>2663</sup>

Bortezomib (Janssen) 2.5 mg/mL in sodium chloride 0.9% was packaged in 3-mL polypropylene syringes and stored at 23°C in fluorescent light or under refrigeration at 4°C in the dark.<sup>2972</sup> Less than 5% loss occurred in 21 days in syringes stored at either temperature.<sup>2972</sup>

## Brexanolone

AHFS 28:16.04.92

### Products

Brexanolone is available as a 5-mg/mL concentrate for injection in 20-mL single-dose (preservative-free) vials.<sup>3461</sup> The concentrate must be diluted prior to administration.<sup>3461</sup> Each mL of solution also contains betadex sulfobutyl ether sodium 250 mg, citric acid monohydrate 0.265 mg, sodium citrate dihydrate 2.57 mg, and water for injection.<sup>3461</sup> Hydrochloric acid or sodium hydroxide may have been added during manufacturing to adjust the pH.<sup>3461</sup>

Brexanolone concentrate for injection must be diluted prior to administration.<sup>3461</sup> Administration of the 60-hour infusion generally requires the preparation and administration of at least 5 infusion bags; additional bags will be necessary when the drug is administered to patients weighing at least 90 kg.<sup>3461</sup> Vials of brexanolone should be visually inspected for particulate matter and discoloration prior to administration; vials should not be used if the solution is discolored or if particulate matter is present.<sup>3461</sup> To prepare each infusion bag, 20 mL of brexanolone concentrate for injection should be withdrawn from the vial and transferred to a non-diethylhexyl phthalate (non-DEHP) and non-latex polyolefin infusion bag.<sup>3461</sup> The concentrate should then be diluted by adding 40 mL of sterile water for injection to the infusion bag followed by 40 mL of sodium chloride 0.9% for a total volume of 100 mL and a target brexanolone concentration of 1 mg/mL.<sup>3461</sup>

### pH

The pH of admixtures with brexanolone (Sage) concentrations of 0.5 and 1.67 mg/mL ranges from 5.7 to 6.4.<sup>3462</sup>

### Tonicity

Brexanolone 5-mg/mL concentrate for injection is hypertonic.<sup>3461</sup>

### Osmolality

The measured osmolality of admixtures with brexanolone (Sage) concentrations of 0.5 and 1.67 mg/mL ranges from 243 to 286 mOsmol/kg.<sup>3462</sup>

### Trade Name(s)

Zulresso

### Administration

Brexanolone is administered as a continuous intravenous infusion over 60 hours following dilution as directed with sterile water for injection followed by sodium chloride 0.9%.<sup>3461</sup>

The diluted solution for infusion should be administered through a dedicated line using a programmable peristaltic infusion pump.<sup>3461</sup> The drug should be administered through a non-DEHP and non-latex polyvinyl chloride (PVC) infusion set; infusion sets with inline filters should *not* be used.<sup>3461</sup> Infusion sets should be fully primed with the diluted solution before inserting the set into the pump and connecting it to the venous catheter.<sup>3461</sup> The manufacturer states that other drugs should not be injected into the infusion bag or mixed with brexanolone.<sup>3461</sup>

The infusion should be initiated at a rate of 30 mcg/kg/hr for the first 4 hours.<sup>3461</sup> After the initial 4 hours, the infusion rate should be increased to 60 mcg/kg/hr for the next 20 hours and then increased further to 90 mcg/kg/hr for the following 28 hours.<sup>3461</sup> Alternatively, a reduction in the infusion rate back to 60 mcg/kg/hr may be considered during hours 24 to 52 for those who do not tolerate the recommended higher infusion rate.<sup>3461</sup> The infusion rate should be decreased to (or remain at) 60 mcg/kg/hr for hours 52 to 56, with a final reduction back to 30 mcg/kg/hr for the remaining 4 hours of the 60-hour infusion.<sup>3461</sup>

### Stability

Brexanolone concentrate for injection is a clear, colorless solution.<sup>3461</sup> Intact vials should be stored at 2 to 8°C and protected from light; vials should not be frozen.<sup>3461</sup>

Administration of diluted solutions of brexanolone for infusion prepared as directed using both sterile water for injection and sodium chloride 0.9% should be completed within 12 hours after dilution; if not used immediately after dilution, the diluted solution may be stored under refrigeration for up to 96 hours.<sup>3461</sup>

### Plasticizer Leaching

A non-DEHP and non-latex polyolefin infusion bag should be used to prepare diluted solutions of brexanolone for infusion.<sup>3461</sup>

A non-DEHP and non-latex PVC administration set should be used for administration of the diluted solution for infusion.<sup>3461</sup>

### Filtration

Infusion sets with inline filters should *not* be used in the administration of the diluted solution.<sup>3461</sup>

## Brivaracetam

AHFS 28:12.92

### Products

Brivaracetam is available as a 10-mg/mL solution in 5-mL single-dose (unpreserved) vials.<sup>3146</sup> Each vial also contains sodium acetate trihydrate, sodium chloride, water for injection, and glacial acetic acid to adjust the pH.<sup>3146</sup>

### pH

5.5.<sup>3146</sup>

### Trade Name(s)

Briviact

### Administration

Brivaracetam is administered intravenously over 2 to 15 minutes either undiluted or diluted in a compatible infusion solution.<sup>3146</sup> (See Solution Compatibility.)

### Stability

Brivaracetam is a clear and colorless solution.<sup>3146</sup> Intact vials should be stored at room temperature and should not be frozen.<sup>3146</sup> Any unused portion of the contents from a single-dose vial should be discarded.<sup>3146</sup> Solutions should be visually inspected for particulate matter prior to administration; if particulate matter is present or if discoloration occurs, the solution should not be used.<sup>3146</sup>

## Compatibility Information

## Bumetanide

AHFS 40:28.08

### Products

Bumetanide is available as a 0.25-mg/mL solution in 4-mL single-dose vials and 10-mL multidose vials.<sup>3288 3309</sup> The solution also contains sodium chloride 0.85%, ammonium acetate 0.4%, disodium edetate 0.01%, and benzyl alcohol 1% with sodium hydroxide to adjust the pH.<sup>3288 3309</sup>

### pH

Adjusted to approximately 7<sup>3288</sup> or 6.8 to 7.8.<sup>3309</sup>

### Administration

Bumetanide is administered by intramuscular injection,<sup>3288 3309</sup> direct intravenous injection over 1 to 2 minutes,<sup>3288 3309</sup> and by intravenous infusion.<sup>4</sup>

### Stability

Bumetanide discolors when exposed to light. The injection should be stored at controlled room temperature and protected

from light.<sup>3288 3309</sup> Bumetanide is reported to be stable at pH 4 to 10.<sup>4</sup> Precipitation may occur at pH values less than 4.<sup>1644</sup>

### Sorption

Substantial sorption to glass and PVC containers does not occur.<sup>3288 3309</sup>

### Central Venous Catheter

Bumetanide (Ohmeda) 0.04 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

<sup>a</sup> Tested in dextrose 5%.

<sup>b</sup> Tested in sodium chloride 0.9%.

<sup>c</sup> Tested in bacteriostatic sodium chloride 0.9% preserved with benzyl alcohol 0.9%.

<sup>d</sup> Lyophilized formulation tested.

<sup>e</sup> Refer to Appendix for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>f</sup> Test performed using the formulation WITHOUT edetate disodium.

<sup>g</sup> Tested in Ringer's injection, lactated.

<sup>h</sup> Piperacillin component. Piperacillin in an 8:1 fixed-ratio concentration with tazobactam.

<sup>i</sup> Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>j</sup> Ceftolozane component. Ceftolozane in a 2:1 fixed-ratio concentration with tazobactam.

<sup>k</sup> Meropenem component. Meropenem in a 1:1 fixed-ratio concentration with vaborbactam.

<sup>l</sup> Test performed using the formulation WITH edetate disodium.

# Bupivacaine Hydrochloride

**AHFS 72:00**

## Products

Bupivacaine hydrochloride is available in concentrations of 0.25, 0.5, and 0.75% (2.5, 5, and 7.5 mg/mL, respectively) in single-dose containers. The 0.25 and 0.5% concentrations also come in 50-mL multiple-dose vials with methylparaben 1 mg/mL as a preservative. Sodium hydroxide or hydrochloric acid is used to adjust the pH.<sup>1(11/06) 4</sup>

Bupivacaine hydrochloride is also available in concentrations of 0.25, 0.5, and 0.75% with epinephrine 1:200,000 as the bitartrate. In addition to bupivacaine hydrochloride, each mL contains epinephrine bitartrate 0.005 mg, sodium metabisulfite 0.5 mg, and disodium edetate 0.1 mg. Multiple-dose vials contain methylparaben 1 mg/mL as a preservative while single-dose containers are preservative free. Sodium hydroxide or hydrochloric acid is used to adjust the pH.<sup>1(11/06) 4</sup>

A hyperbaric solution of bupivacaine hydrochloride is available in 2-mL ampuls. Each mL contains bupivacaine hydrochloride 7.5 mg and dextrose 82.5 mg (8.25%) with sodium hydroxide or hydrochloric acid to adjust the pH.<sup>1(11/06) 4</sup>

## pH

Bupivacaine hydrochloride injection and the hyperbaric solution have a pH of 4 to 6.5. Bupivacaine hydrochloride with epinephrine 1:200,000 has a pH of 3.3 to 5.5.<sup>4</sup>

## Specific Gravity

The hyperbaric solution has a specific gravity of 1.030 to 1.035 at 25°C and 1.03 at 37°C.<sup>4</sup>

## Trade Name(s)

Marcaine, Sensorcaine, Sensorcaine-MPF

## Administration

Bupivacaine hydrochloride may be administered by infiltration or by epidural, spinal, or peripheral or sympathetic nerve block as a single injection or repeat injections. Injections should be made slowly, with frequent aspirations, to guard against intravascular injection. Products containing preservatives should not be used for epidural or caudal block.<sup>1(11/06) 4</sup>

## Stability

Bupivacaine hydrochloride injections should be stored at controlled room temperature; freezing should be avoided.<sup>1(11/06) 4</sup>

Products containing epinephrine should be protected from light during storage. Partially used containers that do not contain antibacterial preservatives should be discarded after entry.<sup>4</sup>

Bupivacaine hydrochloride without epinephrine and the hyperbaric solution may be autoclaved at 121°C and 15 psi for 15 minutes. Products containing epinephrine should not be autoclaved.<sup>1(11/06) 4</sup>

Bupivacaine hydrochloride with epinephrine should not be used if a pinkish color, a color darker than "slightly" yellow, or a precipitate develops.<sup>1(11/06) 4</sup>

## Syringes

The stability of bupivacaine (salt form unspecified) 5 mg/mL repackaged in polypropylene syringes was evaluated. Little or no change in concentration was found after four weeks of storage at room temperature not exposed to direct light.<sup>2164</sup>

Bupivacaine hydrochloride (Astra) 1 mg/mL in sodium chloride 0.9% was packaged in two types in polypropylene syringes. The Omnifix (B. Braun) syringes had polyisoprene piston tips while the Terumo syringes had no natural or synthetic rubber in the product. Stored at 4, 21, and 35°C for 30 days, the test solutions exhibited no visible or pH changes. Although the pH remained within the stability range for the drug, this does not demonstrate stability.<sup>2387</sup>

## Ambulatory Pumps

Bupivacaine hydrochloride (Astra) 7.5 mg/mL was filled into 50-mL ambulatory pump cassette reservoirs (Pharmacia Deltec) and stored at room temperature protected from light for 90 days. The drug concentration increased 12% during the observation period, possibly because of loss of water from the solutions.<sup>1850</sup>

## Implantable Pumps

Bupivacaine hydrochloride 7.5 mg/mL in dextrose 8.25% (Marcaine spinal) stability was evaluated in SynchroMed implantable pumps over 12 weeks at 37°C. Little or no loss of bupivacaine hydrochloride and no adverse effects on the pumps occurred.<sup>2583</sup>

An admixture of bupivacaine hydrochloride 25 mg/mL, clonidine hydrochloride 2 mg/mL, and morphine sulfate 50 mg/mL in sterile water for injection was reported to be physically and chemically stable for 90 days at 37°C in SynchroMed implantable pumps. Little or no loss of any of the drugs occurred.<sup>2585</sup>

## Buprenorphine Hydrochloride

AHFS 28:08.12

### Products

Buprenorphine hydrochloride is available in 1-mL ampuls. Each mL contains buprenorphine 0.3 mg (as the hydrochloride) with anhydrous dextrose 50 mg in water for injection. The pH is adjusted with hydrochloric acid.<sup>1(4/05)</sup>

### Osmolality

The osmolality was 297 mOsm/kg.<sup>1233</sup>

### Trade Name(s)

Buprenex

### Administration

Buprenorphine hydrochloride is administered by deep intramuscular injection or by intravenous injection slowly over at least 2 minutes.<sup>1(4/05)</sup> <sup>4</sup> It also has been given by continuous intravenous infusion at a concentration of 15 mcg/mL in sodium

chloride 0.9% and by epidural injection at a concentration of 6 to 30 mcg/mL.<sup>4</sup>

### Stability

The clear solution should be stored at 15 to 30°C and protected from prolonged exposure to light and exposure to temperatures in excess of 40°C and freezing.<sup>1(4/05)</sup> <sup>4</sup> Buprenorphine hydrochloride may undergo substantial decomposition when autoclaved.<sup>4</sup>

### Central Venous Catheter

Buprenorphine hydrochloride (Reckitt & Colman) 0.04 mg/mL in dextrose 5% was found to be compatible with the ARROW-g+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

## Busulfan

### AHFS 10:00

### Products

Busulfan is available as a 6-mg/mL concentrate for injection; busulfan is dissolved in a vehicle composed of 33% (v/v) *N,N*-dimethylacetamide (DMA) (approximately 309 mg DMA per mL of busulfan solution) and 67% (v/v) polyethylene glycol 400.<sup>2982 3047</sup> The concentrate for injection is packaged in 10-mL single-dose vials and must be diluted for administration.<sup>2982</sup>

### pH

Busulfan diluted for infusion to a concentration of approximately 0.5 mg/mL with sodium chloride 0.9% or dextrose 5% has a pH of 3.4 to 3.9, depending on which solution is used.<sup>2982</sup>

### Trade Name(s)

Busulfex

### Administration

Busulfan concentrate for injection must be diluted prior to administration.<sup>2982</sup> Sodium chloride 0.9% and dextrose 5% are both recommended diluents for dilution of busulfan concentrate for injection.<sup>2982</sup> The volume of infusion solution used for dilution should be 10 times the volume of the busulfan concentrate for injection dose to ensure that the final concentration is approximately 0.5 mg/mL.<sup>2982</sup>

Busulfan admixtures should be administered intravenously through a central venous catheter as a 2-hour infusion.<sup>2982</sup> More rapid infusion has not been tested and is not recommended.<sup>2982</sup> An infusion pump should be used to control the flow rate.<sup>2982</sup> The central venous catheter should be flushed before and after busulfan administration with approximately 5 mL of sodium chloride 0.9% or dextrose 5%.<sup>2982</sup> The manufacturer states that an administration set with a minimal residual volume (2 to 5 mL) should be used for busulfan administration.<sup>2982</sup>

As with other toxic drugs, caution should be exercised in the handling and preparation of busulfan, and applicable special handling and disposal procedures should be followed.<sup>2982</sup> Appropriate gloves should be worn during preparation; accidental skin exposure may result in skin reactions.<sup>2982</sup> The busulfan is added into an intravenous solution bag that already contains the appropriate amount of sodium chloride 0.9% or dextrose 5%.<sup>2982</sup> The drug should always be added to the diluent, not the diluent to the drug.<sup>2982</sup> The solution should be mixed thoroughly

by inverting the bag several times.<sup>2982</sup> Other diluents should not be used.<sup>2982</sup>

Busulfan (Pierre Fabre) 6 mg/mL was found to be incompatible with the silicone SmartSite needle-free valve of the MFX 2301E tubing set (CareFusion).<sup>2983</sup> Slight turbidity was noted immediately on injection of the busulfan into the valve and persisted throughout the 5-hour study period.<sup>2983</sup>

Polycarbonate syringes and filter needles should not be used with busulfan;<sup>2982</sup> the manufacturer notes that a precipitate has been known to form when syringes composed of or containing polycarbonate are used to withdraw busulfan from the vial.<sup>3046</sup>

### Stability

Busulfan concentrate for injection is a clear, colorless solution.<sup>2982</sup> Intact vials must be stored under refrigeration at 2 to 8°C.<sup>2982</sup> Solutions should be visually inspected for particulate matter and discoloration prior to administration; if particulate matter is observed in the vial, the concentrate for injection should not be used.<sup>2982</sup>

Administration of busulfan diluted for infusion in sodium chloride 0.9% or dextrose 5% should be completed within 8 hours when stored at 25°C.<sup>2982</sup> Administration of busulfan diluted for infusion in sodium chloride 0.9% should be completed within 12 hours when stored under refrigeration at 2 to 8°C.<sup>2982</sup>

Busulfan (Pierre Fabre) 6 mg/mL did not support the growth of *Staphylococcus aureus* and *Candida albicans* within 2 hours at room temperature.<sup>2740</sup> Busulfan 0.5 mg/mL in sodium chloride 0.9% did not support the growth of *Staphylococcus aureus*, *Enterococcus faecium*, or *Pseudomonas aeruginosa* with loss of viability over 24 to 48 hours at room temperature but had no effect on the growth of *Candida albicans*.<sup>2740</sup> Diluted solutions should be stored under refrigeration whenever possible, and the potential for microbiological growth should be considered when assigning expiration periods.<sup>2740</sup>

### Syringes

Busulfan (Pierre Fabre) 0.54 mg/mL in 0.9% sodium chloride stored in 50-mL polypropylene syringes (Becton Dickinson) fitted with tip caps (Braun) and protected from light at 2 to 8°C or 23 to 27°C was visually compatible and demonstrated less than 10% loss in 30 or 12 hours, respectively.<sup>3399</sup> White crystals were detected on the surface of the syringes after 33 hours at 2 to 8°C.<sup>3399</sup>

# Butorphanol Tartrate

AHFS 28:08.12

## Products

Butorphanol tartrate is available in concentrations of 1 mg/mL (in 1-mL vials) and 2 mg/mL (in 1- and 2-mL single-use vials and 10-mL multidose [preserved] vials).<sup>2904 2905</sup>

Each mL of solution also contains citric acid 3.3 mg, sodium citrate 7.29 mg (equivalent to sodium citrate anhydrous 6.4 mg),<sup>2904</sup> and sodium chloride 6.4 mg.<sup>2904 2905</sup> Also present in the multidose vials is 0.1 mg/mL of benzethonium chloride as a preservative.<sup>2904</sup>

## pH

From 3 to 5.5.<sup>2904</sup>

## Administration

Butorphanol tartrate may be administered by intramuscular or intravenous injection.<sup>2904 2905</sup>

## Stability

Butorphanol tartrate injection should be stored at controlled room temperature and retained in the original carton to protect from light.<sup>2904 2905</sup>

## Central Venous Catheter

Butorphanol tartrate (Apothecon) 0.04 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

# Caffeine Citrate

AHFS 28:20.32

## Products

Caffeine citrate is available as a 20-mg/mL solution in 3-mL (60-mg) vials. Each mL provides caffeine base 10 mg/mL with citric acid monohydrate 5 mg and sodium citrate dihydrate 8.3 mg/mL in water for injection.<sup>1(5/08)</sup>

## pH

The pH is adjusted to 4.7.<sup>1(5/08)</sup>

## Trade Name(s)

Cafcit

## Administration

Caffeine citrate injection is administered slowly intravenously using a syringe pump over 30 minutes as a loading dose and over 10 minutes as a maintenance dose.<sup>1(5/08) 4</sup>

## Stability

Intact vials of the clear, colorless injection should be stored at room temperature. The injection contains no antibacterial preservative and unused portions should be discarded.<sup>1(5/08)</sup>

## Syringes

Caffeine (salt form unspecified) 10 mg/mL was repackaged in glass and plastic syringes (Becton Dickinson) and stored at room temperature and 4°C. Less than 4% loss occurred over 60 days.<sup>139</sup>

## Calcitriol

AHFS 88:16

### Products

Calcitriol is available as 1 mL of solution in ampuls. Each mL of the Calcijex (Abbott) aqueous solution contains calcitriol 1 mcg, polysorbate 20 4 mg, sodium ascorbate 2.5 mg, and hydrochloric acid and/or sodium hydroxide to adjust pH.<sup>1(11/07)</sup>

Calcitriol injection (American Regent) utilizes a different formulation. Each mL of solution contains calcitriol 1 mcg, polysorbate 20 4 mg, sodium ascorbate 10 mg, sodium chloride 1.5 mg, dibasic sodium phosphate anhydrous 7.6 mg, monobasic sodium phosphate monohydrate 1.8 mg, and edetate disodium dihydrate.<sup>1(11/07)</sup>

### pH

The Calcijex (Abbott) injection has a target pH of 6.5 with a range of 5.9 to 7.0. Calcitriol injection (American Regent) has a pH in the range of 6.7 to 7.7.<sup>1(11/07)</sup>

### Tonicity

The injection is an isotonic solution.<sup>1(11/07)</sup>

### Trade Name(s)

Calcijex

### Administration

Calcitriol is given by intravenous injection. For patients undergoing hemodialysis, it may be administered by rapid intravenous injection through the catheter after a period of hemodialysis.<sup>4</sup>

### Stability

Calcitriol injection is a clear, colorless to yellow solution. It should be stored at controlled room temperature and protected from light.<sup>1(11/07)</sup> <sup>4</sup> Freezing and excessive heat should be avoided,

although brief exposure to temperatures up to 40°C does not adversely affect the injection.<sup>4</sup>

The product does not contain a preservative, and the manufacturers recommend discarding any unused solution.<sup>1(11/07)</sup> <sup>4</sup>

### Syringes

Calcitriol (Abbott) 1 and 2 mcg/mL undiluted and 0.5 mcg/mL diluted in dextrose 5%, sodium chloride 0.9%, and water for injection was evaluated for stability. It was stored in 1-mL polypropylene tuberculin syringes (Becton Dickinson) for eight hours at room temperature while exposed to normal room light. Little or no loss occurred during the study period.<sup>1662</sup>

### Sorption

The sorption potential of calcitriol (Abbott) to PVC bags and administration sets and to polypropylene syringes was evaluated by determining the apparent calcitriol polymer–water partition coefficients. The mean apparent partition coefficient was 66 times greater for PVC than polypropylene. In this test, 50% of the calcitriol was lost to PVC within two hours while approximately 4% was lost to polypropylene in 20 days.<sup>1662</sup>

Similar results were reported for calcitriol 1.5 mcg in 2000 mL of Dianeal PD-2, Midpeliq 250, and Peritoliq 250 in polyvinyl chloride peritoneal dialysis solution bags. Losses of up to 75% occurred in 72 hours due to sorption to the container material. However, the same combinations in polypropylene and glass containers exhibited only about 10 to 20% loss in 72 hours.<sup>2695</sup>

### Peritoneal Dialysis Solutions

Calcitriol (Abbott) in concentrations of 0.5 to 2 mcg/L in Dianeal (Baxter) with dextrose 1.5 and 4.5% and in Inpersol (Abbott) with dextrose 1.5% lost about 50% in two hours and about 75% in 20 hours due to sorption to the plastic bag.<sup>502</sup>

## Calcium Chloride

### AHFS 40:12

#### Products

Calcium chloride is available in 10-mL single-dose vials and prefilled syringes containing 1 g of calcium chloride (dihydrate), providing 13.6 mEq (270 mg) of calcium and 13.6 mEq of chloride in water for injection. The pH may have been adjusted with hydrochloric acid and/or calcium hydroxide.<sup>1(5/06) 4</sup>

#### pH

From 5.5 to 7.5 diluted in water to a 5% concentration.<sup>1(5/06) 4</sup>

#### Osmolarity

The 10% injection is labeled as having an osmolarity of 2.04 mOsm/mL.<sup>1(5/06)</sup>

#### Osmolality

The osmolality of a calcium chloride 10% solution was determined by osmometer to be 1765 mOsm/kg.<sup>1233</sup>

#### Administration

Calcium chloride is administered by direct intravenous injection or by continuous or intermittent intravenous infusion.

Intravenous administration should be performed slowly at a rate not exceeding 0.7 to 1.8 mEq/min. The drug may also be injected into the ventricular cavity in cardiac resuscitation. It must not be injected into the myocardium. Severe necrosis and sloughing may result if calcium chloride is injected intramuscularly or subcutaneously or leaks into the perivascular tissue.<sup>1(5/06) 4</sup>

#### Stability

The injection is clear and colorless. Intact vials should be stored at controlled room temperature. The single-use vials do not contain a preservative; the manufacturer recommends discarding any unused solution.<sup>1(5/06)</sup>

Calcium chloride injection under simulated summer conditions in paramedic vehicles was exposed to temperatures ranging from 26 to 38°C over 4 weeks. Analysis found no loss of the drug under these conditions.<sup>2562</sup>

**Additional Compatibility Information****Calcium and Phosphate****UNRECOGNIZED CALCIUM PHOSPHATE PRECIPITATION IN A 3-IN-1 PARENTERAL NUTRITION MIXTURE RESULTED IN PATIENT DEATH.**

The potential for the formation of a calcium phosphate precipitate in parenteral nutrition solutions is well studied and documented,<sup>1771 1777</sup> but the information is complex and difficult to apply to the clinical situation.<sup>1770 1772 1777</sup> The incorporation of fat emulsion in 3-in-1 parenteral nutrition solutions obscures any precipitate that is present, which has led to substantial debate on the dangers associated with 3-in-1 parenteral nutrition mixtures and when or if the danger to the patient is warranted therapeutically.<sup>1770 1771 1772 2031 2032 2033 2034 2035 2036</sup> Because such precipitation may be life-threatening to patients,<sup>2037 2291</sup> FDA issued a Safety Alert containing the following recommendations:<sup>1769</sup>

1. "The amounts of phosphorus and of calcium added to the admixture are critical. The solubility of the added calcium should be calculated from the volume at the time the calcium is added. It should not be based upon the final volume.

Some amino acid injections for TPN admixtures contain phosphate ions (as a phosphoric acid buffer). These phosphate ions and the volume at the time the phosphate is added should be considered when calculating the concentration of phosphate additives. Also, when adding calcium and phosphate to an admixture, the phosphate should be added first.

The line should be flushed between the addition of any potentially incompatible components.

2. A lipid emulsion in a 3-in-1 admixture obscures the presence of a precipitate. Therefore, if a lipid emulsion is needed, either (1) use a 2-in-1 admixture with the lipid infused separately, or (2) if a 3-in-1 admixture is medically necessary, then add the calcium before the lipid emulsion and according to the recommendations in number 1 above.

If the amount of calcium or phosphate which must be added is likely to cause a precipitate, some or all of the calcium should be administered separately. Such separate infusions must be properly diluted and slowly infused to avoid serious adverse events related to the calcium.

3. When using an automated compounding device, the above steps should be considered when programming the device. In addition, automated compounders should be maintained and operated according to the manufacturer's recommendations.

Any printout should be checked against the programmed admixture and weight of components.

4. During the mixing process, pharmacists who mix parenteral nutrition admixtures should periodically agitate the admixture and check for precipitates. Medical or home care personnel who start and monitor these infusions should carefully inspect for the presence of precipitates both before and during infusion. Patients and care givers should be trained to visually inspect for signs of precipitation. They also should be advised to stop the infusion and seek medical assistance if precipitates are noted.
5. A filter should be used when infusing either central or peripheral parenteral nutrition admixtures. At this time, data have not been submitted to document which size filter is most effective in trapping precipitates.

Standards of practice vary, but the following is suggested: a 1.2- $\mu$ m air-eliminating filter for lipid-containing admixtures and a 0.22- $\mu$ m air-eliminating filter for non-lipid-containing admixtures.

6. Parenteral nutrition admixtures should be administered within the following time frames: if stored at room temperature, the infusion should be started within 24 hours after mixing; if stored at refrigerated temperatures, the infusion should be started within 24 hours of rewarming. Because warming parenteral nutrition admixtures may contribute to the formation of precipitates, once administration begins, care should be taken to avoid excessive warming of the admixture.

Persons administering home care parenteral nutrition admixtures may need to deviate from these time frames. Pharmacists who initially prepare these admixtures should check a reserve sample for precipitates over the duration and under the conditions of storage.

- If symptoms of acute respiratory distress, pulmonary emboli, or interstitial pneumonitis develop, the infusion should be stopped immediately and thoroughly checked for precipitates. Appropriate medical interventions should be instituted. Home care personnel and patients should immediately seek medical assistance.<sup>11769</sup>

### Calcium Phosphate Precipitation Fatalities

Fatal cases of paroxysmal respiratory failure in 2 previously healthy women receiving peripheral vein parenteral nutrition were reported. The patients experienced sudden cardiopulmonary arrest consistent with pulmonary emboli. The authors used in vitro simulations and an animal model to conclude that unrecognized calcium phosphate precipitation in a 3-in-1 total nutrition admixture caused the fatalities. The precipitation resulted during compounding by introducing calcium and phosphate near to one another in the compounding sequence and prior to complete fluid addition. This resulted in a temporarily high concentration of the drugs and precipitation of calcium phosphate. Observation of the precipitate was obscured by the incorporation of 20% fat emulsion, intravenous, into the nutrition mixture. No filter was used during infusion of the fatal nutrition admixtures.<sup>2037</sup>

In a follow-up retrospective review, 5 patients were identified who had respiratory distress associated with the infusion of the 3-in-1 admixtures at around the same time. Four of these 5 patients died, although the cause of death could be definitively determined for only 2.<sup>2291</sup>

### Calcium and Phosphate Conditional Compatibility

Calcium salts are conditionally compatible with phosphate in parenteral nutrition solutions. The incompatibility is dependent on a solubility and concentration phenomenon and is not entirely predictable. Precipitation may occur during compounding or at some time after compounding is completed.

NOTE: Some amino acid solutions inherently contain calcium and phosphate, which must be considered in any projection of compatibility.

A study determined the maximum concentrations of calcium (as chloride and gluconate) and phosphate (as sodium phosphates) that can be maintained without precipitation in a parenteral nutrition solution consisting of FreAmine II 4.25% and dextrose 25% for 24 hours at 30°C. It was noted that the amino acids in parenteral nutrition solutions form soluble complexes with calcium and phosphate, reducing the available free calcium and phosphate that can form insoluble precipitates. The concentration of calcium available for precipitation is greater with the chloride salt compared to the gluconate salt, at least in part

because of differences in dissociation characteristics. Consequently, a greater concentration of calcium gluconate than calcium chloride can be mixed with sodium phosphate.<sup>608</sup>

In addition to the concentrations of phosphate and calcium and the salt form of the calcium, the concentration of amino acids and the time and temperature of storage altered the formation of calcium phosphate in parenteral nutrition solutions. As the temperature was increased, the incidence of precipitate formation also increased. This finding was attributed, at least in part, to a greater degree of dissociation of the calcium and phosphate complexes and the decreased solubility of calcium phosphate. Therefore, a solution possibly may be stored at 4°C with no precipitation, but on warming to room temperature a precipitate will form over time.<sup>608</sup>

The maximum allowable concentrations of calcium and phosphate in a 3-in-1 parenteral nutrition mixture for children (TNA #192 in Appendix) were reported. Added calcium was varied from 1.5 to 150 mmol/L, and added phosphate was varied from 21 to 300 mmol/L. These mixtures were stable for 48 hours at 22 and 37°C as long as the pH was not greater than 5.7, the calcium concentration was below 16 mmol/L, the phosphate concentration was below 52 mmol/L, and the product of the calcium and phosphate concentrations was below 250 mmol<sup>2</sup>/L<sup>2</sup> (mmol squared per liter squared).<sup>1773</sup>

The presence of magnesium in solutions may also influence the reaction between calcium and phosphate, including the nature and extent of precipitation.<sup>158 159</sup>

The interaction of calcium and phosphate in parenteral nutrition solutions is a complex phenomenon. Various factors play a role in the solubility or precipitation of a given combination, including:<sup>608 609 1042 1063 1210 1234 1427 2778</sup>

- Concentration of calcium
- Salt form of calcium
- Concentration of phosphate
- Concentration of amino acids
- Amino acids composition
- Concentration of dextrose
- Temperature of solution
- pH of solution
- Presence of other additives
- Order of mixing

Enhanced precipitate formation would be expected from such factors as high concentrations of calcium and phosphate, increases in solution pH, decreases in amino acid concentrations, increases in temperature, addition of calcium before phosphate, lengthy standing times or slow infusion rates, and use of calcium as the chloride salt.<sup>854</sup>

Even if precipitation does not occur in the container, it has been reported that crystallization of calcium phosphate may occur in a Silastic infusion pump chamber or tubing if the rate of administration is slow, as for premature infants. Water vapor may be transmitted outward and be replaced by air rapidly enough to produce supersaturation.<sup>202</sup> Several other cases of catheter occlusion have been reported.<sup>610 1427 1428 1429</sup>

## Calcium Gluconate

### AHFS 40:12

#### Products

Calcium gluconate is available in 10- and 50-mL single-dose (preservative-free) vials and 100-mL pharmacy bulk packages as a 10% solution.<sup>3289</sup> Each mL contains 100 mg of calcium gluconate (equivalent to 94 mg of calcium gluconate with 4.5 mg of calcium saccharate tetrahydrate) and hydrochloric acid and/or sodium hydroxide for pH adjustment in water for injection, providing 9.3 mg (0.465 mEq) of elemental calcium.<sup>3289</sup> Aluminum also is present.<sup>3289</sup>

For direct intravenous injection, the calcium gluconate dose should be diluted in dextrose 5% or sodium chloride 0.9% to a concentration of 10 to 50 mg/mL.<sup>3289</sup> For continuous intravenous infusion, the calcium gluconate dose should be diluted in dextrose 5% or sodium chloride 0.9% to a concentration of 5.8 to 10 mg/mL.<sup>3289</sup>

#### pH

From 6 to 8.2.<sup>3289</sup>

#### Osmolarity

The osmolarity is stated to be 680 mOsm/L.<sup>3313</sup>

#### Osmolality

The osmolality of a calcium gluconate 10% solution was determined by osmometer to be 276 mOsm/kg.<sup>1233</sup>

#### Administration

Calcium gluconate usually is administered intravenously, slowly by direct intravenous injection, or by continuous or intermittent intravenous infusion, following appropriate dilution in dextrose 5% or sodium chloride 0.9%.<sup>3289</sup> The drug diluted for infusion should be administered through a secure intravenous line.<sup>3289</sup> When calcium gluconate diluted in a compatible infusion solution is administered slowly by direct intravenous injection or by

continuous or intermittent intravenous infusion, the infusion rate should not exceed 200 mg of calcium gluconate per minute in adults or 100 mg of calcium gluconate per minute in pediatric patients, including neonates.<sup>3289</sup>

Intramuscular or subcutaneous injection of the drug is *not* recommended because of possible severe necrosis and sloughing.<sup>183 184 185 359 3313</sup> If extravasation occurs or if clinical manifestations of calcinosis cutis are present, administration at that site should be discontinued and appropriate treatment should be instituted.<sup>3289</sup>

#### Stability

Calcium gluconate injection is a supersaturated solution that has been stabilized by the addition of calcium saccharate.<sup>3313</sup> Intact vials should be stored at controlled room temperature.<sup>3289</sup> Freezing should be avoided.<sup>3289</sup> The solution should appear clear and colorless to slightly yellow; the solution should not be used if particulate matter or a precipitate is present or if discoloration has occurred.<sup>3289</sup>

The manufacturer states that doses dispensed from the pharmacy bulk package and diluted solutions must be used immediately.<sup>3289</sup> Unused portions of single-dose vials should be discarded immediately, and pharmacy bulk packages should be discarded after 4 hours of initial puncture.<sup>3289</sup>

#### Precipitation

Calcium gluconate injection is a supersaturated solution, and such solutions are susceptible to precipitation.<sup>3289</sup> If precipitates have formed, they may be dissolved by warming affected vials to 60 to 80°C with occasional agitation until a clear solution results, followed by vigorous shaking of the vials.<sup>3289</sup> Warmed vials should be allowed to cool to room temperature prior to dispensing.<sup>3289</sup> Contents of such vials should only be used if they are clear immediately prior to use.<sup>3289</sup>

**Additional Compatibility Information****Calcium and Phosphate****UNRECOGNIZED CALCIUM PHOSPHATE PRECIPITATION IN A 3-IN-1 PARENTERAL NUTRITION MIXTURE RESULTED IN PATIENT DEATH.**

The potential for the formation of a calcium phosphate precipitate in parenteral nutrition solutions is well studied and documented,<sup>1771 1777</sup> but the information is complex and difficult to apply to the clinical situation.<sup>1770 1772 1777</sup> The incorporation of fat emulsion in 3-in-1 parenteral nutrition solutions obscures any precipitate that is present, which has led to substantial debate on the dangers associated with 3-in-1 parenteral nutrition mixtures and when or if the danger to the patient is warranted therapeutically.<sup>1770 1771 1772 2031 2032 2033 2034 2035 2036</sup> Because such precipitation may be life-threatening to patients,<sup>2037 2291</sup> FDA issued a Safety Alert containing the following recommendations:<sup>1769</sup>

1. "The amounts of phosphorus and of calcium added to the admixture are critical. The solubility of the added calcium should be calculated from the volume at the time the calcium is added. It should not be based upon the final volume.

Some amino acid injections for TPN admixtures contain phosphate ions (as a phosphoric acid buffer). These phosphate

ions and the volume at the time the phosphate is added should be considered when calculating the concentration of phosphate additives. Also, when adding calcium and phosphate to an admixture, the phosphate should be added first.

The line should be flushed between the addition of any potentially incompatible components.

2. A lipid emulsion in a 3-in-1 admixture obscures the presence of a precipitate. Therefore, if a lipid emulsion is needed, either (1) use a 2-in-1 admixture with the lipid infused separately, or (2) if a 3-in-1 admixture is medically necessary, then add the calcium before the lipid emulsion and according to the recommendations in number 1 above.

If the amount of calcium or phosphate which must be added is likely to cause a precipitate, some or all of the calcium should be administered separately. Such separate infusions must be properly diluted and slowly infused to avoid serious adverse events related to the calcium.

3. When using an automated compounding device, the above steps should be considered when programming the device. In addition, automated compounders should be maintained and operated according to the manufacturer's recommendations.

Any printout should be checked against the programmed admixture and weight of components.

- During the mixing process, pharmacists who mix parenteral nutrition admixtures should periodically agitate the admixture and check for precipitates. Medical or home care personnel who start and monitor these infusions should carefully inspect for the presence of precipitates both before and during infusion. Patients and care givers should be trained to visually inspect for signs of precipitation. They also should be advised to stop the infusion and seek medical assistance if precipitates are noted.
- A filter should be used when infusing either central or peripheral parenteral nutrition admixtures. At this time, data have not been submitted to document which size filter is most effective in trapping precipitates.

Standards of practice vary, but the following is suggested: a 1.2- $\mu\text{m}$  air-eliminating filter for lipid-containing admixtures and a 0.22- $\mu\text{m}$  air-eliminating filter for non-lipid-containing admixtures.

- Parenteral nutrition admixtures should be administered within the following time frames: if stored at room temperature, the infusion should be started within 24 hours after mixing; if stored at refrigerated temperatures, the infusion should be started within 24 hours of rewarming. Because warming parenteral nutrition admixtures may contribute to the formation of precipitates, once administration begins, care should be taken to avoid excessive warming of the admixture.

Persons administering home care parenteral nutrition admixtures may need to deviate from these time frames. Pharmacists who initially prepare these admixtures should check a reserve sample for precipitates over the duration and under the conditions of storage.

- If symptoms of acute respiratory distress, pulmonary emboli, or interstitial pneumonitis develop, the infusion should be stopped immediately and thoroughly checked for precipitates. Appropriate medical interventions should be instituted. Home care personnel and patients should immediately seek medical assistance.<sup>11769</sup>

### Calcium Phosphate Precipitation Fatalities

Fatal cases of paroxysmal respiratory failure in 2 previously healthy women receiving peripheral vein parenteral nutrition were reported. The patients experienced sudden cardiopulmonary arrest consistent with pulmonary emboli. The authors used in vitro simulations and an animal model to conclude that unrecognized calcium phosphate precipitation in a 3-in-1 total nutrition admixture caused the fatalities. The precipitation resulted during compounding by introducing calcium and phosphate near to one another in the compounding sequence and prior to complete fluid addition. This resulted in a temporarily high concentration of the drugs and precipitation of calcium phosphate. Observation of the precipitate was obscured by the incorporation of 20% fat emulsion, intravenous, into the nutrition mixture. No filter was used during infusion of the fatal nutrition admixtures.<sup>2037</sup>

In a follow-up retrospective review, 5 patients were identified who had respiratory distress associated with the infusion of the 3-in-1 admixtures at around the same time. Four of these 5 patients died, although the cause of death could be definitively determined for only 2.<sup>2291</sup>

### Calcium and Phosphate Conditional Compatibility

Calcium salts are conditionally compatible with phosphate in parenteral nutrition solutions. The incompatibility is dependent on a solubility and concentration phenomenon and is not entirely predictable. Precipitation may occur during compounding or at some time after compounding is completed.

NOTE: Some amino acid solutions inherently contain both calcium and phosphate, which must be considered in any projection of compatibility.

A study determined the maximum concentrations of calcium (as chloride and gluconate) and phosphate (as sodium phosphates) that can be maintained without precipitation in a parenteral nutrition solution consisting of FreAmine II 4.25% and dextrose 25% for 24 hours at 30°C. It was noted that the amino acids in parenteral nutrition solutions form soluble complexes with calcium and phosphate, reducing the available free calcium and phosphate that can form insoluble precipitates. The concentration of calcium available for precipitation is greater with the chloride salt compared to the gluconate salt, at least in part because of differences in dissociation characteristics. Consequently, a greater concentration of calcium gluconate than calcium chloride can be mixed with sodium phosphate.<sup>608</sup>

In addition to the concentrations of phosphate and calcium and the salt form of the calcium, the concentration of amino acids and the time and temperature of storage altered the formation of calcium phosphate in parenteral nutrition solutions. As the temperature was increased, the incidence of precipitate formation also increased. This finding was attributed, at least in part, to a greater degree of dissociation of the calcium and phosphate complexes and the decreased solubility of calcium phosphate. Therefore, a solution possibly may be stored at 4°C with no precipitation, but on warming to room temperature a precipitate will form over time.<sup>608</sup>

The compatibility of calcium and phosphate in several parenteral nutrition formulas for newborn infants was evaluated. Calcium gluconate 10% (Cutter) and potassium phosphate (Abbott) were used to achieve concentrations of 2.5 to 100 mEq/L of calcium and 2.5 to 100 mmol/L of phosphorus added. The parenteral nutrition solutions evaluated were as shown in Table 1. The results were reported as graphic depictions.

**Table 1. Parenteral nutrition solutions<sup>609</sup>**

Component	Solution Number			
	#1	#2	#3	#4
FreAmine III	4%	2%	1%	1%
Dextrose	25%	20%	10%	10%
pH	6.3	6.4	6.6	7 <sup>a</sup>

<sup>a</sup> Adjusted with sodium hydroxide.

The pH dependence of the phosphate–calcium precipitation has been noted. Dibasic calcium phosphate is very insoluble, while monobasic calcium phosphate is relatively soluble. At low pH, the soluble monobasic form predominates; but as the pH increases, more dibasic phosphate becomes available to bind with calcium

and precipitate. Therefore, the lower the pH of the parenteral nutrition solution, the more calcium and phosphate can be solubilized. Once again, the effects of temperature were observed. As the temperature is increased, more calcium ion becomes available and more dibasic calcium phosphate is formed. Therefore, temperature increases will increase the amount of precipitate.<sup>609</sup>

Similar calcium and phosphate solubility curves were reported for neonatal parenteral nutrition solutions using TrophAmine (McGaw) 2, 1.5, and 0.8% as the sources of amino acids. The solutions also contained dextrose 10%, with cysteine and pH adjustment being used in some admixtures. Calcium and phosphate solubility followed the patterns reported previously.<sup>609</sup> A slightly greater concentration of phosphate could be used in some mixtures, but this finding was not consistent.<sup>1024</sup>

Using a similar study design, 6 neonatal parenteral nutrition solutions based on Aminosyn-PF (Abbott) 2, 1.5, and 0.8%, with and without added cysteine hydrochloride and dextrose 10% were studied. Calcium concentrations ranged from 2.5 to 50 mEq/L, and phosphate concentrations ranged from 2.5 to 50 mmol/L. Solutions sat for 18 hours at 25°C and then were warmed to 37°C in a water bath to simulate the clinical situation of warming prior to infusion into a child. Solubility curves were markedly different than those for TrophAmine in the previous study.<sup>1024</sup> Solubilities were reported to decrease by 15 mEq/L for calcium and 15 mmol/L for phosphate. The solutions remained clear during room temperature storage, but crystals often formed on warming to 37°C.<sup>1211</sup>

However, these data were questioned by Mikrut, who noted the similarities between the Aminosyn-PF and TrophAmine products and found little difference in calcium and phosphate solubilities in a preliminary report.<sup>1212</sup> In the full report,<sup>1213</sup> parenteral nutrition solutions containing Aminosyn-PF or TrophAmine 1 or 2.5% with dextrose 10 or 25%, respectively, plus electrolytes and trace metals, with or without cysteine hydrochloride, were evaluated under the same conditions. Calcium concentrations ranged from 2.5 to 50 mEq/L, and phosphate concentrations ranged from 5 to 50 mmol/L. In contrast to the previous results,<sup>1024</sup> the solubility curves were very similar for the Aminosyn-PF and TrophAmine parenteral nutrition solutions but very different from those of the previous Aminosyn-PF study.<sup>1211</sup> The authors again showed that the solubility of calcium and phosphate is greater in solutions containing higher concentrations of amino acids and dextrose.<sup>1213</sup>

Calcium and phosphate solubility curves for TrophAmine 1 and 2% with dextrose 10% and electrolytes, vitamins, heparin, and trace elements were reported. Calcium concentrations ranged from 10 to 60 mEq/L, and phosphorus concentrations ranged from 10 to 40 mmol/L. Calcium and phosphate solubilities were assessed by analysis of the calcium concentrations and followed patterns similar to those reported previously.<sup>608 609</sup> The higher percentage of amino acids (TrophAmine 2%) permitted a slightly greater solubility of calcium and phosphate, especially in the 10 to 50-mEq/L and 10 to 35-mmol/L ranges, respectively.<sup>1614</sup>

The maximal product of the amount of calcium (as gluconate) times phosphate (as potassium) that can be added to a parenteral nutrition solution, composed of amino acids 1% (Travenol) and dextrose 10%, for preterm infants was reported. Turbidity was observed on initial mixing when the solubility product was

around 115 to 130 mmol<sup>2</sup> (mmol squared) or greater. After storage at 7°C for 20 hours, visible precipitates formed at solubility products of 130 mmol<sup>2</sup> (mmol squared) or greater. If the solution was administered through a barium-impregnated silicone rubber catheter, crystalline precipitates obstructed the catheters in 12 hours at a solubility product of 100 mmol<sup>2</sup> (mmol squared) and in 10 days at 79 mmol<sup>2</sup> (mmol squared), much lower than the in vitro results.<sup>1041</sup>

The solubility characteristics of calcium and phosphate in pediatric parenteral nutrition solutions composed of Aminosyn 0.5, 2, and 4% with dextrose 10 to 25% were reported. Also present were electrolytes and vitamins. Sodium phosphate was added sequentially in phosphorus concentrations from 10 to 30 mmol/L. Calcium gluconate was added last in amounts ranging from 1 to 10 g/L. The solutions were stored at 25°C for 30 hours and examined visually and microscopically for precipitation. The authors found that higher concentrations of Aminosyn increased the solubility of calcium and phosphate. Precipitation occurred at lower calcium and phosphate concentrations in the 0.5% solution compared to the 2 and 4% solutions. For example, at a phosphorus concentration of 30 mmol/L, precipitation occurred at calcium gluconate concentrations of about 1, 2, and 4 g/L in the 0.5, 2, and 4% Aminosyn mixtures, respectively. Similarly, at a calcium gluconate concentration of 8 g/L and above, precipitation occurred at phosphorus concentrations of about 13, 17, and 22 mmol/L in the 0.5, 2, and 4% solutions, respectively. The dextrose concentration did not appear to affect the calcium and phosphate solubility significantly.<sup>1042</sup>

The solubility of calcium and phosphorus in neonatal parenteral nutrition solutions composed of amino acids (Abbott) 1.25 and 2.5% with dextrose 5 and 10%, respectively, was evaluated. Also present were multivitamins and trace elements. The solutions contained calcium (as gluconate) in amounts ranging from 25 to 200 mg/100 mL. The phosphorus (as potassium phosphate) concentrations evaluated ranged from 25 to 150 mg/100 mL. If calcium gluconate was added first, cloudiness occurred immediately. If potassium phosphate was added first, substantial quantities could be added with no precipitate formation in 48 hours at 4°C (Table 2). However, if stored at 22°C, the solutions were stable for only 24 hours, and all contained precipitates after 48 hours.<sup>1210</sup>

**Table 2. Maximum calcium and phosphorus concentrations physically compatible for 48 hours at 4°C<sup>1210</sup>**

Calcium (mg/100 mL)	Phosphorus (mg/100 mL)	
	Amino Acids 1.25% + Dextrose 5% <sup>a</sup>	Amino Acids 2.5% + Dextrose 10% <sup>a</sup>
200 <sup>b</sup>	50	75
150	50	100
100	75	100
50	100	125
25	150 <sup>b</sup>	150 <sup>b</sup>

<sup>a</sup> Plus multivitamins and trace elements.

<sup>b</sup> Maximum concentration tested.

The physical compatibility of calcium gluconate 10 to 40 mEq/L and potassium phosphates 10 to 40 mmol/L in 3 neonatal parenteral nutrition solutions (TPN #123 to #125 in Appendix), alone and with retrograde administration of aminophylline 7.5 mg diluted with 1.5 mL of sterile water for injection was reported. Contact of the alkaline aminophylline solution with the parenteral nutrition solutions resulted in the precipitation of calcium phosphate at much lower concentrations than were compatible in the parenteral nutrition solutions alone.<sup>1404</sup>

The maximum allowable concentrations of calcium and phosphate in a 3-in-1 parenteral nutrition mixture for children (TNA #192 in Appendix) were reported. Added calcium was varied from 1.5 to 150 mmol/L, while added phosphate was varied from 21 to 300 mmol/L. The mixtures were stable for 48 hours at 22 and 37°C as long as the pH was not greater than 5.7, the calcium concentration was below 16 mmol/L, the phosphate concentration was below 52 mmol/L, and the product of the calcium and phosphate concentrations was below 250 mmol<sup>2</sup>/L<sup>2</sup> (mmol squared per liter squared).<sup>1773</sup>

Additional calcium and phosphate solubility curves were reported for specialty parenteral nutrition solutions based on NephroAmine and also HepatAmine at concentrations of 0.8, 1.5, and 2% as the sources of amino acids. The solutions also contained dextrose 10%, with cysteine and pH adjustment to simulate addition of fat emulsion used in some admixtures. Calcium and phosphate solubility followed the hyperbolic patterns previously reported.<sup>609</sup> Temperature, time, and pH affected calcium and phosphate solubility, with pH having the greatest effect.<sup>2038</sup>

The maximum sodium phosphate concentrations were reported for given amounts of calcium gluconate that could be admixed in parenteral nutrition solutions containing TrophAmine in varying quantities (with cysteine hydrochloride 40 mg/g of amino acid) and dextrose 10%. The solutions also contained magnesium sulfate 4 mEq/L, potassium acetate 24 mEq/L, sodium chloride 32 mEq/L, pediatric multivitamins, and trace elements. The presence of cysteine hydrochloride reduces the solution pH and increases the amount of calcium and phosphate that can be incorporated before precipitation occurs. The results of this study cannot be safely extrapolated to TPN solutions with compositions other than the ones tested. The admixtures were compounded with the sodium phosphate added last after thorough mixing of all other components. The authors noted that this is not the preferred order of mixing (usually phosphate is added first and thoroughly mixed before adding calcium last); however, they believed this reversed order of mixing would provide a margin of error in cases in which the proper order is not followed. After compounding, the solutions were stored for 24 hours at 40°C. The maximum calcium and phosphate amounts that could be mixed in the various solutions were reported tabularly and are shown in Table 3.<sup>2039</sup> However, these results are not entirely consistent with another study.<sup>2196</sup> See below.

**Table 3. Maximum amount of phosphate (as sodium) (mmol/L) not resulting in precipitation.<sup>2039</sup> See CAUTION below.<sup>a</sup>**

Calcium (as Gluconate)	Amino Acid (as TrophAmine) with Cysteine HCl 40 mg/g of Amino Acid				
	0%	0.4%	1%	2%	3%
9.8 mEq/L	0	27	42	60	66
14.7 mEq/L	0	15	18	30	36
19.6 mEq/L	0	6	15	27	30
29.4 mEq/L	0	3	6	21	24

<sup>a</sup> CAUTION: The results cannot be safely extrapolated to solutions with formulas other than the ones tested. See text.

The temperature dependence of the calcium-phosphate precipitation has resulted in the occlusion of a subclavian catheter by a solution apparently free of precipitation. The parenteral nutrition solution consisted of FreAmine III 500 mL, dextrose 70% 500 mL, sodium chloride 50 mEq, sodium phosphate 40 mmol, potassium acetate 10 mEq, potassium phosphate 40 mmol, calcium gluconate 10 mEq, magnesium sulfate 10 mEq, and Shil's trace metals solution 1 mL. Although there was no evidence of precipitation in the bottle, tubing and pump cassette, and filter (all at approximately 26°C) during administration, the occluded catheter and Vicra Loop Lock (next to the patient's body at 37°C) had numerous crystals identified as calcium phosphate. In vitro, this parenteral nutrition solution had a precipitate in 12 hours at 37°C but was clear for 24 hours at 26°C.<sup>610</sup>

Similarly, a parenteral nutrition solution that was clear and free of particulates after 2 weeks under refrigeration developed a precipitate in 4 to 6 hours when stored at room temperature. When the solution was warmed in a 37°C water bath, precipitation occurred in 1 hour. Administration of the solution before the precipitate was noticed led to interstitial pneumonitis due to deposition of calcium phosphate crystals.<sup>1427</sup>

A 2-mL fluid barrier of dextrose 5% in a microbore retrograde infusion set failed to prevent precipitation when used between calcium gluconate 200 mg/2 mL and sodium phosphate 0.3 mmol/0.1 mL.<sup>1385</sup>

Calcium phosphate precipitation phenomena was evaluated in a series of parenteral nutrition admixtures composed of dextrose 22%, amino acids (FreAmine III) 2.7%, and fat emulsion (Abbott) 0, 1, and 3.2%. Incorporation of calcium gluconate 19 to 24 mEq/L and phosphate (as sodium) 22 to 28 mmol/L resulted in visible precipitation in the fat-free admixtures. New precipitate continued to form over 14 days, even after repeated filtrations of the solutions through 0.2- $\mu$ m filters. The presence of the amino acids increased calcium and phosphate solubility, compared with simple aqueous solutions. However, the incorporation of the fat emulsion did not result in a statistically significant increase in calcium and phosphate solubility. The authors noted that the kinetics of calcium phosphate precipitate

formation do not appear to be entirely predictable; both transient and permanent precipitation can occur either during the compounding process or at some time afterward. Because calcium phosphate precipitation can be very dangerous clinically, the use of inline filters was recommended. The authors suggested that the filters should have a porosity appropriate to the parenteral nutrition admixture—1.2 μm for fat-containing and 0.2 or 0.45 μm for fat-free nutrition mixtures.<sup>2061</sup>

Laser particle analysis was used to evaluate the formation of calcium phosphate precipitation in pediatric TPN solutions containing TrophAmine in concentrations ranging from 0.5 to 3% with dextrose 10% and also containing L-cysteine hydrochloride 1 g/L. The solutions also contained in each liter sodium chloride 20 mEq, sodium acetate 20 mEq, magnesium sulfate 3 mEq, trace elements 3 mL, and heparin sodium 500 units. The presence of L-cysteine hydrochloride reduces the solution pH and increases the amount of calcium and phosphate that can be incorporated before precipitation occurs. The results of this study cannot be safely extrapolated to TPN solutions with compositions other than the ones tested. The maximum amount of phosphate that was incorporated without the appearance of a measurable increase in particulates in 24 hours at 37°C for each of the amino acids concentrations is shown in Table 4.<sup>2196</sup> These results are not entirely consistent with previous results.<sup>2039</sup> See Table 3. The use of more sensitive electronic particle measurement for the formation of subvisual particulates in this study may contribute to the differences in the results.

**Table 4. Maximum amount of phosphate (as potassium) (mmol/L) not resulting in precipitation.<sup>2196</sup> See CAUTION below.<sup>a</sup>**

<sup>a</sup> CAUTION: The results cannot be safely extrapolated to solutions with formulas other than the ones tested. See text.

The solubility of calcium acetate versus calcium gluconate with sodium phosphates was evaluated in pediatric parenteral

nutrition solutions following storage for 30 hours at 25°C followed by 30 minutes at 37°C. Concentrations of Aminosyn PF studied varied from 1 to 3%, dextrose from 10 to 25%, calcium from 5 to 60 mEq/L, and phosphate from 1 to 60 mmol/L. L-Cysteine hydrochloride at a dose of 40 mg/g of Aminosyn PF, magnesium 3.2 mEq/L, and pediatric trace elements-4 at 2.4 mL/L of pediatric parenteral nutrition solution were also added. Calcium acetate was found to be less soluble than calcium gluconate when prepared under these concentrations. The maximum concentrations of the calcium salts and sodium phosphates are shown in Table 5. Polarized light microscopy was used to identify the calcium acetate and sodium phosphate crystals adherent to the container walls because simple visual observation was not able to identify the precipitates. The authors recommended the use of calcium acetate to reduce the iatrogenic aluminum exposure often seen with calcium gluconate in the neonatal population receiving parenteral nutrition.<sup>2466</sup> However, care must be taken to avoid inadvertent calcium phosphate precipitation at the lower concentrations found with calcium acetate if it is substituted for the gluconate salt to reduce aluminum exposure.

**Table 5. Maximum concentrations of sodium phosphates and calcium as acetate and as gluconate not resulting in precipitation<sup>2466</sup>**

Aminosyn PF (%)	Sodium Phosphates (mmol/L)	Calcium Acetate (mEq/L)	Calcium Gluconate (mEq/L)
1	10	25	50
1	15	15	25
2	10	30	45
2	25	10	12.5
3	20	10	15
3	25	15	17.5

Calcium and phosphate compatibility was evaluated in a series of adult formula parenteral nutrition admixtures composed of FreAmine III, in concentrations ranging from 1 to 5% (TPN #258 through #262). The solutions also contained dextrose ranging from 15% up to 25%. Also present were sodium chloride, potassium chloride, and magnesium sulfate in common amounts. Cysteine hydrochloride was added in an amount of 25 mg/g of amino acids from FreAmine III to reduce the pH by about 0.5 pH unit and thereby increase the amount of calcium and phosphates that can be added to the TPN admixtures as has been done with pediatric parenteral nutrition admixtures. Phosphates as the potassium salts and calcium as the gluconate salt were added in variable quantities to determine the maximum amounts of calcium and phosphates that could be added to the test admixtures. The samples were evaluated at 23 and 37°C over 48 hours by visual inspection in ambient light and using a Tyndall beam and electronic measurement of turbidity and microparticulates. The addition of the cysteine hydrochloride resulted in an increase of calcium and phosphates solubility of about 30% by lowering the solution pH 0.5 pH unit. The bound-

aries between the compatible and incompatible concentrations were presented graphically as hyperbolic curves.<sup>2469</sup>

A 2-in-1 parenteral nutrition admixture with final concentrations of TrophAmine 0.5%, dextrose 5%, L-cysteine hydrochloride 40 mg/g of amino acids, calcium gluconate 60 mg/100 mL, and sodium phosphates 46.5 mg/mL was found to result in visible precipitation of calcium phosphate within 30 hours stored at 23 to 27°C. Despite the presence of the acidifying L-cysteine hydrochloride, precipitation occurred at clinically utilized amounts of calcium and phosphates.<sup>2622</sup>

The presence of magnesium in solutions may also influence the reaction between calcium and phosphate, including the nature and extent of precipitation.<sup>158 159</sup>

The interaction of calcium and phosphate in parenteral nutrition solutions is a complex phenomenon. Various factors play a role in the solubility or precipitation of a given combination, including:<sup>608 609 1042 1063 1210 1234 1427 2778</sup>

1. Concentration of calcium
2. Salt form of calcium
3. Concentration of phosphate
4. Concentration of amino acids
5. Amino acids composition
6. Concentration of dextrose
7. Temperature of solution
8. pH of solution

9. Presence of other additives
10. Order of mixing

Enhanced precipitate formation would be expected from such factors as high concentrations of calcium and phosphate, increases in solution pH, decreases in amino acid concentrations, increases in temperature, addition of calcium before phosphate, lengthy standing times or slow infusion rates, and use of calcium as the chloride salt.<sup>854</sup>

Even if precipitation does not occur in the container, it has been reported that crystallization of calcium phosphate may occur in a Silastic infusion pump chamber or tubing if the rate of administration is slow, as for premature infants. Water vapor may be transmitted outward and be replaced by air rapidly enough to produce supersaturation.<sup>202</sup> Several other cases of catheter occlusion also have been reported.<sup>610 1427 1428 1429</sup>

### Aluminum

Calcium gluconate injection in glass vials is a significant source of aluminum, which has been associated with neurological impairment in premature neonates. Aluminum is leached from the glass vial during the autoclaving of the vials for sterilization. The use of calcium gluconate injection in polyethylene plastic vials in countries where it is available has been recommended to reduce the aluminum burden for neonates.<sup>2322</sup>

## Cangrelor Tetrasodium

AHFS 20:12.18

### Products

Cangrelor is available as a lyophilized powder in single-use vials containing 50 mg of cangrelor as the tetrasodium salt.<sup>3023</sup> Each vial also contains mannitol, sorbitol, and sodium hydroxide to adjust the pH.<sup>3023</sup>

Each 50-mg vial of cangrelor should be reconstituted with 5 mL of sterile water for injection.<sup>3023</sup> The vial should be gently swirled until all of the powder has fully dissolved; vigorous mixing should be avoided.<sup>3023</sup> Any foam that forms should be allowed to settle.<sup>3023</sup> The reconstituted solution should be visually inspected for particulate matter.<sup>3023</sup>

The reconstituted solution must be diluted prior to administration.<sup>3023</sup> The entire contents of the vial should be withdrawn and diluted in an infusion bag containing 250 mL of sodium chloride 0.9% or dextrose 5% to yield a solution containing cangrelor 200 mcg/mL.<sup>3023</sup> The solution should be thoroughly mixed.<sup>3023</sup>

### Trade Name(s)

Kengreal

### Administration

Cangrelor tetrasodium is administered by rapid intravenous injection of a bolus dose followed by continuous intravenous infusion via a dedicated line.<sup>3023</sup> The bolus dose should be withdrawn from the bag containing the diluted drug and administered (by manual intravenous push or by pump) over less than 1 minute.<sup>3023</sup> The continuous intravenous infusion should immediately follow administration of the bolus.<sup>3023</sup>

### Stability

Intact vials of cangrelor tetrasodium should be stored at controlled room temperature.<sup>3023</sup> Cangrelor tetrasodium is a white to off-white lyophilized powder that forms a clear, colorless to pale yellow solution when reconstituted with sterile water for injection.<sup>3023</sup>

The manufacturer states that the reconstituted solution should be diluted immediately.<sup>3023</sup> The drug is noted to be stable for up to 12 hours at room temperature when diluted in dextrose 5% or up to 24 hours at room temperature if diluted in sodium chloride 0.9%.<sup>3023</sup> Any unused portion should be discarded.<sup>3023</sup>

## Carbamazepine

AHFS 28:12.92

### Products

Carbamazepine is available as a 10-mg/mL concentrate for injection in 20-mL single-dose vials.<sup>3318</sup> Each mL of the concentrate also contains betadex sulfobutyl ether sodium 250 mg and sodium phosphate monobasic dihydrate 0.78 mg in water for injection and may contain sodium hydroxide and/or hydrochloric acid for pH adjustment.<sup>3318</sup> The concentrate must be diluted prior to administration.<sup>3318</sup>

### pH

Carbamazepine 10-mg/mL concentrate for injection has an adjusted pH of 6.2.<sup>3318</sup>

### Trade Name(s)

Carnexiv

### Administration

Carbamazepine concentrate for injection is administered by intravenous infusion over 30 minutes following dilution

of the appropriate dose in 100 mL of a compatible infusion solution.<sup>3318</sup>

### Stability

Carbamazepine concentrate for injection is a clear, colorless solution.<sup>3318</sup> Intact vials should be stored at controlled room temperature.<sup>3318</sup> Vials are for single-dose only; any unused portion should be discarded.<sup>3318</sup>

Carbamazepine concentrate for injection diluted in a compatible infusion solution may be stored for 4 hours at 20 to 25°C or 24 hours at 2 to 8°C.<sup>3318</sup> Carbamazepine solution should be visually inspected prior to administration; if particulate matter is present or if cloudiness or discoloration occurs, the solution should be discarded.<sup>3318</sup>

# Carboplatin

## AHFS 10:00

### Products

Carboplatin is available as a 10-mg/mL aqueous solution in 5-mL (50-mg), 15-mL (150-mg), 45-mL (450-mg), 60-mL (600-mg), and 100-mL (1-g) multidose vials.<sup>2939 2940</sup> In addition to water for injection, some products also contain mannitol 10 mg in each mL of solution.<sup>2939</sup>

### pH

A 1% (10-mg/mL) solution has a pH of 5 to 7.<sup>2939 2940</sup>

### Administration

Carboplatin usually is administered by intravenous infusion over a period of 15 minutes or longer.<sup>2939 2940</sup> The drug also has been administered as a continuous intravenous infusion over 24 hours.<sup>2939 2940</sup> Manufacturers state that carboplatin solution may be diluted in dextrose 5% or sodium chloride 0.9% to a concentration as low as 0.5 mg/mL for administration.<sup>2939 2940</sup>

Because of an interaction occurring between carboplatin and aluminum (resulting in precipitate formation and loss of drug potency), only administration equipment (e.g., needles, intravenous sets) that does *not* contain aluminum should be used for the preparation or administration of this drug.<sup>2939 2940</sup>

### Stability

Intact vials should be stored at controlled room temperature and protected from light.<sup>2939 2940</sup>

Manufacturers state that reconstituted solutions are stable for 8 hours at room temperature (25°C).<sup>2939 2940</sup> Because no antibacterial preservative is present, the manufacturers recommend that carboplatin solutions for infusion be discarded 8 hours after dilution.<sup>2939 2940</sup> However, other information indicates that the drug may be stable for a much longer time. At a concentration of 15 mg/mL in sterile water for injection or at concentrations of 0.5 and 2 mg/mL in dextrose 5%, no decomposition occurred in 24 hours at 22 to 25°C.<sup>234</sup>

Formation of cisplatin in solutions of carboplatin 1 mg/mL in sodium chloride 0.9% at 25°C with exposure to fluorescent light

was evaluated. Less than 0.1% of the carboplatin had converted to cisplatin in 2 hours, and 0.7% had converted in 24 hours.<sup>1695</sup>

Carboplatin 1 mg/mL in sterile water for injection was reported to exhibit less than 10% loss in 14 days at room temperature.<sup>1379</sup>

Carboplatin (Bristol-Myers Oncology) 1 mg/mL in sterile water for injection was stable in polyvinyl chloride (PVC) reservoirs (Parker Micropump) for 14 days at 4 and 37°C, exhibiting no loss.<sup>1696</sup>

Manufacturers state that carboplatin 10 mg/mL aqueous injection in multidose vials is stable for up to 14 days at 25°C, even with multiple needle entries.<sup>2939 2940</sup>

### pH Effects

The pH range of maximum stability has been reported to be pH 4 to 6<sup>1919</sup> or 6.5.<sup>1369</sup> The degradation rate increases above pH 6.5.<sup>1369</sup>

### Syringes

Carboplatin 10-mg/mL aqueous solution prefilled into plastic syringes exhibited no decomposition in 5 days at 4°C and only 3% loss in 24 hours at 37°C.<sup>1238</sup>

Carboplatin 10 mg/mL (Bristol-Myers Squibb) was repackaged into 30-mL polypropylene syringes for use in the Intelliject portable syringe pump. The carboplatin solution exhibited no visual changes, and no loss of carboplatin content was found when stored at 25°C for 8 days. No evidence of interaction between carboplatin and the syringe plastic was identified, and no impact on the functioning of the syringe pump was observed.<sup>2147</sup>

### Sorption

Carboplatin (Ribosepharm) 0.72 mg/mL in dextrose 5% exhibited little or no loss due to sorption in polyethylene and PVC containers compared to glass containers over 72 hours at room and refrigeration temperatures.<sup>2420 2430</sup> Simulated infusion of carboplatin 10 mg/mL through a Silastic catheter over 24 hours at 37°C did not affect the delivered drug concentration.<sup>1238</sup>

## Carmustine (BCNU)

### AHFS 10:00

### Products

Carmustine is available in vials containing 100 mg of drug, packaged with a vial containing 3 mL of dehydrated alcohol injection, USP, for use as a diluent.<sup>1(8/07)</sup>

Dissolve the contents of the vial of carmustine with 3 mL of dehydrated alcohol injection, USP. Further dilute with 27 mL of sterile water for injection. The resultant solution will contain 3.3 mg/mL of carmustine in 10% ethanol.<sup>1(8/07)</sup>

Avoid accidental contact of the reconstituted solution with the skin. Transient hyperpigmentation in the affected areas has occurred.<sup>1(8/07)</sup> 4

### Trade Name(s)

BiCNU

### Administration

Carmustine is administered as an intravenous infusion over one to two hours. Shorter durations may result in pain and burning at the injection site and flushing.<sup>1(8/07)</sup> 4

### Stability

The product consists of vacuum-dried pale yellow flakes or is a congealed mass. Intact vials are stored under refrigeration and are stable for at least three years.<sup>1(8/07)</sup> Intact vials are stable for seven days at room temperatures not exceeding 25°C.<sup>1181 1236 1433</sup> Room temperature storage of intact vials results in slow decomposition, with approximately 3% degradation occurring in 36 days.<sup>285</sup>

Reconstitution as directed results in a colorless to pale yellow solution. This solution is stable for eight hours at room temperature protected from light.<sup>4</sup> About a 6% loss occurs in three hours and about an 8% loss occurs in six hours.<sup>285</sup> A loss of 20% in 21 hours was also reported.<sup>484</sup>

Refrigeration of the solution significantly increases its stability. In 24 hours at 2 to 8°C with protection from light, approximately 4% decomposition occurs.<sup>1(8/07)</sup> 285

Carmustine has a melting point of approximately 30.5 to 32°C. At this temperature, the drug liquifies, becoming an oily film on the bottom of the vial. Should this occur, the manufacturer recommends that the vials be discarded, because the melting is a sign of decomposition.<sup>1(8/07)</sup> However, one study showed that storage of the vials at 37°C for 15 minutes followed by storage at 22 to 25°C resulted in no decomposition in eight

days and about an 8% loss in 37 days. Storage of the vials at 37°C for seven days resulted in about 10% decomposition.<sup>862</sup>

In 95% ethanol, carmustine 2 mg/mL is reported to be stable for at least 24 hours at 22 to 25 and 37°C.<sup>862</sup> Under refrigeration, carmustine 0.5 to 0.6 mg/mL in 95% ethanol or absolute ethanol is stable at 0 to 5°C for up to three months.<sup>863</sup>

### pH Effects

The degradation rate for carmustine in aqueous solution was reported to be at a minimum between pH 5.2 and 5.5<sup>619</sup> and 3.3 and 4.8.<sup>1237</sup> Above pH 6, the degradation rate increases greatly.<sup>619</sup> Decomposition of 10% occurred in less than two hours at pH 6.5 but in 5.5 hours at optimum pH.<sup>1237</sup>

### Light Effects

Increased decomposition rates were reported when carmustine, in solution, was exposed to increasing intensities of light.<sup>1237</sup> However, in another study, no clear effect on rate of carmustine loss from exposure to light was demonstrated. Some samples seemed to demonstrate increased rate of loss due to light exposure while others did not.<sup>2337</sup>

### Sorption

The manufacturer recommends the use of glass containers for carmustine administration.<sup>1(8/07)</sup> 4 The rate of loss of carmustine from infusion admixtures in dextrose 5% in PVC containers is substantially greater than the rate of loss in glass<sup>519 1237 1658 2430</sup> or polyolefin<sup>1237 1658</sup> containers.

Substantial loss to PVC, ethylene vinyl acetate, and polyurethane infusion sets was also noted. Only a set lined with polyethylene proved resistant to carmustine sorption, resulting in little loss in two hours.<sup>1237</sup>

Carmustine (Bristol-Myers Squibb) 0.2 mg/mL in dextrose 5% was evaluated for loss of drug content in glass, polyethylene, and PVC containers. At room temperature, about 40% loss of drug occurred in glass containers in 72 hours. In polyethylene containers, a slightly larger loss occurred, about 50% loss in 72 hours. The greatest loss occurred in PVC containers with about 65% loss in 72 hours. Carmustine losses of 5% occurred in 5.5 hours, 2.5 hours, and 45 minutes in glass, polyethylene, and PVC containers, respectively. The increased losses in polyethylene and PVC containers were attributed to sorption. Under refrigeration, glass and polyethylene containers were similar with less than 10% loss in 72 hours. However, in PVC containers about 20% loss due to sorption occurred in that time frame.<sup>2420 2430</sup>

# Caspofungin Acetate

**AHFS 8:14.16**

## Products

Caspofungin acetate is available in 2 different formulations.<sup>3344 3345 3346</sup> In addition to varying inactive ingredients, the formulations differ in their storage requirements.<sup>3344 3345 3346</sup>

Caspofungin acetate (Cancidas, Merck; generic) is available as a lyophilized powder or cake in single-dose vials containing 50 or 70 mg of caspofungin.<sup>3344 3346</sup> The 50-mg vial also contains sucrose 39 mg and mannitol 26 mg.<sup>3344 3346</sup> The 70-mg vial also contains sucrose 54 mg and mannitol 36 mg.<sup>3344 3346</sup> Both vial sizes contain glacial acetic acid and sodium hydroxide to adjust the pH.<sup>3344 3346</sup> The 50- and 70-mg vials contain an overfill of caspofungin (4.6 and 5.6 mg, respectively) to permit withdrawal of a full 50- or 70-mg dose of the reconstituted product.<sup>3344 3346</sup>

Caspofungin acetate (Fresenius Kabi) is available as a lyophilized powder or cake in single-dose vials containing 50 or 70 mg of caspofungin.<sup>3345</sup> The 50- and 70-mg vials also contain arginine 100 and 140 mg, respectively.<sup>3345</sup> Both vial sizes contain hydrochloric acid and/or sodium hydroxide to adjust the pH.<sup>3345</sup> The 50- and 70-mg vials contain an overfill of caspofungin (4.6 and 7.2 mg, respectively) to permit withdrawal of a full 50- or 70-mg dose of the reconstituted product.<sup>3345</sup>

To prepare a solution of caspofungin for intravenous infusion, vials of caspofungin acetate that have been stored under refrigeration should be allowed to come to room temperature prior to reconstitution.<sup>3344 3346</sup> Both the 50- and 70-mg vials should be reconstituted with 10.8 mL of sterile water for injection, sodium chloride 0.9%, or bacteriostatic water for injection (containing methyl- or propylparabens or benzyl alcohol 0.9%) and should be mixed gently until the powder or cake has completely dissolved and a clear solution forms.<sup>3344 3345 3346</sup> The resulting caspofungin concentrations of the reconstituted solutions prepared from the 50- and 70-mg vials are 5 and 7 mg/mL, respectively.<sup>3344 3345 3346</sup> To prepare doses intended for pediatric patients, manufacturers recommend use of the 50-mg vial for doses less than or equal to 50 mg; the 70-mg vial should be reserved for pediatric doses exceeding 50 mg.<sup>3344 3345 3346</sup>

The reconstituted caspofungin solution should be diluted for infusion within 1 hour after reconstitution.<sup>3344 3345 3346</sup> The appropriate volume of the reconstituted solution should be withdrawn from the vial and transferred to a 250-mL bag or bottle of sodium chloride 0.9%, sodium chloride 0.45%, sodium chloride 0.225%, or Ringer's injection, lactated.<sup>3344 3345 3346</sup>

Alternatively, the appropriate volume of the reconstituted solution may be added to a smaller volume of these infusion solutions for a final caspofungin concentration not exceeding 0.5 mg/mL.<sup>3344 3345 3346</sup> Reconstituted and diluted solutions should be visually inspected for particulate matter and discoloration; if the solution has precipitated or if cloudiness occurs, the solution should not be used.<sup>3344 3345 3346</sup>

## pH

The pH of a saturated aqueous solution of caspofungin is approximately 6.6.<sup>3344 3345 3346</sup>

## Osmolality

Caspofungin acetate diluted as directed for infusion is near isotonicity.<sup>2722</sup>

## Trade Name(s)

Cancidas

## Administration

Caspofungin acetate is administered by slow intravenous infusion over approximately 1 hour.<sup>3344 3345 3346</sup> Caspofungin acetate should *not* be administered by intravenous bolus.<sup>3344 3345 3346</sup>

## Stability

Caspofungin acetate is available as a lyophilized white to off-white cake or powder that forms a clear solution upon reconstitution.<sup>3344 3345 3346</sup> Intact vials of caspofungin acetate (Cancidas, Merck; generic) should be stored at 2 to 8°C.<sup>3344 3346</sup> Intact vials of caspofungin acetate (Fresenius Kabi) should be stored at controlled room temperature.<sup>3345</sup> Vials are for single use only; unused portions should be discarded.<sup>3344 3345 3346</sup>

The reconstituted solution may be stored for up to 1 hour after reconstitution at room temperature up to 25°C, but should be withdrawn within 1 hour after reconstitution to prepare the intravenous infusion solution.<sup>3344 3345 3346</sup>

The diluted solution for infusion in the intravenous bag or bottle must be used within 24 hours if stored at room temperature up to 25°C or within 48 hours if stored at 2 to 8°C.<sup>3344 3345 3346</sup>

Caspofungin acetate is unstable in dextrose-containing solutions; such solutions should not be used for reconstitution or dilution of the drug.<sup>3344 3345 3346</sup> The manufacturers recommend that caspofungin acetate not be mixed with or co-infused with other drugs.<sup>3344 3345 3346</sup>

## Compatibility Information

### Solution Compatibility

#### Caspofungin acetate

Test Soln Name	Mfr	Mfr	Conc/L or %	Remarks	Ref	C/I

## Cefazolin Sodium

AHFS 8:12.06.04

### Products

Cefazolin as the sodium salt is available in 500-mg and 1-, 10-, and 20-g vials. For intramuscular administration, reconstitute the 500-mg vial with 2 mL and the 1-g vial with 2.5 mL and shake well until dissolved, yielding 225 and 330 mg/mL, respectively. Sterile water for injection or bacteriostatic water for injection may be used for either the 500-mg or 1-g vials while sodium chloride 0.9% only may be used for the 500-mg vial.<sup>1(4/08) 4</sup>

For direct intravenous injection, further dilute the reconstituted cefazolin sodium with approximately 5 mL of sterile water for injection.<sup>1(4/08) 4</sup>

For intermittent intravenous infusion, reconstituted cefazolin sodium should be diluted further in 50 to 100 mL of compatible infusion solution.<sup>1(4/08) 4</sup>

The 10-g bulk vials may be reconstituted with sterile water for injection, bacteriostatic water for injection, or sodium chloride 0.9%. The 10-g vial should be reconstituted with 45 or 96 mL to yield concentrations of 1 g/5 mL or 1 g/10 mL, respectively.<sup>1(4/08)</sup>

Cefazolin sodium (Braun) is available as 1 g in a dual-chamber flexible container. The diluent chamber contains dextrose solution.<sup>1(4/08)</sup>

Cefazolin sodium is also available frozen in polyvinyl chloride (PVC) bags in concentrations of 500 mg and 1 g in 50 mL of dextrose 5%.<sup>4</sup>

### pH

From 4.5 to 6. The frozen premixed solutions have a pH of 4.5 to 7.<sup>4</sup>

### Osmolality

The osmolality of a 225-mg/mL solution in sterile water for injection was determined to be 636 mOsm/kg by freezing-point depression.<sup>1071</sup>

The osmolality of cefazolin sodium 1 and 2 g was calculated for the following dilutions:<sup>1054</sup>

Diluent	Osmolality (mOsm/kg)	
	50 mL	100 mL
1 g		
Dextrose 5%	321	291
Sodium chloride 0.9%	344	317
2 g		
Dextrose 5%	379	324
Sodium chloride 0.9%	406	351

Cefazolin sodium (Braun) 1 g in dual-chamber flexible containers has an osmolality of 290 mOsm/kg when activated with the dextrose solution diluent.<sup>1(4/08)</sup>

The frozen premixed solutions have osmolalities of 260 to 320 mOsm/kg for the 500 mg/50-mL concentration and 310 to 380 mOsm/kg for the 1-g/50-mL concentration.<sup>4</sup>

The following maximum cefazolin sodium concentrations were recommended to achieve osmolalities suitable for peripheral infusion in fluid-restricted patients.<sup>1180</sup>

Diluent	Maximum Concentration (mg/mL)	Osmolality (mOsm/kg)
Dextrose 5%	77	507
Sodium chloride 0.9%	69	494
Sterile water for injection	138	404

### Sodium Content

Each gram of cefazolin sodium contains 48 mg or approximately 2 mEq of sodium.<sup>1(4/08) 4</sup>

### Administration

Cefazolin sodium may be administered by deep intramuscular injection or by intravenous injection. By direct intravenous injection, it is given over 3 to 5 minutes directly into the vein or tubing of a running infusion solution. It may also be given by intermittent infusion in 50 to 100 mL of compatible diluent or by continuous infusion.<sup>1(4/08)</sup>

### Stability

Intact containers of the sterile powder should be stored at controlled room temperature. Reconstituted solutions of cefazolin sodium are light yellow to yellow. Protection from light is recommended for both the powder and its solutions.<sup>1(4/08) 4</sup>

The manufacturer recommends that solutions of cefazolin sodium be discarded after 24 hours at room temperature or 10 days under refrigeration.<sup>1(4/08)</sup> This recommendation is made to reduce the potential for the growth of microorganisms and to minimize an increase in color and a change in pH.<sup>276</sup> A test of cefazolin sodium 250 mg/mL in water for injection showed that the drug lost less than 3% in 14 days at 5°C. A loss of 8 to 10% was noted in 4 days at 25°C.<sup>276</sup>

Cefazolin sodium (Braun) 1 g in dual-chamber flexible plastic containers with dextrose solution diluent should be used within 24 hours after activation if stored at room temperature and in 7 days if stored under refrigeration.<sup>1(4/08)</sup>

## Crystallization

Crystal formation has also been observed in reconstituted cefazolin sodium 330 mg/mL stored at room temperature after complete dissolution when sodium chloride 0.9% is the diluent. The crystals formed initially are fine and may be easily overlooked. At 330 mg/mL, cefazolin sodium is near its saturation point, and the room temperature and ionic content of the diluent are important for maintaining the drug in solution. In an evaluation of cefazolin sodium reconstituted with 2.5 mL of either sodium chloride 0.9% or sterile water for injection and stored at 24 or 26°C, none of the vials reconstituted with sterile water for injection formed crystals within 24 hours. However, when sodium chloride 0.9% was the diluent, all vials had crystals. Consequently, sterile water for injection was recommended as the diluent when possible.<sup>875</sup> The crystals of cefazolin sodium can be redissolved by hand-warming the vials or by immersion in a 35°C water bath for 2 minutes. The clear solution will then be suitable for use.<sup>1075</sup>

## pH Effects

Cefazolin sodium solutions are relatively stable at pH 4.5 to 8.5. Above pH 8.5, rapid hydrolysis of the drug occurs. Below pH 4.5, precipitation of the insoluble free acid may occur.<sup>4 284</sup>

Cefazolin sodium in solutions containing dextrose, fructose, sucrose, dextran 40 or 70, mannitol, sorbitol, or glycerol in concentrations up to 15% was most stable at pH 5 to 6.5. At neutral and alkaline pH, the rate of degradation was accelerated by the carbohydrates and alcohols.<sup>820</sup>

Cefazolin sodium 3.33 mg/mL was evaluated in several aqueous buffer solutions. The drug was most stable in pH 4.5 acetate buffer, exhibiting 10% decomposition in 3 days at 35°C and in 5 days at 25°C. In pH 5.7 acetate buffer, a 13% loss occurred in 3 days at 35°C and a 10% loss occurred in 5 days at 25°C. No loss occurred in either acetate buffer in 7 days at 4°C.<sup>1147</sup>

In pH 7.5 phosphate buffer, a yellow color and particulate matter developed after 3 to 4 days at 35°C. This change was accompanied by a 6% cefazolin loss in 1 day and an 18% loss in 3 days. At 25 and 4°C, 10 and 5% cefazolin losses occurred, respectively, in 5 days.<sup>1147</sup>

## Freezing Solutions

Solutions of cefazolin sodium 125, 225, and 330 mg/mL frozen in the original containers at -20°C immediately after reconstitution with sterile water for injection, bacteriostatic water for injection, or sodium chloride 0.9% are stated to be stable for 12 weeks. Thawed solutions are stable for 24 hours at room temperature or 10 days under refrigeration; they should not be refrozen.<sup>4</sup>

When reconstituted with water for injection, dextrose 5%, or sodium chloride 0.9% in concentrations of 1 g/2.5 mL, 500 mg/100 mL, and 10 g/45 mL, cefazolin sodium retained more than 90% potency for up to 26 weeks when frozen within 1 hour after reconstitution at -10 and -20°C. In a concentration of 500 mg/100 mL in dextrose 5% in Ringer's injection, lactated, Ionosol B in dextrose 5%, Normosol M in dextrose

5%, Plasma-Lyte in dextrose 5%, or Ringer's injection, lactated, cefazolin sodium was stable for up to 4 weeks when frozen within 1 hour after reconstitution at -10°C.<sup>277</sup>

In another study, cefazolin sodium (SKF) 1 g/50 mL of dextrose 5% and also sodium chloride 0.9% in PVC containers was frozen at -20°C for 30 days. The results indicate that potency was retained for the duration of the study.<sup>299</sup>

Cefazolin sodium (Lilly) 1 g/100 mL in dextrose 5% in PVC bags was frozen at -20°C for 30 days and then thawed by exposure to ambient temperature or microwave radiation. The solutions showed no evidence of precipitation or color change and showed no loss of potency as determined microbiologically. Subsequent storage of the admixture at room temperature for 24 hours also yielded a physically compatible solution which exhibited a 3 to 6% loss of potency.<sup>554</sup>

In an additional study, cefazolin sodium (Lilly and SKF) 10 mg/mL in 50, 100, and 250 mL of dextrose 5% and sodium chloride 0.9% in PVC bags was frozen at -20°C for 48 hours. Thawing was then performed by exposure to microwave radiation carefully applied so that the solution temperature did not exceed 20°C and so that a small amount of ice remained at the endpoint. This procedure avoids accelerated decomposition due to inadvertent excessive temperature increases. The solutions were stored for 4 hours at room temperature. Both brands of cefazolin sodium retained at least 90% of the initial activity as determined by microbiological assay. In addition, the solutions did not exhibit color changes or significant pH changes.<sup>627</sup>

An approximate fourfold increase in particles of 2 to 60 µm was produced by freezing and thawing cefazolin sodium (Lilly) 2 g/100 mL of dextrose 5% (Travenol). The reconstituted drug was filtered through a 0.45-µm filter into PVC bags of solution and frozen for 7 days at -20°C. Thawing was performed at room temperature (29°C) for 12 hours. Although the total number of particles increased significantly, no particles greater than 60 µm were observed; the solution complied with USP standards for particle sizes and numbers in large volume parenteral solutions.<sup>822</sup>

No loss of cefazolin sodium (SKF) was reported from a solution containing 73.2 mg/mL in sterile water for injection in PVC and glass containers after 30 days at -20°C. Subsequent thawing and storage for 4 days at 5°C, followed by 24 hours at 37°C to simulate the use of a portable infusion pump, also did not result in a cefazolin loss.<sup>1391</sup>

The manufacturer warns against continued heating of a completely thawed solution, which can result in accelerated drug decomposition and possibly dangerous pressure increases in the container.<sup>627</sup>

Cefazolin sodium (Braun) 1 g in dual-chamber flexible containers should not be frozen.<sup>1(4/08)</sup>

## Syringes

Cefazolin sodium (SKF) 1 and 2 g/10 mL in sterile water for injection, packaged in plastic syringes (Monoject), exhibited a 10% cefazolin loss in 13 days at 24°C. At 4°C, the drug exhibited less than a 10% loss during the 28-day study period. Frozen at -15°C, less than 10% drug loss occurred in 3 months.<sup>1178</sup>

Cefazolin sodium (Apothecon) 50 mg/mL in sodium chloride 0.9% was packaged in 5-mL polypropylene syringes (Becton Dickinson) and stored at 23 and 5°C. About 10% loss was found after 12 days of storage at 23°C. About 3% loss was found after 22 days of refrigerated storage.<sup>2474</sup>

Cefazolin sodium (Apotex) 100 and 200 mg/mL in sterile water for injection was packaged in polypropylene syringes and stored at 5°C protected from light.<sup>2986</sup> A slight increase in yellow discoloration of the solution occurred with less than 10% loss in 30 days at 5°C with light protection followed by 72 hours at 21 to 25°C with light exposure.<sup>2986</sup>

**Filtration**

Cefazolin sodium (SKF) 10 g/L in dextrose 5% and also in sodium chloride 0.9% was filtered through 0.45- and 0.22-µm Millipore membrane filters at time zero and at 4, 8, and 24 hours after mixing. No significant difference in concentration occurred between any of the filtered samples compared to unfiltered solutions at these time intervals. It was concluded that filtra-

tion of cefazolin sodium solutions through these membrane filters could be performed without adversely affecting the drug concentration.<sup>375</sup>

**Central Venous Catheter**

Cefazolin sodium (SmithKline Beecham) 5 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

Cefazolin sodium 10 mg/mL with heparin sodium 5000 units/mL as an antibiotic lock in polyurethane central hemodialysis catheters lost about 50% of the antibiotic over 72 hours at 37°C. The loss was attributed to sorption to the catheters. Nevertheless, the reduced antibiotic concentration (about 5 mg/mL) remained effective against common microorganisms in catheter-related bacteremia in hemodialysis patients.<sup>2515 2516</sup>

<sup>a</sup> Tested in dextrose 5%.

<sup>b</sup> Tested in sodium chloride 0.9%.

<sup>c</sup> Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>d</sup> Tested in dextrose 5%, Ringer's injection, lactated, sodium chloride 0.45%, and sodium chloride 0.9%.

<sup>e</sup> Tested as the premixed infusion solution.

<sup>f</sup> Lyophilized formulation tested.

<sup>g</sup> Refer to Appendix for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>h</sup> A 32.5-mL sample of parenteral nutrition solution combined with 50 mL of antibiotic solution.

<sup>i</sup> Run at 21 mL/hr.

<sup>j</sup> Given over five minutes by syringe pump.

<sup>k</sup> Run at 94 mL/hr.

<sup>l</sup> Tested in sterile water for injection.

<sup>m</sup> Test performed using the formulation WITHOUT edetate disodium.

<sup>n</sup> Tested in either dextrose 5% or in sodium chloride 0.9%, but the report did not specify which solution.

<sup>o</sup> Tested in a 1:1 mixture of (1) dextrose 5% and dextrose 5% in sodium chloride 0.45% with and without potassium chloride 20 mEq/L and also in (2) dextrose 10% in sodium chloride 0.45% with and without potassium chloride 20 mEq/L.

<sup>p</sup> Tested in a 1:1 mixture of dextrose 5% and TPN #274 (see Appendix).

<sup>q</sup> Cefotolozane component. Cefotolozane in a 2:1 fixed-ratio concentration with tazobactam.

<sup>r</sup> Meropenem component. Meropenem in a 1:1 fixed-ratio concentration with vaborbactam.

<sup>s</sup> Test performed using the formulation WITH edetate disodium.

## Additional Compatibility Information

### Peritoneal Dialysis Solutions

The stability of cefazolin sodium 75 and 150 mg/L, alone and with gentamicin sulfate 8 mg/L, was evaluated in a peritoneal dialysis solution of dextrose 1.5% with heparin sodium 1000 units/L. Cefazolin activity was retained for 48 hours at both 4 and 26°C at both concentrations, alone and with gentamicin. Gentamicin activity also was retained over the study period. At 37°C, however, cefazolin losses were greater, with about a 10 to 12% loss occurring in 48 hours. Gentamicin losses ranged from 4 to 8% in this time period.<sup>1029</sup>

Gentamicin 4 mcg/mL in Dianeal PDS with dextrose 1.5 and 4.25% (Travenol) was evaluated with cefazolin sodium 125 mcg/mL, heparin 500 units, and albumin 80 mg in 2-L bags. The gentamicin content was retained for 72 hours.<sup>1413</sup>

The stability of cefazolin sodium (Lilly) 0.5 mg/mL in Dianeal PD-1 with dextrose 1.5 and 4.25% (Travenol) was studied. The drug was stable, exhibiting losses of 10.5% or less in 14 days at 4°C, 8 days at 25°C, and 24 hours at 37°C. However, losses of 11.7 and 14.6% occurred in the solutions containing dextrose 1.5% and dextrose 4.25%, respectively, in 11 days at 25°C.<sup>1480</sup>

Cefazolin sodium (Lilly) 125 mcg/mL combined separately with the aminoglycosides amikacin sulfate (Bristol), gentamicin sulfate (Schering), and tobramycin sulfate (Lilly) at a concentration of 25 mcg/mL in peritoneal dialysis solution (Dianeal 1.5%) exhibited enhanced rates of lethality to *Staphylococcus aureus*, *Escherichia coli*, and *Pseudomonas aeruginosa* compared to any of the drugs alone.<sup>1623</sup>

Cefazolin sodium (Fujisawa) 0.333 mg/mL in PD-2 with dextrose 1.5% (Baxter) peritoneal dialysis solution with and without heparin sodium 1000 units/1.5 L was stored at 4, 25, and 37°C. No visible changes occurred, and less than 10% loss of cefazolin occurred in 20 days at 4°C, 11 days at 25°C, and 24 hours at 37°C.<sup>2388</sup>

Cefazolin sodium (Fujisawa) 0.5 mg/mL in Extraneal PD (Baxter) containing 7.5% icodextrin was physically compatible and chemically stable for 30 days at 4°C with about 7% cefazolin loss and for 7 days at room temperature with about 9% loss. At 37°C, 8% cefazolin loss occurred in 24 hours.<sup>2480</sup>

Cefazolin sodium 125 and 500 mg/mL (Apothecon) was evaluated for stability at 38°C in Dianeal PD-2 with dextrose 1.5, 2.5, and 4.25% and in Extraneal 7.5% with and without added heparin. Less than 10% loss occurred in 48 hours and 10 to 14% loss in 60 hours.<sup>2655</sup>

Cefazolin sodium (Hospira) 500 mg/L in Extraneal with icodextrin 7.5% (Baxter) peritoneal dialysis solution bags exhibited less than 10% loss in 14 days at 4°C, 7 days at 25°C, and 6 hours at 37°C.<sup>3537</sup> Cefazolin sodium (Hospira) 500 mg/L with gentamicin sulfate (Pfizer) 20 mg/L in Extraneal with icodextrin 7.5% (Baxter) peritoneal dialysis solution bags exhibited less than 10% loss of either drug in 14 days at 4°C, 7% loss of cefazolin and no loss of gentamicin in 4 days at 25°C, and 5%

loss of cefazolin and 1% loss of gentamicin in 1 day at 37°C.<sup>3537</sup> Cefazolin sodium (Hospira) 500 mg/L with ceftazidime (Sandoz) 500 mg/L in Extraneal with icodextrin 7.5% (Baxter) peritoneal dialysis solution bags exhibited less than 10% loss of either drug in 14 days at 4°C, 2% loss of cefazolin and 6% loss of ceftazidime in 2 days at 25°C, and 2% loss of cefazolin and no loss of ceftazidime in 6 hours at 37°C.<sup>3537</sup>

# Cefepime Hydrochloride

AHFS 8:12.06.16

## Products

Cefepime hydrochloride is available as 1 and 2 g of cefepime in vials.<sup>3295</sup> The drug also may be available in a 500-mg vial.<sup>3295 3324</sup>

The products contain L-arginine in an approximate concentration of 707 mg/g of cefepime to control the pH of the reconstituted solution.<sup>3295</sup>

For intramuscular administration, reconstitute the 500-mg and 1-g vials with 1.3 and 2.4 mL, respectively, of sterile water for injection, sodium chloride 0.9%, dextrose 5%, lidocaine hydrochloride 0.5 or 1%, or bacteriostatic water for injection preserved with parabens or benzyl alcohol to yield a solution with a cefepime concentration of 280 mg/mL.<sup>3295</sup>

For intravenous injection, reconstitute the 500-mg and 1-g vials with 5 and 10 mL, respectively, of a compatible diluent to yield a solution with a cefepime concentration of 100 mg/mL; reconstitute the 2-g vial with 10 mL of a compatible diluent to yield a solution with a cefepime concentration of 160 mg/mL.<sup>3295</sup> The reconstituted solutions should be added to compatible intravenous solutions for intermittent intravenous infusion.<sup>3295</sup>

Cefepime hydrochloride also is available as 1 and 2 g of cefepime in ADD-Vantage vials.<sup>3295</sup> Each ADD-Vantage vial also contains L-arginine in an approximate concentration of 707 mg/g of cefepime.<sup>3295</sup> ADD-Vantage vials of cefepime hydrochloride should be prepared with 50 or 100 mL of dextrose 5% or sodium chloride 0.9% in ADD-Vantage diluent bags.<sup>3295</sup>

Cefepime hydrochloride is available as 1 and 2 g of cefepime in a dual-chamber flexible container.<sup>3297</sup> The drug chamber also contains L-arginine in an approximate concentration of 725 mg/g of cefepime.<sup>3297</sup> The diluent chamber contains approximately 50 mL of dextrose 5% for use as a diluent.<sup>3297</sup>

Cefepime is available in 1- and 2-g sizes as a frozen premixed solution in 50- and 100-mL bags, respectively.<sup>3296</sup> Approximately 1.03 or 2.06 g of dextrose hydrous has been added to the 50- or 100-mL bags, respectively, to adjust the osmolality.<sup>3296</sup> The frozen premixed solution also contains L-arginine in an approximate concentration of 725 mg/g of cefepime with or without hydrochloric acid in water for injection for intravenous infusion.<sup>3296</sup>

## pH

The pH of the reconstituted solution and the frozen premixed solution ranges from 4 to 6.<sup>3295 3296 3297</sup>

## Osmolality

Cefepime 1 and 2 g in dual-chamber flexible containers has an approximate osmolality of 431 and 577 mOsm/kg, respectively, when activated with the dextrose solution diluent.<sup>3297</sup>

Frozen premixed solutions of cefepime are iso-osmotic.<sup>3296</sup>

## Trade Name(s)

Maxipime

## Administration

Cefepime hydrochloride is administered by intermittent intravenous infusion over approximately 30 minutes;<sup>3295 3296 3297</sup> the manufacturer states that the drug also can be given by intramuscular injection for certain indications.<sup>3295</sup>

## Stability

Intact vials of cefepime hydrochloride should be stored at controlled room temperature and protected from light.<sup>3295</sup> Reconstituted solutions may vary from pale yellow to amber.<sup>3295</sup> Both the powder and reconstituted solutions may darken during storage like other cephalosporins.<sup>3295 3297</sup> In one study, solutions of cefepime in sterile water for injection at concentrations greater than 50 g/L underwent marked color changes (i.e., from light yellow to dark red) in 2 hours at 37°C.<sup>3105</sup> When stored as recommended, the drug is not adversely affected.<sup>3295 3279</sup>

Reconstituted solutions of cefepime hydrochloride in compatible diluents are stable for 24 hours at room temperatures of 20 to 25°C and for 7 days under refrigeration at 2 to 8°C.<sup>3295</sup> Cefepime 1 and 2 g in dual-chamber flexible plastic containers with dextrose solution diluent should be used within 12 hours after activation if stored at room temperature and in 5 days if stored under refrigeration.<sup>3297</sup>

## pH Effects

Cefepime hydrochloride is most stable at pH values in the range of 4 to 5. At higher pH values, cefepime hydrochloride is less stable. Cefepime hydrochloride decomposition results in alkaline degradation products, which may increase the rate of loss.<sup>2513 2514 2515</sup>

## Freezing Solutions

The commercially available frozen injection should be thawed at room temperature of 25°C or under refrigeration at 5°C; solutions should not be subject to force thawing by immersion in water baths or microwaving.<sup>3296</sup> The manufacturer indicates that the thawed solution is stable for 24 hours at room temperature of 25°C or 7 days under refrigeration at 5°C.<sup>3296</sup> Thawed solutions should not be refrozen.<sup>3296</sup>

## Syringes

Cefepime (Bristol-Myers Squibb) 100 and 200 mg/mL in dextrose 5%, sodium chloride 0.9%, and sterile water for injection was packaged as 10 mL of solution in 10-mL polypropylene syringes and capped (Becton Dickinson). The samples were stored frozen at -20°C for 90 days and were also tested without having been frozen. The solutions remained stable for up to 14

days refrigerated at 4°C, losing 10% or less of the cefepime. In samples stored at room temperature of about 23°C, less than 10% loss occurred in 1 day in most cases, but losses as high as 13% occurred in 2 days in some (but not all) samples that were evaluated.<sup>2220 2221</sup> Samples refrigerated up to 5 days followed by room temperature storage exhibited similar stability, exhibiting less than 10% loss in 1 day but higher losses after 2 days.<sup>2220</sup>

Cefepime (Bristol-Myers Squibb) 20 mg/mL in sodium chloride 0.9% was packaged in 10-mL polypropylene syringes (Becton Dickinson) and stored at 25 and 5°C. The drug solutions remained clear, but the color deepened to a darker yellow during storage at room temperature. About 5% loss occurred in 2 days and 11% loss in 4 days at 25°C. About 3% loss was found

after 21 days at 5°C. The losses were comparable to the drug solution stored in a glass flask, indicating sorption to syringe components did not occur.<sup>2341</sup>

### Central Venous Catheter

Cefepime (Bristol-Myers Squibb) 5 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Delivery of the cefepime hydrochloride ranged from 92 to 95% of the initial concentration among the 3 lumens. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

## Additional Compatibility Information

### Peritoneal Dialysis Solutions

Cefepime (Bristol-Myers Squibb) 0.125 and 0.25 mg/mL in Inpersol peritoneal dialysis solution with dextrose 4.25% is stable, exhibiting 3% loss in 7 days at 5°C, 2% loss in 24 hours at room temperature, and 8% loss in 24 hours at 37°C.<sup>1682</sup>

Cefepime (Bristol-Myers Squibb) 0.1 mg/mL in Delflex solution with dextrose 1.5% stored at various temperatures was evaluated for physical and chemical stability. No visible particulates or changes in color or clarity were observed in any sample. Cefepime exhibited no loss in 14 days at 4°C, 7% loss in 7 days at 25°C, and 4% loss in 24 hours and 9% loss in 48 hours at body temperature.<sup>2283</sup>

Cefepime (Bristol-Myers Squibb) 0.48 mg/mL was found to exhibit less than 10% loss in icodextrin 7.5% peritoneal dialysis

solution (Extraneal) after 7 days at refrigerator temperature, 2 days at room temperature, and 4 hours at 37°C.<sup>2616</sup>

Cefepime hydrochloride was evaluated for stability in pH-neutral Balance with dextrose 1.5% (Fresenius).<sup>3270</sup> Bags of 2-compartment pH-neutral Balance with 1.5% dextrose contained cefepime 250 mg/L in the non-dextrose (i.e., buffer solution) compartment for storage at 4 and 25°C; for bags intended for storage at 37°C, the initial concentration of cefepime in the non-dextrose compartment also was 250 mg/L; however, the 2 compartments were combined immediately prior to storage at 37°C for a final cefepime concentration of 125 mg/L.<sup>3270</sup> No color change or precipitation was noted on visual assessment and no meaningful pH changes occurred.<sup>3270</sup> Less than 10% loss of cefepime occurred in 7 days at 4°C, 3 days at 25°C, and 12 hours at 37°C.<sup>3270</sup>

# Cefiderocol Sulfate Tosylate

AHFS 8:12.06.28

## Products

Cefiderocol sulfate tosylate is available as a lyophilized powder in single-dose vials containing the equivalent of 1 g of cefiderocol.<sup>3531</sup> Each vial also contains sucrose 900 mg, sodium chloride 216 mg, and sodium hydroxide to adjust the pH.<sup>3531</sup>

The contents of each 1-g vial of cefiderocol should be reconstituted with 10 mL of sodium chloride 0.9% or dextrose 5% and the vial should be shaken gently to dissolve the powder.<sup>3531</sup> Vials should be allowed to stand until any foam that has been generated on the surface has disappeared (usually about 2 minutes).<sup>3531</sup> The reconstituted solution must be diluted prior to infusion.<sup>3531</sup>

The manufacturer's instructions for preparing various doses of cefiderocol from the reconstituted solution are as follows:<sup>3531</sup>

For a 2-g dose, withdraw the entire contents of 2 vials (i.e., approximately 11.2 mL per vial).

For a 1.5-g dose, withdraw the entire contents of 1 vial (i.e., approximately 11.2 mL) and 5.6 mL from a second vial.

For a 1-g dose, withdraw the entire contents of 1 vial (i.e., approximately 11.2 mL).

For a 0.75-g dose, withdraw 8.4 mL from 1 vial.

All doses should then be added to an infusion bag containing 100 mL of sodium chloride 0.9% or dextrose 5%.<sup>3531 3544</sup>

## pH

The pH of the resulting solution that forms when 1 g of cefiderocol is dissolved in 10 mL of water is within the range of 5.2 to 5.8.<sup>3531</sup>

## Equivalency

Cefiderocol sulfate tosylate 1.6 g is equivalent to 1 g of cefiderocol.<sup>3531</sup>

## Sodium Content

Each 1-g vial of cefiderocol contains approximately 176 mg of sodium.<sup>3531</sup>

## Trade Name(s)

Fetroja

## Administration

Cefiderocol sulfate tosylate is administered by intravenous infusion over 3 hours following reconstitution and further dilution.<sup>3531</sup>

## Stability

Cefiderocol sulfate tosylate is a white to off-white powder that forms a clear, colorless solution upon reconstitution and dilution.<sup>3531</sup> Intact vials of cefiderocol sulfate tosylate should be stored at 2 to 8°C in the original carton until time of use to protect from light.<sup>3531</sup>

After reconstitution with an appropriate diluent as instructed, the drug may be stored for up to 1 hour at room temperature.<sup>3531</sup> Following dilution, the drug is stable for 4 hours at room temperature.<sup>3531</sup>

# Cefotaxime Sodium

AHFS 8:12.06.12

## Products

Cefotaxime sodium is available in vials containing the equivalent of 500 mg and 1 and 2 g of cefotaxime (as sodium) and in infusion bottles containing the equivalent of 1 g of cefotaxime (as sodium). It is also available in 10- and 20-g pharmacy bulk packages.<sup>1(9/08)</sup>

For intravenous administration, the contents of any size vial may be reconstituted with 10 mL of sterile water for injection. (See Table 1.) The 1- and 2-g infusion bottles may be reconstituted with 50 or 100 mL of dextrose 5% or sodium chloride 0.9%. For intramuscular injection, reconstitute with sterile water for injection or bacteriostatic water for injection in the amounts shown in Table 1.<sup>1(9/08)</sup>

**Table 1. Reconstitution of cefotaxime sodium**<sup>1(9/08)</sup>

Vial Size	Volume of Diluent	Withdrawable Volume	Approximate Concentration
Intravenous			
500 mg	10 mL	10.2 mL	50 mg/mL
1 g	10 mL	10.4 mL	95 mg/mL
2 g	10 mL	11 mL	180 mg/mL
Intramuscular			
500 mg	2 mL	2.2 mL	230 mg/mL
1 g	3 mL	3.4 mL	300 mg/mL
2 g	5 mL	6 mL	330 mg/mL

The pharmacy bulk packages may be reconstituted according to the manufacturer's directions, and the dose should be diluted appropriately for administration.<sup>1(9/08) 4</sup>

After addition of the diluent, shake to dissolve the contents and inspect for particulate matter or discoloration.<sup>1(9/08)</sup>

For intravenous infusion, the primary solution may be diluted further to 50 to 1000 mL in a compatible diluent.<sup>1(9/08)</sup>

Cefotaxime sodium also is available as a frozen premixed iso-osmotic infusion solution of 1 or 2 g in dextrose 3.4 or 1.4%, respectively, buffered with sodium citrate. Hydrochloric acid and sodium hydroxide, if needed, are used to adjust the pH during manufacturing.<sup>1(9/08) 4</sup>

## pH

Injectable solutions of the drug have pH values ranging from 5 to 7.5.<sup>1(9/08)</sup>

## Tonicity

A solution of cefotaxime sodium 1 g/14 mL of sterile water for injection is isotonic.<sup>1(9/08)</sup>

## Osmolality

The osmolality of cefotaxime sodium 1, 2, and 3 g was calculated for the following dilutions.<sup>1054</sup>

Diluent	Osmolality (mOsm/kg)	
	50 mL	100 mL
1 g		
Dextrose 5%	350	319
Sodium chloride 0.9%	375	344
2 g		
Dextrose 5%	343	327
Sodium chloride 0.9%	406	351
3 g		
Dextrose 5%	433	344
Sodium chloride 0.9%	458	382

The frozen premixed solutions have osmolalities of 340 to 420 mOsm/kg for the 1-g/50 mL concentration and 450 to 540 mOsm/kg for the 2-g/50 mL concentration.<sup>4</sup>

The osmolality of cefotaxime sodium (Hoechst) 50 mg/mL was determined to be 326 mOsm/kg in dextrose 5% and 333 mOsm/kg in sodium chloride 0.9%.<sup>1375</sup>

The following maximum cefotaxime sodium concentrations were recommended to achieve osmolalities suitable for peripheral infusion in fluid-restricted patients:<sup>1180</sup>

Diluent	Maximum Concentration (mg/mL)	Osmolality (mOsm/kg)
Dextrose 5%	86	577
Sodium chloride 0.9%	73	555
Sterile water for injection	147	525

## Sodium Content

Cefotaxime sodium contains approximately 2.2 mEq (50.5 mg) of sodium per gram of cefotaxime activity.<sup>1(9/08)</sup>

## Trade Name(s)

Claforan

## Administration

Cefotaxime sodium may be administered by deep intramuscular injection; doses of 2 g should be divided between different injection sites. Cefotaxime also may be administered by direct intravenous injection over 3 to 5 minutes directly into the vein or into the tubing of a running compatible infusion solution. In addition, cefo-

taxime sodium may be administered in 50 to 100 mL of compatible diluent over 20 to 30 minutes by intermittent intravenous infusion or by continuous intravenous infusion.<sup>1(9/08) 4</sup>

The manufacturer states that cefotaxime sodium should not be admixed with aminoglycosides; however, they may be administered separately to the same patient.<sup>1(9/08) 792</sup>

## Stability

Intact vials of cefotaxime sodium should be stored below 30°C. The dry powder is off-white to pale yellow in color. Solutions may range from light yellow to amber, depending on the diluent, concentration, and storage conditions. Both the dry material and solutions may darken and should be protected from elevated temperatures and excessive light. Discoloration of the powder or solution may indicate a loss of potency.<sup>1(9/08) 4</sup>

Store the frozen premixed cefotaxime sodium infusions at -20°C or below. Thaw at room temperature or under refrigeration. Accelerated thawing using water bath immersion or microwave irradiation should not be used. Thawed solutions should not be refrozen.<sup>1(9/08) 4</sup>

When reconstituted as described in the Products section, cefotaxime sodium is stable in the original containers as indicated in Table 2. Storage of reconstituted solutions in disposable glass or plastic syringes for 5 days under refrigeration is also recommended.<sup>1(9/08)</sup>

**Table 2. Manufacturer's recommended storage times of reconstituted cefotaxime sodium<sup>1(9/08)</sup>**

Vial Size	Concentration	Storage Temperature	
		22°C	5°C
500 mg	230 mg/mL	12 hr	7 days
	50 mg/mL	24 hr	7 days
1 g	300 mg/mL	12 hr	7 days
	95 mg/mL	24 hr	7 days
(Infusion bottle)	10 to 20 mg/mL	24 hr	10 days
2 g	330 mg/mL	12 hr	7 days
	180 mg/mL	12 hr	7 days
(Infusion bottle)	20 to 40 mg/mL	24 hr	10 days

Cefotaxime sodium (Hoechst-Roussel) 1 g/10 mL reconstituted with sterile water for injection or 1 g/50 mL in dextrose 5% in PVC bags exhibited no visible changes in 24 hours at 5 and 25°C. Although increased levels of particulate matter were observed in most solutions, the increases were significant only in solutions stored at 25°C.<sup>986</sup>

The stability of cefotaxime sodium (Hoechst-Roussel) 125 mg/L in peritoneal dialysis solutions (Dianeal 137 and PD2) with

heparin sodium 500 units/L was evaluated at 25°C by microbiological assay. Approximately 95 ± 6% activity remained after 24 hours.<sup>1228</sup>

The stability of cefotaxime sodium (Hoechst-Roussel) 1 mg/mL in Dianeal PD-1 with dextrose 1.5 and 4.25% (Travenol) was reported. At 25°C, the drug exhibited an 8% loss in 24 hours and a 16% loss in 48 hours in both solutions. Storage at 37°C for 12 hours resulted in 11 and 14% losses in the solutions containing dextrose 1.5% and dextrose 4.25%, respectively.<sup>1481</sup>

## pH Effects

The primary factor in the stability of cefotaxime sodium is solution pH.<sup>792</sup> Cefotaxime sodium in aqueous solutions is stable at pH 5 to 7<sup>1(9/08)</sup> or 4.3 to 6.2.<sup>1077</sup> The theoretical pH of minimum decomposition is 5.13.<sup>793</sup> However, between pH 3 and 7, the hydrolysis rate is virtually independent of pH.<sup>1072</sup> Determination of decomposition kinetics in various aqueous buffer systems at 25°C showed 10% decomposition occurring in 24 hours or longer over a pH range of 3.9 to 7.6. At pH 2.2 and 8.4, 10% decomposition occurred in about 13 hours.<sup>793</sup>

The manufacturer recommends that cefotaxime sodium not be diluted in solutions with a pH greater than 7.5.<sup>1(9/08) 4</sup>

## Freezing Solutions

When reconstituted as recommended, cefotaxime sodium may be stored frozen in the vial or in disposable glass or plastic syringes for 13 weeks. Similarly, dilutions of cefotaxime sodium in dextrose 5% or sodium chloride 0.9% in PVC bags may be stored frozen for 13 weeks. Thawing at room temperature is recommended; frozen solutions should not be heated. Once thawed, the solutions are stable for 24 hours at room temperature or 5 days at less than 5°C. Thawed solutions should not be refrozen.<sup>1(9/08) 4</sup>

## Syringes

Cefotaxime sodium (Aventis) 50 mg/mL in sodium chloride 0.9% packaged in 5-mL polypropylene plastic syringes is visually compatible and undergoes about 10% loss in 2 days at 25°C and about 3% loss in 18 days at 5°C.<sup>2371</sup>

## Sorption

Cefotaxime sodium (Aventis) 50 mg/mL in sodium chloride 0.9% packaged in polypropylene plastic syringes exhibited no evidence of sorption when compared to glass containers.<sup>2371</sup>

## Central Venous Catheter

Cefotaxime sodium (Hoechst-Roussel) 5 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Delivery of the cefotaxime sodium ranged from 93 to 95% of the initial concentration among the 3 lumens. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

## Compatibility Information

### Solution Compatibility

#### Cefotaxime sodium

Test Soln Name	Mfr	Mfr	Conc/L or %	Remarks	Ref	C/I
Dextrose 5% in sodium chloride 0.225%		SAA		Stable for 24 hr at room temperature and 5 days refrigerated	1(9/08)	C

# Cefotetan Disodium

AHFS 8:12.07.12

## Products

Cefotetan disodium is available in 1- and 2-g vials and infusion bottles and 10-g pharmacy bulk packages.<sup>1(8/07)</sup>

For intramuscular injection, reconstitute the vials with sterile water for injection, bacteriostatic water for injection, sodium chloride 0.9%, or lidocaine hydrochloride 0.5 or 1%. Then shake well to dissolve and let stand until clear. Recommended volumes for reconstitution are shown in Table 1.<sup>1(8/07)</sup>

For intravenous use, reconstitute the vials with sterile water for injection in the amounts noted in Table 1, shake well to dissolve, and let stand until clear.<sup>1(8/07)</sup>

Reconstitute the 10-g pharmacy bulk package with sterile water for injection, dextrose 5%, or sodium chloride 0.9% according to the instructions on the package label. Then shake it well to dissolve and let stand until clear.<sup>1(8/07)</sup>

**Table 1. Recommended dilutions of cefotetan disodium**

vials<sup>1(8/07)</sup> 4

Vial Size	Volume of Diluent	Withdrawable Volume	Approximate Concentration
Intramuscular			
1 g	2 mL	2.5 mL	400 mg/mL
2 g	3 mL	4.0 mL	500 mg/mL
Intravenous			
1 g	10 mL	10.5 mL	95 mg/mL
2 g	10 to 20 mL	11 to 21 mL	182 to 95 mg/mL

Cefotetan disodium (Braun) is available as 1 and 2 g in a dual chamber flexible container. The diluent chamber contains dextrose solution 3.58% for the 1-g container and 2.08% for the 2-g container for use as a diluent.<sup>1(8/07)</sup>

## pH

Reconstituted solutions have a pH of 4.5 to 6.5.<sup>1(8/07)</sup>

## Osmolarity

Concentrations of 100 to 200 mg/mL in sterile water for injection have osmolarities of 400 to 800 mOsm/L, respectively. Intramuscular concentrations of 375 to 471.5 mg/mL are extremely hypertonic, with osmolarities greater than 1500 mOsm/L.<sup>4</sup>

## Osmolality

Cefotetan disodium (Braun) 1 and 2 g in dual chamber flexible containers has an osmolality of 290 mOsm/kg when activated with the dextrose solution diluent.<sup>1(8/07)</sup>

## Sodium Content

Each gram of cefotetan disodium contains approximately 3.5 mEq (80 mg) of sodium.<sup>1(8/07)</sup>

## Administration

Cefotetan disodium may be administered by deep intramuscular injection, direct intravenous injection over 3 to 5 minutes, and intermittent intravenous infusion in 50 to 100 mL of dextrose 5% or sodium chloride 0.9% infused over 20 to 60 minutes. The manufacturer recommends temporarily discontinuing other solutions being administered at the same site.<sup>1(8/07)</sup> 4

## Stability

Intact vials should be stored at 22°C or less and protected from light. Cefotetan disodium powder is white to pale yellow. Solutions may vary from colorless to yellow, depending on the concentration.<sup>1(8/07)</sup>

When reconstituted as recommended, cefotetan disodium solutions are stable for 24 hours at room temperature (25°C) and 96 hours under refrigeration (5°C). In disposable glass or plastic syringes, the drug also is stable for 24 hours at room temperature and 96 hours under refrigeration.<sup>1(8/07)</sup> 4

Cefotetan disodium (Braun) 1 and 2 g in dual chamber flexible plastic containers with dextrose solution diluent should be used within 12 hours after activation if stored at room temperature and in 5 days if stored under refrigeration.<sup>1(8/07)</sup>

## Freezing Solutions

The manufacturer states that solutions reconstituted as recommended are stable for at least 1 week when frozen at -20°C.<sup>1(8/07)</sup> The manufacturer also has stated that cefotetan disodium as the reconstituted solution in vials is stable for 1 year at -20°C; in a large volume parenteral solution, it is stable for 30 weeks at -20°C.<sup>283</sup> Thawing should be performed at room temperature, and thawed solutions should not be refrozen.<sup>1(8/07)</sup> 4

Cefotetan disodium (Braun) 1 and 2 g in dual chamber flexible containers should not be frozen.<sup>1(8/07)</sup>

## Central Venous Catheter

Cefotetan disodium (Zeneca) 5 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

## Cefoxitin Sodium

AHFS 8:12.07.12

### Products

Cefoxitin sodium is available in vials containing the equivalent of 1 and 2 g of cefoxitin (as sodium). It is also available in 10-g bulk bottles.<sup>1(4/08)</sup>

For intravenous administration, reconstitute the vial contents with sterile water for injection. The 1-g vials may be reconstituted with 10 mL resulting in a 95-mg/mL concentration. The 2-g vials may be reconstituted with 20 or 10 mL resulting in 95 or 180 mg/mL, respectively. The 10-g bulk bottles may be reconstituted with 93 or 43 mL resulting in 100 or 200 mg/mL, respectively. After addition of the diluent, shake the vial and allow the solution to stand until it becomes clear.<sup>1(4/08) 4</sup>

For intravenous infusion, the primary solution may be diluted further in 50 to 1000 mL of compatible diluent.<sup>1(4/08)</sup>

Cefoxitin sodium (Braun) is available as 1 and 2 g in a dual-chamber flexible container. The diluent chamber contains dextrose solution.<sup>1(4/08)</sup>

### pH

Reconstituted solutions have a pH of 4.2 to 7. The frozen premixed infusion and reconstituted drug in dual-chamber containers have a pH of about 6.5.<sup>1(4/08) 4</sup>

### Osmolality

The osmolality of cefoxitin sodium 1 and 2 g was calculated for the following dilutions:<sup>1054</sup>

Diluent	Osmolality (mOsm/kg)	
	50 mL	100 mL
<b>1 g</b>		
Dextrose 5%	326	293
Sodium chloride 0.9%	352	319
<b>2 g</b>		
Dextrose 5%	388	329
Sodium chloride 0.9%	415	355

The osmolality of cefoxitin sodium (MSD) 50 mg/mL was determined to be 348 mOsm/kg in dextrose 5% and 361 mOsm/kg in sodium chloride 0.9%.<sup>1375</sup>

Cefoxitin sodium (Braun) 1 and 2 g in dual-chamber flexible containers has an osmolality of 290 mOsm/kg when activated with the dextrose solution diluent.<sup>1(4/08)</sup>

The following maximum cefoxitin sodium concentrations were recommended to achieve osmolalities suitable for peripheral infusion in fluid-restricted patients.<sup>1180</sup>

Diluent	Maximum Concentration (mg/mL)	Osmolality (mOsm/kg)
Dextrose 5%	62	531
Sodium chloride 0.9%	56	508
Sterile water for injection	112	437

### Sodium Content

Each gram of cefoxitin sodium contains 2.3 mEq (53.8 mg) of sodium.<sup>1(4/08)</sup>

### Administration

Cefoxitin sodium may be administered by direct intravenous injection over 3 to 5 minutes directly into the vein or slowly into the tubing of a running compatible infusion solution, or by continuous or intermittent intravenous infusion. The manufacturer recommends temporarily discontinuing other solutions being administered at the site.<sup>1(4/08) 4</sup>

The manufacturer recommends that cefoxitin sodium not be mixed with aminoglycoside antibiotics such as amikacin sulfate, gentamicin sulfate, and tobramycin sulfate.<sup>1(4/08)</sup> However, compatibility studies show that such admixtures may indeed be sufficiently stable to allow combined mixture in the same solution.

### Stability

Intact vials of cefoxitin sodium should be stored between 2 and 25°C. Exposure to temperatures above 50°C should be avoided. The powder is white to off-white in color. Solutions may range from colorless to light amber.<sup>1(4/08)</sup> Both the dry material and solutions may darken, depending on storage conditions. Although moisture plays a role in the rate and intensity of the darkening, exposure to oxygen is the most significant factor. However, this discoloration is stated not to affect potency or relate to any significant chemical change. The concern over color is purely aesthetic.<sup>865</sup>

Exposure of cefoxitin sodium (MSD) 40 mg/mL in sterile water for injection to 37°C for 24 hours, to simulate the use of a portable infusion pump, resulted in about a 3 to 4% cefoxitin loss.<sup>1391</sup>

Cefoxitin sodium solutions reconstituted as indicated in Table 1 are stable for 48 hours at 25°C and at least 7 days and, in some cases, up to 1 month at 5°C.<sup>308</sup>

**Table 1. Stability of reconstituted cefoxitin sodium 1 g<sup>308</sup>**

Diluent	Volume	Remarks
Bacteriostatic water for injection (benzyl alcohol)	2 mL	9% decomposition in 48 hr at 25°C. 4% in 7 days and 10% in 1 month at 5°C
Bacteriostatic water for injection (parabens)	2 mL	9% decomposition in 48 hr at 25°C. 5% in 7 days and 12% in 1 month at 5°C
Dextrose 5%	10 mL	9% decomposition in 48 hr at 25°C, 2% in 7 days at 5°C
Lidocaine HCl 0.5% (with parabens)	2 mL	8% decomposition in 48 hr at 25°C. 5% in 7 days and 10% in 1 month at 5°C
Lidocaine HCl 1% (with parabens)	2 mL	7% decomposition in 48 hr at 25°C. 2% in 7 days and 10% in 1 month at 5°C
Sodium chloride 0.9%	10 mL	8% decomposition in 48 hr at 25°C
Water for injection	10 mL	10% decomposition in 48 hr at 25°C, 1% in 7 days at 5°C
Water for injection	4 mL	7% decomposition in 48 hr at 25°C, 2% in 7 days at 5°C
Water for injection	2 mL	8% decomposition in 48 hr at 25°C. 2% in 7 days and 10% in 1 month at 5°C
(In plastic syringe)	10 mL	6% decomposition in 24 hr and 11% in 48 hr at 25°C

Cefoxitin sodium (MSD) 1 and 2 g/10 mL in sterile water for injection, packaged in plastic syringes (Monoject), exhibited a 10% cefoxitin sodium loss in 2 days at 24°C and 23 days at 4°C. Less than 10% loss occurred in 3 months frozen at -15°C.<sup>1178</sup>

### pH Effects

Cefoxitin sodium at 1 and 10 mg/mL in aqueous solution is stable over pH 4 to 8. The time to 10% decomposition when stored at 25°C was essentially independent of pH, ranging from 40 to 44 hours at pH 4 to 5 to 33 hours at pH 8. Under refrigeration, a pH 7 (unbuffered) aqueous solution showed 10% decomposition in 26 days. At pH less than 4, precipitation of the free acid may occur. Above pH 8, hydrolysis of the  $\beta$ -lactam group may result.<sup>308</sup>

In another study, cefoxitin sodium in aqueous solution at 25°C exhibited minimum rates of decomposition at pH 5 to 7. The solutions in this pH range showed 10% decomposition in about 2 days. At pH 3, about 40 hours elapsed before 10% decomposition occurred. However, at pH 9, only 14 hours was required to incur a 10% loss.<sup>630</sup>

### Freezing Solutions

The stability of cefoxitin sodium reconstituted with the diluents as shown in Table 2 was evaluated in the frozen state at -20°C. The solutions retained adequate potency for at least 30 weeks.<sup>308</sup> Thawed solutions should not be refrozen.<sup>1(4/08)</sup> Frozen

premixed cefoxitin solutions also should not be refrozen after thawing. The manufacturer states that the thawed solution may be stored for 24 hours at room temperature or 21 days under refrigeration.<sup>1(4/08)</sup>

An approximate twofold increase in particles of 2 to 60  $\mu$ m produced by freezing and thawing cefoxitin sodium (MSD) 2 g/100 mL of dextrose 5% (Travenol) was reported. The reconstituted drug was filtered through a 0.45- $\mu$ m filter into polyvinyl chloride (PVC) bags of solution and frozen for 7 days at -20°C. Thawing was performed at room temperature (29°C) for 12 hours. Although the total number of particles increased significantly, no particles greater than 60  $\mu$ m were observed; the solutions complied with USP standards for particle sizes and numbers in large volume parenteral solutions.<sup>822</sup>

**Table 2. Stability of reconstituted cefoxitin sodium 1 g frozen at -20°C<sup>308</sup>**

Diluent	Volume	Remarks
Bacteriostatic water for injection (benzyl alcohol)	10 mL	2% decomposition in 30 weeks. Thawed solutions showed 6% decomposition in 24 hr at 25°C and 1% in 7 days at 5°C
Bacteriostatic water for injection (parabens)	10 mL	2% decomposition in 30 weeks. Thawed solutions showed no decomposition in 24 hr at 25°C and 1% in 7 days at 5°C
Dextrose 5%	10 mL	3% decomposition in 30 weeks. Thawed solutions showed 8% decomposition in 24 hr at 25°C and 6% in 7 days at 5°C
Lidocaine HCl 0.5%	2 mL	2% cefoxitin decomposition in 26 weeks. Thawed solutions showed 6% decomposition in 24 hr at 25°C. Lidocaine stable
Sodium chloride 0.9%	10 mL	5% decomposition in 30 weeks. Thawed solutions showed 3% decomposition in 24 hr at 25°C and 6% in 7 days at 5°C
Water for injection	10 mL	1% decomposition in 30 weeks. Thawed solutions showed 3% decomposition in 24 hr at 25°C and 5% in 7 days at 5°C
Water for injection	4 mL	No decomposition in 13 weeks

A 3% or less cefoxitin sodium (MSD) loss was reported from a solution containing 40 mg/mL in sterile water for injection in PVC and glass containers after 30 days at -20°C. Subsequent thawing and storage for 4 days at 5°C, followed by 24 hours at 37°C to simulate the use of a portable infusion pump, resulted in an additional 3 to 4% cefoxitin sodium loss.<sup>1391</sup>

Cefoxitin sodium in sodium chloride 0.9%, Ringer's injection, lactated, and dextrose 5% in PVC bags is stable for 26 weeks if kept frozen.<sup>4</sup>

Cefoxitin sodium (Braun) 1 and 2 g in dual-chamber flexible containers should not be frozen.<sup>1(4/08)</sup>

### Sorption

Cefoxitin sodium was shown not to exhibit sorption to PVC bags and tubing, polyethylene tubing, Silastic tubing, and polypropylene syringes.<sup>536 606</sup>

### Central Venous Catheter

Cefoxitin sodium (Merck) 5 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter.

Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

## Ceftaroline Fosamil

AHFS 8:12.06.20

### Products

Ceftaroline fosamil is available in vials containing 400 and 600 mg of anhydrous ceftaroline fosamil with L-arginine.<sup>2832</sup>

The 400- and 600-mg vials of ceftaroline fosamil should be reconstituted with 20 mL of sterile water for injection, sodium chloride 0.9%, dextrose 5%, or Ringer's injection, lactated and mixed gently, yielding concentrations of 20 and 30 mg/mL, respectively.<sup>2832</sup> The reconstituted solution must be further diluted in a suitable infusion solution prior to administration.<sup>2832</sup> The same diluent should be used for both reconstitution and further dilution unless the drug was reconstituted with sterile water, in which case any compatible infusion solution should be used for further dilution.<sup>2832</sup> (See Solution Compatibility.)

For adults and pediatric patients *at least 2 years of age weighing more than 33 kg* and requiring doses of 400 or 600 mg, the entire reconstituted contents of a 400- or 600-mg vial, respectively, must be diluted in 50 to 250 mL of a compatible infusion solution.<sup>2832</sup> For adults requiring doses less than 400 mg (e.g., those with renal impairment requiring dosage adjustment), the appropriate volume of the reconstituted solution must be withdrawn from the vial and diluted in 50 to 250 mL of a compatible infusion solution.<sup>2832</sup> For pediatric patients *weighing 33 kg or less*, the appropriate volume of the reconstituted solution must be withdrawn from the vial and diluted in a compatible infusion solution to yield an infusion solution with a ceftaroline fosamil concentration not exceeding 12 mg/mL.<sup>2832</sup>

The manufacturer recommends the following instructions specifically for the dilution of ceftaroline fosamil in 50-mL infusion bags: When ceftaroline fosamil is prepared for administration in a 50-mL infusion bag for adults, 20 mL of the diluent

should be removed from the infusion bag prior to injecting the entire reconstituted contents of a 600-mg vial of the drug to yield an approximate concentration of 12 mg/mL.<sup>2832</sup> When the drug is prepared for administration in a 50-mL infusion bag for adults or pediatric patients *weighing more than 33 kg*, 20 mL of the diluent should be removed from the infusion bag prior to injecting the entire reconstituted contents of a 400-mg vial of the drug to yield an approximate concentration of 8 mg/mL.<sup>2832</sup> When the drug is prepared for administration in a 50-mL infusion bag for pediatric patients *weighing 33 kg or less*, the appropriate volume of the reconstituted solution should be withdrawn from the vial and transferred to an infusion bag to yield a concentration not exceeding 12 mg/mL.<sup>2832</sup>

### pH

The reconstituted solution has a pH ranging from 4.8 to 6.5.<sup>2832</sup>

### Trade Name(s)

Teflaro

### Administration

Following dilution in a compatible infusion solution, ceftaroline fosamil is administered by intravenous infusion over 5 to 60 minutes in patients 2 months of age or older and over 30 to 60 minutes in patients less than 2 months of age.<sup>2832</sup>

### Stability

Intact vials should be stored at controlled room temperature.<sup>2832</sup> The powder is pale yellowish-white to light yellow in color.<sup>2832</sup> After reconstitution, ceftaroline fosamil solution is clear and light to dark yellow in color.<sup>2832</sup>

<sup>a</sup> Tested in dextrose 5%.

<sup>b</sup> Tested in sodium chloride 0.9%.

<sup>c</sup> Tested in Ringer's injection, lactated.

<sup>d</sup> Test performed using the formulation WITH edetate disodium.

<sup>e</sup> Refer to Appendix for the composition of parenteral nutrition solutions. TPN indicates a 2-in-1 admixture.

<sup>f</sup> Trimethoprim component. Trimethoprim in a 1:5 fixed-ratio concentration with sulfamethoxazole.

<sup>g</sup> Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>h</sup> Ceftolozane component. Ceftolozane in a 2:1 fixed-ratio concentration with tazobactam.

<sup>i</sup> Meropenem component. Meropenem in 1:1 fixed-ratio concentration with vaborbactam.

<sup>j</sup> Ceftazidime component. Ceftazidime in a 4:1 fixed-ratio concentration with avibactam.

<sup>k</sup> Tested in dextrose 5%, sodium chloride 0.9%, and Ringer's injection, lactated.

<sup>l</sup> Test performed using the formulation WITHOUT edetate disodium.

# Ceftazidime

AHFS 8:12.06.12

## Products

Ceftazidime is supplied in vials containing 500 mg, 1 g, and 2 g of drug (under reduced pressure), infusion packs containing 1 and 2 g of drug, and 6-g pharmacy bulk packages. The dosage forms contain sodium carbonate 118 mg per gram of ceftazidime. The sodium salt of ceftazidime and carbon dioxide are formed during reconstitution.<sup>1(2/07)</sup> 4 The use of a venting needle has been suggested for ease of use.<sup>1136</sup> Spraying or leaking of the solution after needle withdrawal has been reported, especially with smaller vials.<sup>1137</sup> The use of larger vials reduces the occurrence of such leakage.<sup>1137 1138</sup> Care must be taken if a multiple-additive set with a 2-way valve is used for reconstitution. The negative pressure in the product may cause inaccuracies in the volume of diluent added to the vial. In one test, almost 3 mL extra entered the vial during reconstitution.<sup>1240</sup> Vials have been vented prior to reconstitution but clamping the tubing from the supply bottle prior to adding the diluent to the vial when multiple-additive sets are used is recommended.<sup>1241</sup>

Ceftazidime is also supplied in frozen solutions containing 1 and 2 g/50 mL of dextrose 4.4 and 3.2%, respectively.<sup>1(2/07)</sup> 4

For intramuscular injection, ceftazidime should be reconstituted with sterile water for injection, bacteriostatic water for injection, or lidocaine hydrochloride 0.5 or 1% using 1.5 mL for the 500-mg vial and 3 mL for the 1-g vial. Any carbon dioxide bubbles that are withdrawn into the syringe should be expelled prior to injection.<sup>1(2/07)</sup> 4

For direct intravenous injection, ceftazidime should be reconstituted with sterile water for injection. Carbon dioxide will form during dissolution, but the solution will clear in about 1 to 2 minutes.<sup>1(2/07)</sup> 4

**Table 1. Reconstitution for intravenous injection**<sup>1(2/07)</sup>

Product	Volume of Diluent	Withdrawable Volume	Concentration
500 mg	5.3 mL	5.7 mL	100 mg/mL
1 g	10 mL	10.6 mL	100 mg/mL
2 g	10 mL	11.5 mL	170 mg/mL

For intravenous infusion, the reconstituted solution can be added to a compatible infusion solution (after expelling any carbon dioxide bubbles that have entered the syringe). Alternatively, the 1- or 2-g infusion packs can be reconstituted with 100 mL of compatible infusion solution, yielding a 10- or 20-mg/mL solution, respectively.<sup>1(2/07)</sup> 4 To reconstitute the infusion packs, add the diluent in 2 increments. Initially, add 10 mL with shaking to dissolve the drug. To release the carbon dioxide pressure, insert a venting needle through the closure only after the drug has dissolved and become clear (about 1 to 2 minutes). Then add the remaining 90 mL and remove the venting needle. Additional pressure may develop, especially during storage, and should be released prior to use.<sup>4</sup>

The 6-g pharmacy bulk package should be reconstituted with 26 mL of a compatible diluent to yield 30 mL of solution containing 200 mg/mL of ceftazidime. The carbon dioxide pressure that develops should be released using a venting needle. The 200-mg/mL concentrated solution must be diluted further for intravenous use.<sup>1(2/07)</sup>

## pH

From 5 to 8.<sup>1(2/07)</sup> 4

## Osmolality

The osmolality of ceftazidime (Fortaz, Glaxo) 50 mg/mL was determined to be 321 mOsm/kg in dextrose 5% and 330 mOsm/kg in sodium chloride 0.9%.<sup>1375</sup>

The following maximum ceftazidime concentrations were recommended to achieve osmolalities suitable for peripheral infusion in fluid-restricted patients:<sup>1180</sup>

Diluent	Maximum Concentration (mg/mL)	Osmolality (mOsm/kg)
Dextrose 5%	70	503
Sodium chloride 0.9%	63	486
Sterile water for injection	126	302

## Sodium Content

Each gram of ceftazidime activity provides 2.3 mEq (54 mg) of sodium from the sodium carbonate present in the formulation.<sup>1(2/07)</sup> 4

## Trade Name(s)

Fortaz, Tazicef

## Administration

Ceftazidime may be administered by deep intramuscular injection, by direct intravenous injection over 3 to 5 minutes directly into a vein or through the tubing of a running compatible infusion solution, or by intermittent intravenous infusion over 15 to 30 minutes. The manufacturer recommends temporarily discontinuing other solutions being administered at the same site during ceftazidime infusion. The drug may be instilled intraperitoneally in a concentration of 250 mg/2 L of compatible dialysis solution.<sup>1(2/07)</sup> 4

## Stability

Intact vials should be stored at controlled room temperature and protected from light.<sup>1(2/07)</sup> Approximately 2% decomposition has been reported after 12 months of storage at 37°C with protection from light.<sup>1136</sup>

Reconstituted ceftazidime solutions are light yellow to amber, depending on the diluent and concentration, and may darken on storage. Color changes do not necessarily indicate a potency loss.<sup>1(2/07)</sup> 4

Solutions in sterile water for injection at 95 to 280 mg/mL, in lidocaine hydrochloride 0.5 or 1% or bacteriostatic water for injection at 280 mg/mL, and in sodium chloride 0.9% or dextrose 5% at 10 or 20 mg/mL in piggyback infusion packs are stable for 24 hours at room temperature and 7 days under refrigeration. Tazicef and Tazidime in sterile water for injection at 95 to 280 mg/mL or in sodium chloride 0.9% at 10 to 20 mg/mL are stable for 24 hours at room temperature and 7 days under refrigeration.<sup>1(2/07)</sup>

One report of ceftazidime in concentrations of 1, 40, and 333 mg/mL in water indicated no loss after 24 hours at 4°C and 6 hours at 25°C. About a 4 to 6% loss was reported after 24 hours at 25°C.<sup>1136</sup>

Ceftazidime vials reconstituted with sterile water for injection to a concentration of 270 mg/mL were evaluated for stability at 4 temperatures. About 8 to 9% ceftazidime loss occurred in 7 days under refrigeration at 4°C and in 4 days at 10°C. At 20°C about 7 to 8% loss occurred in 24 hours, but at a higher room temperature of 30°C about 5% loss occurred in 6 hours and 12% loss occurred in 18 hours.<sup>2285</sup>

### Freezing Solutions

Ceftazidime products differ in their reported stabilities, both during frozen storage of their solutions and after thawing. Table 2 summarizes the reported stabilities.<sup>4</sup>

**Table 2. Reported stabilities of frozen and thawed solutions of ceftazidime products<sup>1(2/07)</sup> 4**

Concentration	Fortaz	Tazicef
<b>280 mg/mL</b>		
Frozen	3 months <sup>a</sup>	3 months <sup>a</sup>
Thawed/RT <sup>b</sup>	8 hr	8 hr
Thawed/4°C <sup>c</sup>	4 days	4 days
<b>100 to 180 mg/mL</b>		
Frozen	6 months <sup>a</sup> <sup>d</sup>	3 months <sup>e</sup>
Thawed/RT	24 hr	8 hr
Thawed/4°C	7 days	4 days
<b>10 to 20 mg/mL<sup>f</sup></b>		
Frozen	9 months <sup>a</sup>	
Thawed/RT	24 hr	
Thawed/4°C	7 days	

<sup>a</sup> In sterile water for injection.

<sup>b</sup> Thawed and stored at room temperature.

<sup>c</sup> Thawed and stored at 4 to 5°C.

<sup>d</sup> In sodium chloride 0.9%.

<sup>e</sup> In sodium chloride 0.9% and dextrose 5%.

<sup>f</sup> In infusion packs.

The commercially available frozen ceftazidime solutions (Fortaz, Glaxo) of 1 and 2 g/50 mL of sodium chloride 0.9%, when thawed, are stable for 24 hours at room temperature or 7 days under refrigeration.<sup>4</sup>

Ceftazidime (Fortaz, Glaxo) 1 g/50 mL in sodium chloride 0.9% was stored frozen at -20°C. About 7% loss occurred in 97 days. After thawing at room temperature, subsequent storage refrigerated for 4 days and at room temperature for 24 hours resulted in additional loss with only about 90% of the ceftazidime remaining.<sup>500</sup>

Less than a 2% ceftazidime (Fortaz, Glaxo) loss was reported from a solution containing 36.6 mg/mL in sterile water for injection in polyvinyl chloride (PVC) and glass containers after 30 days at -20°C. Subsequent thawing and storage for 4 days at 5°C, followed by 24 hours at 37°C to simulate the use of a portable infusion pump, resulted in little additional ceftazidime loss.<sup>1391</sup>

Ceftazidime (Fortaz, Glaxo) 100 and 200 mg/mL in sterile water for injection in glass vials and polypropylene syringes (Becton Dickinson) was stored frozen at -20°C for 91 days followed by 8 hours at 22°C. Losses of about 5 and 10% occurred in the 100- and 200-mg/mL concentrations, respectively. Freezing at -20°C for 91 days followed by refrigeration at 4°C for 4 days resulted in losses of about 10 and 6% in the 100- and 200-mg/mL concentrations, respectively. Particle counts remained within USP limits throughout the study.<sup>1580</sup>

Usually, frozen solutions should be thawed at room temperature or under refrigeration. Other techniques are not recommended. Thawed solutions should not be refrozen.<sup>1(2/07)</sup> 4

### Light Effects

Ceftazidime reconstituted with sterile water for injection to a concentration of 270 mg/mL exhibited no substantial difference in stability when stored protected from light or exposed to daylight.<sup>2285</sup>

### Syringes

Ceftazidime (Fortaz, Glaxo) 100 and 200 mg/mL in sterile water for injection in polypropylene syringes (Becton Dickinson) and glass vials exhibited a 5% or less loss in 8 hours at 22°C and 96 hours at 4°C.<sup>1580</sup>

Ceftazidime (Hospira) 1 mg/mL in sodium chloride 0.9% in plastic syringes was stored at room temperature, refrigerated, and frozen at -20°C. About 10% ceftazidime loss occurred in 3 days at room temperature and in 17 days refrigerated. No loss occurred in the frozen samples over 60 days.<sup>2793</sup>

### Ambulatory Pumps

Ceftazidime (Fortaz, Glaxo) at a concentration of 60 mg/mL in water for injection was filled into PVC portable infusion pump reservoirs (Pharmacia Deltec). Storage at -20°C resulted in less than 3% loss in 14 days. The thawed reservoirs were then stored under refrigeration at 6°C. Losses totaled 10% after 5 days of refrigerated storage. Under simulated use conditions at 30°C, ceftazidime decomposes at a rate of about 10% in 18 hours. The authors concluded prefilling of reservoirs with ceftazidime solutions for home use was not advisable.<sup>2008</sup>

### Central Venous Catheter

Ceftazidime (Fortaz, Glaxo Wellcome) 10 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen

central catheter. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

Ceftazidime 10 mg/mL with heparin sodium 5000 units/mL as an antibiotic lock in polyurethane central hemodialysis

catheters lost about 50% of the antibiotic over 72 hours at 37°C. The loss was attributed to sorption to the catheters. Nevertheless, the reduced antibiotic concentration (about 5 mg/mL) remained effective against common microorganisms in catheter-related bacteremia in hemodialysis patients.<sup>2515 2516</sup>

Sodium chloride 0.9%		GL	20 g	7% loss in 24 hr at 25°C and no loss in 48 hr at 4°C	1136	C
Sodium chloride 0.9%	TR <sup>a</sup>		40 g	Physically compatible with 5% loss in 2 days and 12% loss in 3 days at 25°C; 7% loss in 28 days at 5°C and 6% loss in 90 days at -10°C	1341	C
Sodium chloride 0.9%	<sup>b</sup>	GL	40 g	Physically compatible with 3% loss in 1 day and 14% loss in 3 days at 25°C; 10% loss in 14 days at 5°C	1353	C
Sodium chloride 0.9%	BA <sup>b</sup>	GL	2 and 6 g	Visually compatible with 4 to 6% loss in 24 hr at room temperature	1937	C
Sodium chloride 0.9%	<sup>b</sup>		4 g	Visually compatible with little or no loss in 24 hr at room temperature and 4°C	1953	C
Sodium chloride 0.9%	KA <sup>h</sup>	GL	60 g	Visually compatible with little or no loss of ceftazidime and little formation of pyridine in 14 days frozen at -20°C	2113	C
Sodium chloride 0.9%	KA <sup>h</sup>	GL	60 g	Visually compatible with 9% loss of ceftazidime but formation of potentially toxic pyridine 0.53 mg/mL in 14 days at 4°C	2113	?
Sodium chloride 0.9%	BA <sup>b</sup> , BRN <sup>a,c</sup>	GW	10 g	Visually compatible with little or no loss in 24 hr at 4 and 22°C	2289	C
Sodium chloride 0.9%	BA <sup>d</sup>	GW	40 g	10% loss occurred in about 12 to 16 hr at 37°C in the dark	2421	I
Sodium chloride 0.9%	<sup>f</sup>	GW	40 g	Losses of 1, 3, and 6% in 20 hr at 20°C, and losses of 6, 11, and 13% in 20 hr at 35°C in glass, polypropylene, and PVC containers, respectively	2539	C
Sodium chloride 0.9%	<sup>i</sup>		40 g	Less than 10% loss in theoretical concentration in 8 hr at ambient temperature when administered as a continuous infusion	3535	C
Sodium lactate ½ M			1 to 40 g	Physically and chemically stable for 24 hr at room temperature and 7 days refrigerated	1(2/07)	C
TPN #107 <sup>g</sup>			1 g	Activity retained for 24 hr at 21°C	1326	C
TPN #141 to #143 <sup>g</sup>		GL	1 g	Visually compatible with 8% ceftazidime loss in 6 hr and 10% loss in 24 hr at 22°C. 8% ceftazidime loss in 3 days at 4°C	1535	C
TPN #141 to #143 <sup>g</sup>		GL	6 g	Visually compatible with 6% ceftazidime loss in 12 hr and 11 to 13% loss in 24 hr at 22°C. 7 to 9% ceftazidime loss in 3 days at 4°C	1535	C

<sup>a</sup> Tested in glass containers.

<sup>b</sup> Tested in PVC containers.

<sup>c</sup> Tested in polyethylene plastic containers.

<sup>d</sup> Tested in Infusor LV 10 (elastomeric), Easypump LT 125 (elastomeric), Ultra-Flow (PVC), and Outbound (polyethylene) infusion device reservoirs.

<sup>e</sup> Tested in Singleday Infusors (Baxter).

<sup>f</sup> Tested in glass, polypropylene, and PVC containers.

<sup>g</sup> Refer to Appendix for the composition of parenteral nutrition solutions. TPN indicates a 2-in-1 admixture.

<sup>h</sup> Tested in elastomeric ambulatory pumps (Homepump, Block Medical).

<sup>i</sup> Tested in polypropylene syringes.

## Additive Compatibility

### Ceftazidime

Test Drug	Mfr	Conc/L or %	Mfr	Conc/L or %	Test Solution	Remarks	Ref	C/I
Amikacin sulfate	BR	25 mg	GL	50 mg	D5W	28% loss of amikacin in 2 hr at 22°C	504	I
Amikacin sulfate	BR	15 mg	GL	50 mg	D5W	17% loss of amikacin in 24 hr at 22°C	504	I
Aminophylline	ES	1 g	GL	2 g	D5W, NS	20 to 23% ceftazidime loss in 6 hr at room temperature	1937	I
Aminophylline	ES	1 g	GL	6 g	D5W, NS	8 to 10% ceftazidime loss in 6 hr at room temperature	1937	I
Aminophylline	ES	2 g	GL	2 g	D5W, NS	35 to 40% ceftazidime loss in 6 hr at room temperature	1937	I
Aminophylline	ES	2 g	GL	6 g	D5W, NS	22% ceftazidime loss in 6 hr at room temperature	1937	I
Ciprofloxacin	MI	2 g		20 g	D5W	Physically incompatible	888	I
Ciprofloxacin	BAY	2 g	SKB	19.8 g	D5W	Visually compatible but pH changed by more than 1 unit	2413	?
Clindamycin phosphate	UP	9 g	GL	20 g	D5W <sup>b</sup>	Physically compatible with 9% clindamycin loss and 11% ceftazidime loss in 48 hr at 25°C under fluorescent light	1026	C
Clindamycin phosphate	UP	9 g	GL	20 g	NS <sup>b</sup>	Physically compatible with 5% clindamycin loss and 7% ceftazidime loss in 48 hr at 25°C under fluorescent light	1026	C
Floxacin sodium	GSK	40 g	GSK	40 g	NS, W	Physically compatible. Under 10% loss in 24 hr at room temperature and 4°C	2658	C
Floxacin sodium	GSK	120 g	GSK	60 g	NS, W	Physically compatible. Under 10% loss in 24 hr at room temperature and 4°C	2658	C
Floxacin sodium	GSK	240 g	GSK	180 g	NS, W	Physically compatible. Under 10% loss in 24 hr at room temperature and 4°C	2658	C
Fluconazole	PF	1 g	GL	20 g	D5W	Visually compatible with no fluconazole loss in 72 hr at 25°C under fluorescent light. Ceftazidime not tested	1677	C
Gentamicin sulfate	SC	6 and 9 mg	GL	50 mg	D5W	10 to 20% gentamicin loss in 2 hr at 22°C	504	I
Heparin sodium		10,000 and 50,000 units		4 g	D5W, NS	Ceftazidime stable for 24 hr at room temperature and 7 days refrigerated	4	C
Linezolid	PHU	2 g	GW	20 g	<sup>c</sup>	Physically compatible with no linezolid loss in 7 days at 4 and 23°C protected from light. Ceftazidime losses of 5% in 24 hr and 12% in 3 days at 23°C and about 3% in 7 days at 4°C	2262	C
Metronidazole		5 g	GL	20 g		No loss of either drug in 4 hr	1345	C
Metronidazole	AB	5 g	LI	10 g		Visually compatible with little or no loss of either drug in 72 hr at 8°C	1849	C
Potassium chloride		10 and 40 mEq		4 g	D5W, NS	Ceftazidime stable for 24 hr at room temperature and 7 days refrigerated	4	C
Ranitidine HCl	GL	500 mg	GL	10 g	D2.5/5	8% ranitidine loss in 4 hr and 37% loss in 24 hr at 22°C	1632	I
Sodium bicarbonate		4.2%	GL	20 g		11% ceftazidime loss in 24 hr at 25°C. 3% loss in 48 hr at 4°C	1136	C
Tenoxicam	RC	200 mg	LI	5 g	D5W <sup>a</sup>	Visually compatible for up to 72 hr with yellow discoloration. 10% loss of ceftazidime in 96 hr and of tenoxicam in 168 hr at 4 and 25°C	2557	C
Tenoxicam	RC	200 mg	LI	5 g	D5W <sup>b</sup>	Visually compatible with about 10% loss of both drugs in 168 hr at 4 and 25°C	2557	C

<sup>a</sup> Tested in PVC containers.

<sup>b</sup> Tested in glass containers.

<sup>c</sup> Admixed in the linezolid infusion container.

## Drugs in Syringe Compatibility

### Ceftazidime

Test Drug	Mfr	Amt	Mfr	Amt	Remarks	Ref	C/I
Dimenhydrinate		10 mg/1 mL		100 mg/1 mL	Clear solution	2569	C
Hydromorphone HCl	KN	2, 10, 40 mg/1 mL	GL	180 mg/1 mL	Visually compatible with less than 10% loss of either drug in 24 hr at room temperature	2082	C
Pantoprazole sodium	<sup>a</sup>	4 mg/1 mL		100 mg/1 mL	Precipitates immediately	2574	I

<sup>a</sup> Test performed using the formulation WITHOUT edetate disodium.

<sup>q</sup> Sodium carbonate-containing formulation tested.

<sup>r</sup> Test performed using the formulation WITH edetate disodium.

## Additional Compatibility Information

### Peritoneal Dialysis Solutions

Ceftazidime 2 mg/mL in Dianeal with dextrose 1.5% is stated to be stable for 10 days under refrigeration, 24 hours at room temperature, and at least 4 hours at 37°C.<sup>4</sup>

Ceftazidime (Glaxo) 125 mg/L and tobramycin sulfate (Lilly) 8 mg/L in Dianeal PD-2 with dextrose 2.5% (Baxter) were visually compatible and chemically stable. After 16 hours of storage at 25°C under fluorescent light, the loss of both drugs was less than 3%. Additional storage for 8 hours at 37°C, to simulate the maximum peritoneal dwell time, showed tobramycin sulfate concentrations of 96% and ceftazidime concentrations of 92 to 96%.<sup>1652</sup>

Ceftazidime (Glaxo) 0.1 mg/mL in Dianeal PD-2 with dextrose 1.5% in PVC containers was physically and chemically stable for 24 hours at 25°C exposed to light, exhibiting about 9% loss; additional storage for 8 hours at 37°C resulted in additional loss of about 6%. Under refrigeration at 4°C protected from light, no loss occurred in 7 days. Additional storage for 16 hours at 25°C followed by 8 hours at 37°C resulted in about 6% loss.<sup>1989</sup>

Ceftazidime (Glaxo) 0.1 mg/mL admixed with teicoplanin (Marion Merrell Dow) 0.025 mg/mL in Dianeal PD-2 with dextrose 1.5% in PVC containers did not result in a stable mixture. Large (but variable) teicoplanin losses generally in the 20% range were noted in as little as 2 hours at 25°C exposed to light. Ceftazidime losses of about 9% occurred in 16 hours. Refrigeration and protection from light of the peritoneal dialysis admixture reduced losses of both drugs to negligible levels. Even so, the authors did not recommend admixing these 2 drugs because of the high levels of teicoplanin loss at room temperature.<sup>1989</sup>

Ceftazidime (Glaxo) 0.1 mg/mL in Dianeal PD-2 with dextrose 1.5% with or without heparin sodium 1 unit/mL in PVC bags was chemically stable for up to 6 days at 4°C (about 3 to 4% loss),

4 days at 25°C (about 9 to 10% loss), and less than 12 hours at body temperature of 37°C.<sup>866</sup>

The addition of vancomycin hydrochloride (Lederle) 0.05 mg/mL to this peritoneal dialysis solution demonstrated similar stability with the ceftazidime being the defining component. Ceftazidime was chemically stable for up to 6 days at 4°C (about 3% loss), 3 days at 25°C (about 9 to 10% loss), and 12 hours at body temperature of 37°C with the vancomycin exhibiting less loss throughout.<sup>866</sup>

Vancomycin hydrochloride (Lilly) 1 mg/mL admixed with ceftazidime (Lilly) 0.5 mg/mL in Dianeal PD-2 (Baxter) with 1.5% and also 4.25% dextrose were evaluated for compatibility and stability. Samples were stored under fluorescent light at 4 and 24°C for 24 hours and at 37°C for 12 hours. No precipitation or other change was observed by visual inspection in any sample. No loss of either drug occurred in the samples stored at 4°C and no loss of vancomycin hydrochloride and about 4 to 5% ceftazidime loss occurred in the samples stored at 24°C in 24 hours. Vancomycin hydrochloride losses of 3% or less and ceftazidime loss of about 6% were found in the samples stored at 37°C for 12 hours. No difference in stability was found between samples at either dextrose concentration.<sup>2217</sup>

Ceftazidime (GlaxoWellcome) 0.125 mg/mL in Delflex peritoneal dialysis solution bags with 2.5% dextrose (Fresenius) was stable with 10% loss occurring in 7 days at refrigerator temperature and 3 days at room temperature.<sup>2573</sup>

Ceftazidime (Sandoz) 500 mg/L in Extraneal with icodextrin 7.5% (Baxter) peritoneal dialysis solution bags exhibited less than 10% loss in 14 days at 4°C and 2 days at 25°C; the drug was unstable at 37°C.<sup>3537</sup> Ceftazidime (Sandoz) 500 mg/L with cefazolin sodium (Hospira) 500 mg/L in Extraneal with icodextrin 7.5% (Baxter) peritoneal dialysis solution bags exhibited less than 10% loss of either drug in 14 days at 4°C, 6% loss of ceftazidime and 2% loss of cefazolin in 2 days at 25°C, and no loss of ceftazidime and 2% loss of cefazolin in 6 hours at 37°C.<sup>3537</sup>

## Ceftazidime–Avibactam Sodium

AHFS 8:12.06.12

### Products

The fixed combination of ceftazidime–avibactam sodium is available as a powder in single-use vials containing 2.5 g (ceftazidime 2 g as the pentahydrate plus avibactam 0.5 g as the sodium salt).<sup>3004</sup> Each vial also contains sodium carbonate 239.6 mg.<sup>3004</sup>

Each 2.5-g vial should be reconstituted with 10 mL of sterile water for injection, sodium chloride 0.9%, dextrose 5%, Ringer's injection, lactated, or solutions containing any combination of dextrose and sodium chloride with concentrations not exceeding 2.5 and 0.45%, respectively,<sup>3004 3005</sup> the vial contents should be mixed gently.<sup>3004</sup> Each mL of the resultant reconstituted solution contains approximately 167 mg of ceftazidime plus 42 mg of avibactam.<sup>3004</sup> The reconstituted solution is *not* suitable for direct injection and must be diluted prior to infusion.<sup>3004</sup>

For adult and pediatric patients *weighing 40 kg or more*, the manufacturer's instructions for preparing various dosages of ceftazidime–avibactam with final ceftazidime and avibactam concentrations of 8 to 40 and 2 to 10 mg/mL, respectively, from the reconstituted solution are as follows:<sup>3004</sup>

For 2.5 g (ceftazidime 2 g plus avibactam 0.5 g), withdraw the entire vial contents (i.e., 12 mL) and add to an infusion bag to achieve a total volume of 50 to 250 mL in a compatible diluent.

For 1.25 g (ceftazidime 1 g plus avibactam 0.25 g), withdraw 6 mL and add to an infusion bag to achieve a total volume of at least 50 mL (but less than 250 mL) in a compatible diluent.

For 940 mg (ceftazidime 750 mg plus avibactam 190 mg), withdraw 4.5 mL and add to an infusion bag to achieve a total volume of at least 50 mL (but less than 250 mL) in a compatible diluent.

For pediatric patients *weighing less than 40 kg*, the appropriate volume of the reconstituted solution to achieve the

prescribed dose should be withdrawn from the vial and diluted in a compatible diluent to final ceftazidime and avibactam concentrations of 8 to 40 and 2 to 10 mg/mL, respectively.<sup>3004</sup>

The same diluent should be used for both reconstitution and further dilution unless the drug was reconstituted with sterile water, in which case any compatible diluent should be used for further dilution.<sup>3004</sup> The diluted solution for infusion should be mixed gently to ensure complete dissolution and visually inspected for particulate matter and discoloration.<sup>3004</sup>

### Sodium Content

Each 2.5-g vial contains approximately 6.4 mEq (146 mg) of sodium.<sup>3004</sup>

### Trade Name(s)

Avycaz

### Administration

Ceftazidime–avibactam sodium is administered by intravenous infusion over 2 hours following dilution of the reconstituted solution in a suitable infusion solution.<sup>3004</sup>

### Stability

Intact vials should be stored at controlled room temperature and protected from light by storing in the original carton.<sup>3004</sup> Ceftazidime–avibactam sodium is a white to yellow powder that ultimately forms a clear to light yellow solution upon reconstitution and subsequent dilution.<sup>3004</sup> After reconstitution with an appropriate diluent as instructed, the drug may be stored for no longer than 30 minutes prior to dilution.<sup>3004</sup> Following dilution, the drug should be used within 12 hours when stored at room temperature; alternatively, the diluted solution may be stored up to 24 hours at 2 to 8°C and then should be used within 12 hours of subsequent storage at room temperature.<sup>3004</sup>

## Ceftolozane Sulfate-Tazobactam Sodium

AHFS 8:12.06.12

### Products

The fixed combination of ceftolozane sulfate–tazobactam sodium is available as a lyophilized powder for injection in single-use (preservative-free) vials containing 1.5 g (ceftolozane 1 g as the sulfate plus tazobactam 0.5 g as the sodium salt).<sup>2958</sup> Each vial also contains sodium chloride 487 mg, citric acid 21 mg, and L-arginine approximately 600 mg.<sup>2958</sup>

Reconstitute each 1.5-g vial with 10 mL of sterile water for injection or sodium chloride 0.9% and gently shake to dissolve.<sup>2958</sup> The reconstituted solution is *not* suitable for direct injection.<sup>2958</sup>

The manufacturer's instructions for preparing various dosages of ceftolozane–tazobactam from the reconstituted solution are as follows:<sup>2958</sup>

For a 3-g dose (ceftolozane 2 g plus tazobactam 1 g), withdraw the entire contents of 2 vials (i.e., approximately 11.4 mL per vial).

For a 2.25-g dose (ceftolozane 1.5 g plus tazobactam 0.75 g), withdraw the entire contents of 1 vial (i.e., approximately 11.4 mL) and 5.7 mL from a second vial.

For a 1.5-g dose (ceftolozane 1 g plus tazobactam 0.5 g), withdraw the entire contents of 1 vial (i.e., approximately 11.4 mL).

For a 750-mg dose (ceftolozane 500 mg plus tazobactam 250 mg), withdraw 5.7 mL.

For a 450-mg dose (ceftolozane 300 mg plus tazobactam 150 mg), withdraw 3.5 mL.

For a 375-mg dose (ceftolozane 250 mg plus tazobactam 125 mg), withdraw 2.9 mL.

For a 150-mg dose (ceftolozane 100 mg plus tazobactam 50 mg), withdraw 1.2 mL.

All doses should be added to an infusion bag containing 100 mL of a compatible diluent.

### Trade Name(s)

Zerbaxa

### Administration

Ceftolozane sulfate–tazobactam sodium is administered by intravenous infusion over 1 hour after dilution in an infusion bag containing 100 mL of sodium chloride 0.9% or dextrose 5%.<sup>2958</sup>

### Stability

Intact vials of ceftolozane sulfate–tazobactam sodium should be stored under refrigeration at 2 to 8°C and protected from light.<sup>2958</sup> Ceftolozane sulfate–tazobactam sodium is a white to yellow lyophilized powder that forms a clear, colorless to slightly yellow solution for infusion; variations in color within this range do not affect the potency of the product.<sup>2958</sup> The drug reconstituted as instructed with sterile water for injection or sodium chloride 0.9% may be stored for 1 hour prior to dilution.<sup>2958</sup> Following dilution in sodium chloride 0.9% or dextrose 5%, the drug is stable for 24 hours when stored at room temperature or 7 days when stored under refrigeration at 2 to 8°C.<sup>2958</sup> Neither the reconstituted nor the diluted solutions should be frozen.<sup>2958</sup>

<sup>k</sup> As epinephrine base rather than the salt.

<sup>l</sup> Meropenem component. Meropenem in a 1:1 fixed-ratio concentration with vaborbactam.

**Additional Compatibility Information****Peritoneal Dialysis Solutions**

The fixed combination of ceftolozane sulfate-tazobactam sodium (Merck Sharpe & Dohme) was evaluated for stability in Dianeal with dextrose 1.5% (Baxter), Dianeal with dextrose 2.5% (Baxter), Dianeal with dextrose 4.25% (Baxter), and Extraneal with icodextrin 7.5% (Baxter) at ceftolozane and tazobactam concentrations of 20 and 10 mg/L, respectively, with bags stored at 25, 4, and 37°C.<sup>3565</sup> The fixed combination also was evaluated for stability in 2-compartment pH-neutral Balance with dextrose 1.3% (Fresenius), pH-neutral Balance with dextrose 2.3% (Fresenius), Physioneal with 1.36% dextrose (Baxter), Physioneal with 2.27% dextrose (Fresenius), and Physioneal with 3.86% dextrose (Fresenius).<sup>3565</sup> Bags of 2-compartment pH-neutral Balance

contained ceftolozane and tazobactam at concentrations of 40 and 20 mg/L, respectively, in the non-dextrose compartment for storage at 25 and 4°C; for storage at 37°C, the 2 compartments were combined immediately prior to storage for final ceftolozane and tazobactam concentrations of 20 and 10 mg/L, respectively.<sup>3565</sup> Bags of 2-compartment Physioneal contained ceftolozane and tazobactam at concentrations of 55.1 and 27.5 mg/L, respectively, in the dextrose compartment for storage at 25 and 4°C; for storage at 37°C, the 2 compartments were combined immediately prior to storage for final ceftolozane and tazobactam concentrations of 20 and 10 mg/L, respectively.<sup>3565</sup> No color change or particle formation was noted on visual assessment and no meaningful pH changes occurred.<sup>3565</sup> In all solutions, losses of both drugs were less than 3% in 6 hours at 25°C followed by 7 days at 4°C and an additional 12 hours at 37°C.<sup>3565</sup>

# Ceftriaxone Sodium

AHFS 8:12.06.12

## Products

Ceftriaxone sodium is available in vials containing the equivalent of 250 mg, 500 mg, 1 g, and 2 g of ceftriaxone. It also is available in 1- and 2-g piggyback bottles and 10-g bulk pharmacy containers.<sup>1(9/08)</sup>

For intramuscular use, reconstitute the vials with a compatible diluent in the amounts indicated:<sup>1(9/08)</sup>

Vial Size	Volume of Diluent for 250 mg/mL	Volume of Diluent for 350 mg/mL
250 mg	0.9 mL	a
500 mg	1.8 mL	1 mL
1 g	3.6 mL	2.1 mL
2 g	7.2 mL	4.2 mL

<sup>a</sup> This vial size not recommended for 350-mg/mL concentration because withdrawal of the entire contents may not be possible.

More dilute solutions for intramuscular injection may be prepared if required.<sup>1(9/08)</sup>

For intermittent intravenous infusion, reconstitute the vials with a compatible diluent in the amounts indicated to yield a 100-mg/mL solution:<sup>1(9/08)</sup>

Vial Size	Volume of Diluent
250 mg	2.4 mL
500 mg	4.8 mL
1 g	9.6 mL
2 g	19.2 mL

After reconstitution, withdraw the entire vial contents and further dilute in a compatible infusion solution to the desired concentration. Concentrations between 10 and 40 mg/mL are recommended, but lower concentrations may be used.<sup>1(9/08)</sup>

The piggyback bottles should be reconstituted with 10 or 20 mL of compatible diluent for the 1- or 2-g size, respectively. After reconstitution, further dilution to 50 to 100 mL with a compatible infusion solution is recommended.<sup>1(9/08)</sup>

The bulk pharmacy container should be reconstituted with 95 mL of a compatible diluent. The solution is not for direct administration and must be diluted further before use.<sup>4</sup>

Ceftriaxone sodium (Braun) is available as 1 or 2 g in a dual-chamber flexible container. The diluent chamber contains dextrose solution.<sup>1(9/08)</sup>

Ceftriaxone sodium also is available as a frozen premixed infusion solution of 1 or 2 g in 50 mL of dextrose 3.8 or 2.4%, respectively, in water. It should be thawed at room temperature.<sup>1(9/08)</sup> <sup>4</sup>

## pH

The pH of the reconstituted drug in dual-chamber containers is approximately 6.7.<sup>1(9/08)</sup> The frozen premixed infusion solutions have a pH of approximately 6.6 (range 6 to 8).<sup>4</sup>

## Osmolality

The frozen premixed infusion solutions have osmolalities of 276 to 324 mOsm/kg.<sup>4</sup>

The osmolality of ceftriaxone sodium (Roche) 50 mg/mL was determined to be 351 mOsm/kg in dextrose 5% and 364 mOsm/kg in sodium chloride 0.9%.<sup>1375</sup>

Ceftriaxone sodium (Braun) 1 or 2 g in dual-chamber flexible containers has an osmolality of 290 mOsm/kg when activated with the dextrose diluent.<sup>1(9/08)</sup>

## Sodium Content

Ceftriaxone sodium contains approximately 3.6 mEq (83 mg) of sodium per gram of ceftriaxone activity.<sup>1(9/08)</sup>

## Trade Name(s)

Rocephin

## Administration

Ceftriaxone sodium is administered by deep intramuscular injection or intermittent intravenous infusion over 15 to 30 minutes in adults or over 10 to 30 minutes in pediatric patients.<sup>1(9/08)</sup> <sup>4</sup>

## Stability

Intact vials of ceftriaxone sodium should be stored at room temperature of 25°C or below and protected from light. After reconstitution, normal exposure to light is permitted. Solutions may vary from light yellow to amber, depending on length of storage, diluent, and concentration.<sup>1(9/08)</sup>

Reconstituted solutions of ceftriaxone sodium are stable, exhibiting less than a 10% potency loss for the time periods indicated:<sup>1(9/08)</sup>

Diluent	Ceftriaxone Concentration (mg/mL)	25°C	4°C
Sterile water for injection	100	2 days	10 days
Sterile water for injection	250, 350	24 hr	3 days
Sodium chloride 0.9%	100	2 days	10 days
Sodium chloride 0.9%	250, 350	24 hr	3 days
Dextrose 5%	100	2 days	10 days
Dextrose 5%	250, 350	24 hr	3 days
Bacteriostatic water for injection (benzyl alcohol 0.9%)	100	24 hr	10 days

Diluent	Ceftriaxone Concentration (mg/mL)	25°C	4°C
Bacteriostatic water for injection (benzyl alcohol 0.9%)	250, 350	24 hr	3 days
Lidocaine HCl 1% (without epinephrine)	100	24 hr	10 days
Lidocaine HCl 1% (without epinephrine)	250, 350	24 hr	3 days

Ceftriaxone sodium (Braun) 1 or 2 g in dual-chamber flexible plastic containers with dextrose solution diluent should be used within 24 hours after activation if stored at room temperature and in 7 days if stored under refrigeration.<sup>1(9/08)</sup>

Ceftriaxone sodium at concentrations of 10 to 40 mg/mL is incompatible with calcium-containing solutions, including Ringer's injection and Ringer's injection, lactated. Precipitation has been observed to form rapidly.<sup>2222</sup> Fatalities in neonates and infants have been reported to the FDA.

The FDA states that ceftriaxone sodium and calcium-containing solutions should not be given concomitantly to neonates less than 28 days of age; ceftriaxone sodium should not be used in these neonates if they are receiving or expected to receive calcium-containing intravenous solutions.<sup>2731 2784</sup>

For patients over 28 days of age, the FDA states that ceftriaxone sodium and calcium-containing intravenous solutions may be administered sequentially as long as the infusion lines are thoroughly flushed between the separate infusions. The FDA states that ceftriaxone sodium and calcium-containing intravenous solutions should not be given simultaneously via Y-site to any patient regardless of age.<sup>2731 2784</sup>

### pH Effects

The pH of maximum stability for ceftriaxone sodium has been variously reported as 2.5 to 4.5<sup>1080</sup> and 7.2.<sup>1244</sup>

### Freezing Solutions

The manufacturer indicates that ceftriaxone sodium 10 to 40 mg/mL in dextrose 5% or sodium chloride 0.9%, when frozen at -20°C in polyvinyl chloride (PVC) or polyolefin containers, is stable for 26 weeks. Thawing should be performed at room temperature; thawed solutions should not be refrozen.<sup>1(9/08)</sup>

The frozen premixed infusion solutions are stable for at least 90 days at -20°C. Thawed solutions are stable for 72 hours at room temperature or 21 days at 5°C.<sup>4</sup>

Ceftriaxone sodium (Roche) 250 and 450 mg/mL in dextrose 5%, 250 mg/mL in bacteriostatic water for injection, and 450 mg/mL in lidocaine hydrochloride 1% (Lyphomed) were evaluated for stability and pharmaceutical integrity during frozen storage at -15°C. The solutions were packaged in 10-mL

polypropylene syringes with attached needles (Becton Dickinson) and frozen for 8 weeks. Some syringes were stored further at 4°C for 10 days for at 20°C for 3 days. Ceftriaxone sodium losses of 5% or less were found after 8 weeks of frozen storage. However, particulate matter levels were unacceptable in most samples. While additional storage at 4°C for 10 days did not cause unacceptable drug loss, storage at 20°C for 3 days resulted in 12% drug loss.<sup>1824</sup>

Ceftriaxone sodium (Roche) 2 g/100 mL of dextrose 5% in polyolefin containers was found to remain stable for 14 weeks frozen at -20°C with no loss of drug occurring. Subsequent thawing in a microwave oven and storage at about 4°C resulted in 10% drug loss in 44 to 56 days, depending on the power level used for thawing.<sup>2724</sup>

Ceftriaxone sodium (Braun) 1 or 2 g in dual-chamber flexible containers should not be frozen.<sup>1(9/08)</sup>

### Syringes

Bailey et al. reported the stability of ceftriaxone sodium (Roche) 10 and 40 mg/mL in dextrose 5% and sodium chloride 0.9% packaged in polypropylene syringes. The solutions were visually compatible and lost 5% or less ceftriaxone in 48 hours at 4 and 20°C and 10 days stored frozen at -10°C.<sup>1720</sup>

Plumridge et al. reported on the stability of ceftriaxone sodium (Roche) 100 mg/mL in sterile water for injection packaged in polypropylene syringes (Terumo). About 9 to 10% loss of ceftriaxone occurred in 5 days at 20°C and 40 days at 4°C. However, the room temperature samples underwent color intensification that the authors found unacceptable after about 72 hours. Little or no loss occurred during 180 days of frozen storage at -20°C.<sup>1990</sup>

O'Connell et al. evaluated the stability of reconstituted ceftriaxone sodium 100 mg/mL packaged in 10-mL polypropylene syringes. Stored under refrigeration at 8°C, about 5% loss occurred in 10 days and 8% in 13 days.<sup>1999</sup>

### Elastomeric Reservoir Pumps

Ceftriaxone sodium (Roche) 10 mg/mL in both dextrose 5% and sodium chloride 0.9% was evaluated for binding potential to natural rubber elastomeric reservoirs (Baxter). No binding was found after storage for 2 weeks at 35°C with gentle agitation.<sup>2014</sup>

### Central Venous Catheter

Ceftriaxone sodium (Roche) 5 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

## Compatibility Information

### Solution Compatibility

#### Ceftriaxone sodium

Test Soln Name	Mfr	Mfr	Conc/L or %	Remarks	Ref	C/I
Dextrose 5% in sodium chloride 0.45%		RC	10 to 40 g	Less than 10% loss in 2 days at 25°C. Incompatible if refrigerated	1(9/08)	C
Dextrose 5% in sodium chloride 0.45%		RC	10 g	3% loss in 48 hr at 20°C. 5% loss in 72 hr and 9% in 96 hr at 4°C	965	C
Dextrose 5% in sodium chloride 0.9%		RC	10 to 40 g	Less than 10% loss in 2 days at 25°C. Incompatible if refrigerated	1(9/08)	C
Dextrose 5%		RC	10 to 40 g	Less than 10% loss in 2 days at 25°C and 10 days at 4°C	1(9/08)	C
Dextrose 5%		RC	10 g	No loss in 48 hr and 8% in 72 hr at 20°C. 4% loss in 72 hr and 9% in 96 hr at 4°C	965	C
Dextrose 5%	TR <sup>b</sup>	RC	2 g	Little or no loss in 14 days at 20, 4, and –20°C	966	C
Dextrose 5%	MG <sup>c</sup>	RC	20 g	Physically compatible with 5% drug loss in 24 hr and 9% in 48 hr at 25°C	1026	C
Dextrose 5%	<sup>b</sup>	RC	40 g	Physically compatible with 12% loss in 3 days at 23°C and 10% loss in 14 days at 4°C	1243	C
Dextrose 5%	<sup>a</sup>	RC	1 g	10% loss calculated to occur in 48 hr at 20°C	1244	C
Dextrose 5%		RC	10 g	Physically compatible with 8% loss in 7 days at room temperature. 5 to 8% loss in 12 weeks at 5 and –20°C	1245	C
Dextrose 5%		RC	50 g	Physically compatible with no loss in 24 hr but 12 to 17% loss in 7 days at room temperature. 5 to 7% loss in 12 weeks at 5 and –20°C	1245	C
Dextrose 5%	BA <sup>d</sup>	RC	5 and 40 g	Less than 10% loss in 4 days at 23°C and 21 days at 4°C	2819	C
Dextrose 5%			5 and 40 g	Color darkening occurs but only about 3% ceftriaxone loss occurs in 20 days at 4°C	2598	C
Dextrose 10%		RC	10 to 40 g	Less than 10% loss in 2 days at 25°C and 10 days at 4°C	1(9/08)	C
Dextrose 10%		RC	10 g	No loss in 48 hr and 8% in 72 hr at 20°C. 2% loss in 72 hr and 8% in 96 hr at 4°C	965	C
Ionosol B in dextrose 5%		RC	10 to 40 g	Less than 10% loss in 24 hours at 25°C	1(9/08)	C
Normosol M in dextrose 5%	<sup>a</sup>	RC	1 to 40 g	Less than 10% loss in 24 hours at 25°C	1(9/08)	C
Ringer's injection, lactated		RC	10 and 13 g	Precipitate forms relatively rapidly	2222	I
Sodium chloride 0.9%		RC	10 to 40 g	Less than 10% loss in 2 days at 25°C and 10 days at 4°C	1(9/08)	C
Sodium chloride 0.9%		RC	10 g	4% loss in 48 hr and 14% in 72 hr at 20°C. 3% loss in 48 hr and 9% in 72 hr at 4°C	965	C
Sodium chloride 0.9%	MG <sup>c</sup>	RC	20 g	Physically compatible with 10% drug loss in 24 hr and 16% in 48 hr at 25°C under fluorescent light	1026	C
Sodium chloride 0.9%	<sup>b</sup>	RC	40 g	Physically compatible with 5% loss in 3 days at 23°C and 9% loss in 30 days at 4°C	1243	C
Sodium chloride 0.9%	<sup>a</sup>	RC	1 g	10% loss calculated to occur in 10 days at 20°C	1244	C
Sodium chloride 0.9%		RC	10 g	Physically compatible with 9% loss in 7 days at room temperature. 11 to 12% loss in 6 weeks at 5°C	1245	C
Sodium chloride 0.9%		RC	50 g	Physically compatible with 8 to 9% loss in 7 days at room temperature. 5% loss in 5 weeks and 15% in 8 weeks at 5°C	1245	C
Sodium chloride 0.9%			5 and 40 g	Color darkening occurs but only about 3% ceftriaxone loss occurs in 20 days at 4°C	2598	C

## Cefuroxime Sodium

AHFS 8:12.06.08

### Products

Cefuroxime sodium is available in vials containing 750 mg and 1.5 g of cefuroxime as the sodium salt.<sup>3567</sup>

For intravenous administration, the 750-mg and 1.5-g vials should be reconstituted with 8.3 and 16 mL, respectively, of sterile water for injection to yield a solution with an approximate cefuroxime concentration of 90 mg/mL.<sup>3567</sup>

For intramuscular administration, the 750-mg vial only should be reconstituted with 3 mL of sterile water for injection to yield a suspension with an approximate cefuroxime concentration of 225 mg/mL.<sup>3567</sup> The suspension should be dispersed with shaking before the dose is withdrawn.<sup>3567</sup>

### pH

The pH of freshly reconstituted solutions ranges from 6 to 8.5.<sup>3567</sup>

### Osmolality

The osmolality of cefuroxime sodium (Glaxo) diluted to a cefuroxime concentration of 30 mg/mL in dextrose 5% was determined to be 315 mOsm/kg and in sodium chloride 0.9% was determined to be 314 mOsm/kg. At a cefuroxime concentration of 50 mg/mL, the osmolality was determined to be 329 mOsm/kg in dextrose 5% and 335 mOsm/kg in sodium chloride 0.9%.<sup>1375</sup>

The following maximum cefuroxime concentrations were recommended to achieve osmolalities suitable for peripheral infusion in fluid-restricted patients:<sup>1180</sup>

Diluent	Maximum Concentration (mg/mL)	Osmolality (mOsm/kg)
Dextrose 5%	76	568
Sodium chloride 0.9%	68	541
Sterile water for injection	137	489

### Sodium Content

Cefuroxime sodium (Teligent) vials contain approximately 2.4 mEq (54.2 mg) of sodium per gram of cefuroxime.<sup>3567</sup>

### Trade Name(s)

Kefurox, Zinacef

### Administration

Cefuroxime sodium is administered by deep intramuscular injection, by direct intravenous injection over 3 to 5 minutes directly into the vein or into the tubing of a running infusion solution, by intermittent intravenous infusion, or by continuous intravenous infusion.<sup>3567</sup> The manufacturer recommends temporarily discontinuing any other solutions infusing at the same site when administering the drug by Y-site infusion.<sup>3567</sup>

### Stability

Intact vials of cefuroxime sodium should be stored at 15 to 30°C and protected from light.<sup>3567</sup> The drug is present as a white to off-white powder.<sup>3567</sup> Solutions may range in color from light yellow to amber, depending on the concentration and diluent used.<sup>3567</sup> Cefuroxime sodium powder and solutions and suspensions prepared from cefuroxime sodium tend to darken, depending on storage conditions, without affecting their potency.<sup>3567</sup>

The reconstituted suspension for intramuscular injection and solution for intravenous administration prepared as directed are stable for 24 hours at room temperature and 48 hours refrigerated at 5°C.<sup>3567</sup>

### pH Effects

The pH of maximum stability is in the range of 4.5 to 7.3.<sup>712</sup>

### Freezing Solutions

Solutions of cefuroxime prepared as directed by reconstituting 750-mg or 1.5-g vials and immediately adding the reconstituted solution to 50 or 100 mL of sodium chloride 0.9% or dextrose 5% in a compatible container are stable for 6 months at -20°C.<sup>3567</sup> The manufacturer states that frozen solutions should be thawed at room temperature; the use of water baths or microwaves for force thawing is not recommended.<sup>3567</sup> Following thawing at room temperature, the solutions are stable for 24 hours at room temperature or 7 days under refrigeration.<sup>3567</sup> Thawed solutions should not be refrozen.<sup>3567</sup>

Minibags of cefuroxime sodium in dextrose 5% or sodium chloride 0.9% were frozen at -20°C for up to 35 days and subsequently thawed at room temperature and in a microwave oven with care taken that the thawed solution temperature never exceeded 25°C. No significant differences in cefuroxime concentrations occurred between the thawing methods.<sup>1192</sup>

Cefuroxime sodium (Glaxo) diluted to cefuroxime concentrations of 30 and 60 mg/mL in sterile water for injection in polyvinyl chloride (PVC) portable infusion pump reservoirs (Pharmacia Deltec) and glass vials exhibited a 4% loss after 30 days at -20°C. Subsequent storage for 4 days at 3°C resulted in about a 10% loss in the PVC bags and a 4% loss in the glass vials.<sup>1581</sup>

Cefuroxime sodium diluted to a cefuroxime concentration of 15 mg/mL (i.e., 1.5 g/100 mL) in dextrose 5% in polyolefin bags was reported to be physically and chemically stable for 98 days stored at -20°C. Less than 10% drug loss occurred upon microwave thawing and subsequent refrigerated storage for 18 to 21 days.<sup>2592</sup>

Cefuroxime sodium (Panpharma) diluted to a cefuroxime concentration of 10 mg/mL in sodium chloride 0.9% and stored in polypropylene syringes (Becton Dickinson) protected from light at -20°C was stable for 365 days.<sup>3271</sup>

## Syringes

Cefuroxime sodium (Panpharma) diluted to a cefuroxime concentration of 10 mg/mL in sodium chloride 0.9% and stored in polypropylene syringes (Becton Dickinson) protected from light at 5°C and 25°C with 60% relative humidity was stable for 21 days and 9 hours, respectively.<sup>3271</sup>

Cefuroxime sodium (GlaxoSmithKline) diluted to a cefuroxime concentration of 90 mg/mL in sodium chloride 0.9% was stored as 50 mL in 50-mL polypropylene syringes.<sup>3566</sup> Syringes stored at 2 to 8°C protected from light demonstrated less than 4% loss in theoretical concentration in 14 days with no significant change in physical appearance.<sup>3566</sup> Syringes stored at 20 to 25°C both protected from and exposed to light demonstrated less than 10% loss in 2 days; syringes stored without light protection underwent a more intense yellowing in color than did those protected from light.<sup>3566</sup> Syringes stored at 38 to 42°C protected from light exhibited losses of more than 40% of theoretical concentra-

tion after as little as 1 day.<sup>3566</sup> pH of the solutions was not measured.<sup>3566</sup>

## Ambulatory Pumps

Cefuroxime sodium (Glaxo) diluted to cefuroxime concentrations of 22.5 and 45 mg/mL in sterile water for injection in PVC portable infusion pump reservoirs (Pharmacia Deltec) exhibited a 4 to 6% loss in 8 hours and an 11 to 12% loss in 16 hours at 30°C. No loss occurred in 7 days at 3°C.<sup>1581</sup>

## Central Venous Catheter

Cefuroxime sodium (Glaxo Wellcome) diluted to a cefuroxime concentration of 10 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

## Compatibility Information

### Solution Compatibility

#### Cefuroxime sodium

Test Soln Name	Mfr	Mfr	Conc/L or %	Remarks	Ref	C/I
Dextrose 5% in sodium chloride 0.225%		TEL	1 to 30 g	Less than 10% loss in 24 hr at room temperature and 7 days refrigerated	3567	C
Dextrose 5% in sodium chloride 0.45%		TEL	1 to 30 g	Less than 10% loss in 24 hr at room temperature and 7 days refrigerated	3567	C

# Chloramphenicol Sodium Succinate

AHFS 8:12.08

## Products

Chloramphenicol sodium succinate is available in vials containing the equivalent of chloramphenicol 1 g as the sodium succinate salt. The manufacturer recommends reconstitution with 10 mL of an aqueous diluent such as water for injection or dextrose 5% to yield a solution containing 100 mg/mL (10%) of chloramphenicol.<sup>1(4/07) 4</sup>

## pH

From 6.4 to 7.<sup>4 6</sup>

## Osmolality

Chloramphenicol sodium succinate 100 mg/mL in sterile water for injection has an osmolality of 533 mOsm/kg as determined by freezing-point depression.<sup>1071</sup>

The osmolality of chloramphenicol sodium succinate 1 g was calculated for the following dilutions:<sup>1054</sup>

Diluent	Osmolality (mOsm/kg)	
	50 mL	100 mL
Dextrose 5%	341	303
Sodium chloride 0.9%	368	330

The osmolality of chloramphenicol sodium succinate (Parke-Davis) 20 mg/mL was determined to be 330 mOsm/kg in dextrose 5% and 344 mOsm/kg in sodium chloride 0.9%. At 50 mg/mL, the osmolality was determined to be 417 and 422 mOsm/kg, respectively.<sup>1375</sup>

The following maximum chloramphenicol sodium succinate concentrations were recommended to achieve osmolalities suitable for peripheral infusion in fluid-restricted patients:<sup>1180</sup>

## Sodium Content

Chloramphenicol sodium succinate contains 2.25 mEq (52 mg) of sodium per gram of drug.<sup>1(4/07) 4</sup>

## Administration

Chloramphenicol sodium succinate injection at a concentration not exceeding 100 mg/mL may be administered by direct intravenous injection over at least 1 minute.<sup>1(4/07) 4</sup>

## Stability

Intact vials should be stored at controlled room temperature. The reconstituted solution is stable for 30 days at room temperature.<sup>4 6</sup> Cloudy solutions should not be used.<sup>4</sup>

## pH Effects

Chloramphenicol is stable over a pH range of 2 to 7, with maximum stability at pH 6.<sup>1072</sup> Chloramphenicol activity was retained for 24 hours at pH 3.6 to 7.5 in dextrose 5%.<sup>6</sup>

## Sorption

Chloramphenicol sodium succinate was shown not to exhibit sorption to PVC bags and tubing, polyethylene tubing, Silastic tubing, and polypropylene syringes.<sup>536 606</sup>

## Chlorothiazide Sodium

AHFS 40:28.20

### Products

Chlorothiazide sodium is supplied in vials containing lyophilized drug equivalent to 500 mg of chlorothiazide with mannitol 250 mg and sodium hydroxide to adjust the pH.<sup>3132 3133</sup> Each vial should be reconstituted with 18 mL of sterile water for injection to obtain an isotonic solution yielding a concentration of 28 mg/mL of drug.<sup>3132 3133</sup> No less than 18 mL of sterile water for injection should be used for reconstitution.<sup>3132 3133</sup>

### pH

From 9.2 to 10.<sup>7</sup>

### Trade Name(s)

Sodium Diuril

### Administration

Chlorothiazide sodium is administered intravenously by direct injection or infusion.<sup>3132 3133</sup> It should not be administered intramuscularly or subcutaneously, and extravasation must be avoided.<sup>3132 3133</sup>

### Stability

Intact vials should be stored between 2 and 25°C<sup>3133</sup> or between 20 and 25°C at controlled room temperature;<sup>3132</sup> specific product labeling should be consulted for details. Vials are intended for single dose only and unused portions of the reconstituted solution should be discarded. The manufacturers state that the solution should be used immediately after reconstitution.<sup>3132 3133</sup> However, the reconstituted solution has been stated to be stable for 24 hours.<sup>7</sup>

Chlorothiazide sodium (APP) reconstituted with bacteriostatic water for injection, diluted in dextrose 5% to a chlorothiazide concentration of 10 mg/mL, and packaged as 10 mL in 15-mL polypropylene tubes (BD Biosciences) was physically compatible with less than 6% loss of chlorothiazide in 48 hours at 25°C in the dark.<sup>3568</sup>

### pH Effects

Chlorothiazide sodium appears to be stable at pH 7.5 to 9.5 in dextrose 5%.<sup>7</sup> No loss of potency was noted over a 24-hour study period.<sup>7</sup>

The solubility of chlorothiazide sodium is very pH sensitive.<sup>7</sup> Depending on concentration, precipitation occurs at approximately pH 7.4 and below.<sup>7</sup> Additives that result in a final pH in this range should not be mixed.<sup>7</sup> Chlorothiazide sodium is sufficiently alkaline to raise the pH of unbuffered solutions such as dextrose, saline, and their combinations;<sup>7</sup> however, if an acidic buffer is present, such as lactate or acetate buffers, the resultant pH may fall below pH 7.4, causing precipitation.<sup>7</sup>

Chlorothiazide sodium possesses some alkalizing power.<sup>7</sup> Therefore, it should not be combined with drugs known to be unstable in alkaline media.<sup>7</sup>

### Syringes

Chlorothiazide (APP) 25 mg/mL (as the sodium salt) diluted in sterile water for injection was packaged as 0.5 mL in 1-mL polypropylene syringes (Monoject) sealed with luer-tip caps (Becton Dickinson) and stored at 2 to 8°C protected from light for 10 days.<sup>3134</sup> Neither changes in color or clarity nor appreciable changes in pH from baseline values occurred.<sup>3134</sup> Samples exhibited a loss of approximately 8% by 6 days.<sup>3134</sup>

<sup>a</sup> Refer to Appendix for the composition of the parenteral nutrition solutions. TPN indicates a 2-in-1 admixture.

<sup>b</sup> Tested in either dextrose 5% or in sodium chloride 0.9%, but the report did not specify which solution.

<sup>c</sup> Tested in a 1:1 mixture of (1) dextrose 5% and dextrose 5% in sodium chloride 0.45% with and without potassium chloride 20 mEq/L and also in (2) dextrose 10% in sodium chloride 0.45% with and without potassium chloride 20 mEq/L.

# Chlorpromazine Hydrochloride

AHFS 28:16.08.24

## Products

Chlorpromazine hydrochloride 25 mg/mL is available in 1- and 2-mL ampuls and vials. Each mL of solution also contains ascorbic acid 2 mg, sodium metabisulfite 1 mg, sodium sulfite 1 mg, and sodium chloride 6 mg in water for injection.<sup>1(10/06)</sup>

## pH

From 3.4 to 5.4.<sup>1(10/06) 17</sup>

## Administration

Chlorpromazine hydrochloride may be administered slowly by deep intramuscular injection into the upper outer quadrant of the buttock. Dilution with sodium chloride 0.9% or procaine hydrochloride 2% (no longer commercially available in the US) has been recommended for intramuscular injection if local irritation is a problem. Subcutaneous injection is not recommended. The drug may be diluted to 1 mg/mL with sodium chloride 0.9% and administered by direct intravenous injection at a rate of 1 mg/min to adults and 0.5 mg/min to children. For infusion, it may be diluted in 500 to 1000 mL of sodium chloride 0.9%.<sup>1(10/06) 4</sup>

## Stability

Intact containers should be stored at controlled room temperature. Freezing should be avoided. Protect the solution from light during storage or it may discolor. A slightly yellowed solution does not indicate potency loss. However, a markedly discolored solution should be discarded.<sup>1(10/06)</sup>

## pH Effects

The pH of maximum stability is 6.<sup>67</sup> Oxidation of chlorpromazine hydrochloride occurs in alkaline media.<sup>4</sup> The titration of chlorpromazine hydrochloride in sodium chloride 0.9% with alkali resulted in precipitation of chlorpromazine base at pH 6.7 to 6.8.<sup>138</sup> Precipitation may occur if chlorpromazine hydrochloride is admixed with alkaline drugs or solutions.

## Light Effects

Chlorpromazine hydrochloride ampuls and vials should be protected from light during storage.<sup>1(10/06) 4</sup> However, chlorpromazine hydrochloride infusion solutions in polyvinyl chloride (PVC) bags exposed to light during administration lost less than 2% of the drug over a 6-hour administration period. Light protection of infusion sets during administration was found not to be necessary.<sup>2280</sup>

## Sorption

Chlorpromazine hydrochloride (May & Baker) 9 mg/L in sodium chloride 0.9% (Travenol) in PVC bags exhibited only about 5% sorption to the plastic bag during 1 week of storage at room temperature (15 to 20°C). However, when the solution was buffered from its initial pH of 5 to pH 7.4, approximately 86% of the drug was lost in 1 week due to sorption.<sup>536</sup>

Chlorpromazine hydrochloride (May & Baker) 9 mg/L in sodium chloride 0.9% exhibited a cumulative 41% loss due to sorption during a 7-hour simulated infusion through an infusion set (Travenol) consisting of a cellulose propionate burette chamber and 170 cm of PVC tubing. Both the burette chamber and the tubing contributed to the loss. The extent of sorption was found to be independent of concentration.<sup>606</sup>

The drug also was tested as a simulated infusion over at least 1 hour by a syringe pump system. A glass syringe on a syringe pump was fitted with 20 cm of polyethylene tubing or 50 cm of Silastic tubing. A negligible amount of drug was lost with the polyethylene tubing, but a cumulative loss of 79% occurred during the 1-hour infusion through the Silastic tubing.<sup>606</sup>

A 25-mL aliquot of chlorpromazine hydrochloride 9 mg/L in sodium chloride 0.9% was stored in all-plastic syringes composed of polypropylene barrels and polyethylene plungers for 24 hours at room temperature in the dark. The solution did not exhibit any loss due to sorption.<sup>606</sup>

In a continuation of this work, chlorpromazine hydrochloride (May & Baker) 90 mg/L in sodium chloride 0.9% in a glass bottle was delivered through a polyethylene administration set (Tridilset) over 8 hours at 15 to 20°C. The flow rate was set at 1 mL/min. No appreciable loss due to sorption occurred.<sup>769</sup> This finding is in contrast to a 41% loss using a conventional administration set.<sup>606</sup>

## Central Venous Catheter

Chlorpromazine hydrochloride (Elkins-Sinn) 2 mg/mL in dextrose 5% was found to be compatible with the ARROW-g+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

<sup>i</sup> Test performed using the formulation WITH edetate disodium.

**Additional Compatibility Information****Hydroxyzine and Meperidine**

Chlorpromazine hydrochloride (Elkins-Sinn) 6.25 mg/mL, hydroxyzine hydrochloride (Pfizer) 12.5 mg/mL, and meperidine hydrochloride (Winthrop) 25 mg/mL, in both glass and plastic syringes, have been reported to be physically compatible and chemically stable for at least 1 year at 4 and 25°C when protected from light.<sup>989</sup>

**Meperidine and Promethazine**

Chlorpromazine hydrochloride, meperidine hydrochloride, and promethazine hydrochloride combined as an extemporaneous

mixture for preoperative sedation, developed a brownish-yellow color after 2 weeks of storage with protection from light. The discoloration was attributed to the metacresol preservative content of the meperidine hydrochloride product used. Use of meperidine hydrochloride which contains a different preservative resulted in a solution that remained clear and colorless for at least 3 months when protected from light.<sup>1148</sup>

**Chlorocresol**

Chlorpromazine hydrochloride is incompatible with chlorocresol preservative.<sup>467 468</sup>

# Cidofovir

AHFS 8:18.32

## Products

Cidofovir is available in single-use (unpreserved) 5-mL vials.<sup>2924 2925</sup> Each mL contains cidofovir 75 mg with sodium hydroxide and/or hydrochloric acid to adjust pH.<sup>2924 2925</sup> The drug must be diluted in 100 mL of sodium chloride 0.9% prior to administration.<sup>2924 2925</sup>

Take appropriate safety precautions for handling mutagenic substances in accordance with current guidelines and manufacturers' safe handling guidance.<sup>2924 2925</sup> If cidofovir solution contacts skin or mucosa, wash the affected area immediately with soap and water.<sup>2924 2925</sup>

Partially used vials, diluted solutions, and materials used in admixture preparation and administration should be sealed in leak- and puncture-proof containers and incinerated at high temperature.<sup>2924 2925</sup>

## pH

Cidofovir has a pH adjusted to 7.4<sup>2924</sup> or from 7.1 to 7.7.<sup>2925</sup>

The pH values of cidofovir admixtures in three infusion solutions were:<sup>1963</sup>

Solution	Concentration	pH
Dextrose 5% in sodium chloride 0.45%	0.085 and 3.51 mg/mL	6.7 to 7
Dextrose 5%	0.21 and 8.12 mg/mL	7.2 to 7.6
Sodium chloride 0.9%	0.21 and 8.12 mg/mL	7.1 to 7.5

## Osmolality

Cidofovir is hypertonic and is diluted for administration.<sup>2924</sup> The osmolalities of cidofovir admixtures in three infusion solutions were:<sup>1963</sup>

Solution	Concentration	Osmolality (mOsm/kg)
Dextrose 5% in sodium chloride 0.45%	0.085 and 3.51 mg/mL	382 and 392
Dextrose 5%	0.21 and 8.12 mg/mL	241 and 286
Sodium chloride 0.9%	0.21 and 8.12 mg/mL	275 and 315

## Trade Name(s)

Vistide

## Administration

Cidofovir is administered by intravenous infusion in 100 mL of sodium chloride 0.9% at a constant rate over one hour.<sup>2924 2925</sup> Use of an infusion pump is recommended for administration.<sup>2924 2925</sup> Shorter periods must not be used.<sup>2924 2925</sup> Patients must be hydrated with at least 1 L of intravenous sodium chloride 0.9% infused over 1 to 2 hours immediately prior to each cidofovir infusion.<sup>2924 2925</sup> In patients who can tolerate additional hydration, a second liter of intravenous sodium chloride 0.9% should be infused over 1 to 3 hours, either at the start of the cidofovir infusion or immediately afterwards.<sup>2924 2925</sup> Patients must also be treated with oral probenecid with each infusion of cidofovir.<sup>2924 2925</sup>

Intraocular administration of cidofovir is contraindicated.<sup>2924 2925</sup>

## Stability

Cidofovir should be stored at controlled room temperature.<sup>2924 2925</sup> If any particulate matter or discoloration is present, the vial should be discarded.<sup>2924 2925</sup> The manufacturer states that, diluted in 100 mL of sodium chloride 0.9% for administration, cidofovir should be used within 24 hours of preparation.<sup>2924 2925</sup> Admixtures not used immediately should be stored under refrigeration at 2 to 8°C but should still be used within 24 hours of preparation; refrigeration or freezing should not be used to extend beyond the 24-hour limit.<sup>2924 2925</sup> Refrigerated admixtures should be allowed to come to room temperature prior to use.<sup>2924 2925</sup>

## Syringes

Cidofovir 6.25 mg/mL in sodium chloride 0.9% packaged in polypropylene syringes (Becton Dickinson) has been reported to be stable by HPLC analysis for 150 days at room and refrigeration temperatures.<sup>2607</sup>

## Scorption

Cidofovir is stated to be compatible with glass, PVC, and ethylene/propylene copolymer infusion solution containers.<sup>2924 2925</sup>

# Ciprofloxacin

AHFS 8:12.18

## Products

Ciprofloxacin is available as a premixed, ready-to-use solution in 100- and 200-mL polyvinyl chloride (PVC) containers. Each mL contains 2 mg of ciprofloxacin with dextrose 5%, lactic acid as a solubilizer, and hydrochloric acid to adjust the pH.<sup>1(10/08)</sup>

## pH

From 3.5 to 4.6.<sup>1(10/08) 17</sup>

## Trade Name(s)

Cipro I.V.

## Administration

Ciprofloxacin is administered at a concentration of 1 to 2 mg/mL by intravenous infusion into a large vein slowly over 60 minutes. When given intermittently through a Y-site, the primary solution should be discontinued temporarily.<sup>1(10/08) 4</sup>

## Stability

Ciprofloxacin is a clear, colorless to slightly yellow solution. It should be stored between 5 and 25°C and protected from light and freezing.<sup>1(10/08) 4</sup>

## pH Effects

Ciprofloxacin in aqueous solution is stated to be stable for up to 14 days at room temperature in the pH range of 1.5 to 7.5.<sup>4</sup> However, Teraoka et al. reported substantial loss of ciprofloxacin content in admixtures with a pH over 6.<sup>1924</sup>

## Light Effects

Ciprofloxacin undergoes slow degradation when exposed to natural daylight. Exposure to mixed natural daylight and fluorescent light resulted in about 2% loss after 12 hours of exposure and about 9% loss after about 96 hours of exposure.<sup>2399</sup>

## Central Venous Catheter

Ciprofloxacin (Bayer) 1 mg/mL in dextrose 5% was found to be compatible with the ARROWgard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

<sup>o</sup> Ceftolozane component. Ceftolozane in a 2:1 fixed-ratio concentration with tazobactam.

<sup>p</sup> Meropenem component. Meropenem in a 1:1 fixed-ratio concentration with vaborbactam.

<sup>q</sup> Run at 25 mL/hr with dextrose 5% run at 83 mL/hr.

<sup>r</sup> Tested as the premixed infusion solution.

**Additional Compatibility Information****Peritoneal Dialysis Solutions**

Ciprofloxacin 25 mg/L in Dianeal 137 peritoneal dialysis solution exhibited little or no loss after 42 days at 4, 22, and 37°C when protected from light.<sup>1585</sup> At 37°C over 48 hours, losses of up to

10% occurred in Dianeal PD-1 with dextrose 1.5%; losses of up to 7% occurred in Dianeal PD-1 with dextrose 4.5%.<sup>1826</sup> Ciprofloxacin 25 and 50 mg/L in Dianeal PD-2 with dextrose 1.5, 2.5, and 4.25% and Extraneal, all solutions both with and without heparin, were found to be stable for 4 days at 38°C.<sup>2686</sup>

## Cisatracurium Besylate

AHFS 12:20.20

### Products

Cisatracurium besylate is available as a 2-mg/mL solution in 5- and 10-mL vials.<sup>2868</sup> The drug is also available as a 10-mg/mL solution in 20-mL vials intended for use in intensive care units only.<sup>2868</sup> The pH is adjusted with benzenesulfonic acid.<sup>2868</sup> The 2-mg/mL concentration in 10-mL vials also contains benzyl alcohol 0.9%.<sup>2868</sup> The other dosage forms have no preservative and are for single use only.<sup>2868</sup>

### pH

From 3.25 to 3.65.<sup>2868</sup>

### Trade Name(s)

Nimbex

### Administration

Cisatracurium besylate is administered intravenously only.<sup>2868</sup> Both initial bolus doses and continuous intravenous infusion have been used.<sup>2868</sup> Rates of administration depend on the drug concentration in the solution, desired dose, and patient weight.<sup>2868</sup> Avoid contact with alkaline drugs during administration.<sup>2868</sup>

### Stability

Cisatracurium besylate injection is a colorless to slightly yellow or greenish-yellow solution.<sup>2868</sup> Intact vials of cisatracurium besylate should be stored at 2 to 8°C protected from light and freezing.<sup>2868</sup> Potency losses of 5% per year occur under refrigeration.<sup>2868</sup> However, at 25°C, potency losses increase to about 5% per month.<sup>2868</sup> The manufacturer recommends that vials that have been warmed to room temperature be used within 21 days even if rerefrigerated.<sup>2868</sup>

In an independent study, cisatracurium besylate 2 mg/mL in 5- and 10-mL vials and the 10-mg/mL solution in 20-mL vials was stored at 4 and 23°C both protected from light and exposed

to fluorescent light. All the samples remained physically stable throughout the 90-day study period. Samples stored under refrigeration exhibited little or no drug loss in 90 days whether exposed to or protected from light. At 23°C, samples were stable through 45 days of storage with losses near 5 to 7% in most samples. However, most samples became unacceptable after 90 days of storage at 23°C, exhibiting losses of 9 to 14%.<sup>2116</sup>

### pH Effects

The manufacturer indicates that cisatracurium besylate may not be compatible with barbiturates and other alkaline solutions having a pH greater than 8.5.<sup>2868</sup>

### Syringes

In 2015, reports of decreased potency of certain drugs (e.g., cisatracurium besylate) stored in Becton Dickinson syringes for extended periods (i.e., exceeding 24 hours) were confirmed by the manufacturer of these syringes; the cause of this change was later identified to be the inclusion of an alternate rubber stopper in the plunger of certain product lots of syringes.<sup>3029 3036 3037 3039 3041 3042</sup> Decreased potency was not observed when the syringes were filled and used promptly.<sup>3037</sup> Use of the alternate stopper was later discontinued and use of the primary stopper in such syringes was resumed; however, Becton Dickinson states that its general-use syringes are cleared by FDA for immediate use in fluid aspiration and injection and that such syringes, regardless of the stopper material, have not been cleared by FDA for use as a closed-container system.<sup>3391</sup>

Cisatracurium besylate 2 mg/mL was repackaged in 3-mL plastic syringes (Becton Dickinson) and sealed with tip caps (Red Cap, Burrion). The syringes were stored at 4 and 23°C both protected from light and exposed to fluorescent light. All of the samples remained physically stable throughout the 30-day study period. Little or no loss occurred when stored under refrigeration, whereas samples stored at 23°C exhibited 4 to 7% loss in 30 days.<sup>2116</sup>

## Compatibility Information

## Cisplatin

### AHFS 10:00

#### Products

Cisplatin is available as a sterile aqueous injection containing cisplatin 1 mg/mL and sodium chloride 9 mg/mL, with hydrochloric acid and/or sodium hydroxide to adjust the pH. This aqueous solution is available in 50-mL (50-mg), 100-mL (100-mg), and 200-mL (200-mg) vials.<sup>1(1/08) 4</sup>

#### pH

From 3.5 to 4.5.<sup>1(1/08)</sup>

#### Osmolality

The aqueous injection has an osmolality of about 285 mOsm/kg.<sup>4</sup>

#### Sodium Content

Each 10 mg of cisplatin contains 1.54 mEq of sodium.<sup>846 869</sup>

#### Administration

Cisplatin is administered by intravenous infusion with a regimen of hydration (with or without mannitol and/or furosemide) prior to therapy. One regimen consists of 1 to 2 L of fluid given over 8 to 12 hours prior to cisplatin administration. In addition, adequate hydration and urinary output must be maintained for 24 hours after therapy. The official labeling recommends diluting the cisplatin dose in 2 L of compatible infusion solution containing mannitol 37.5 g and infusing over 6 to 8 hours.<sup>1(1/08) 4</sup> Other dilutions and rates of administration have been used, including intravenous infusions over periods from 15 to 120 minutes and continuous infusion over 1 to 5 days. Intra-arterial infusion and intraperitoneal instillation have been used.<sup>4</sup>

Because of an interaction occurring between cisplatin and the metal aluminum, only administration equipment such as needles, syringes, catheters, and sets that contain no aluminum should be used for this drug. Aluminum in contact with cisplatin solution will result in a replacement oxidation–reduction reaction, forcing platinum from the cisplatin molecule out of solution and appearing as a black or brown precipitate. Other metal components such as stainless steel needles and plated brass hubs do not elicit an observable reaction within 24 hours.<sup>1(1/08)</sup>  
203 204 512 988

#### Stability

Intact vials of the clear, colorless aqueous injection should be stored between 20 and 25°C and protected from light; they should not be refrigerated.<sup>1(1/08) 4</sup>

After initial vial entry, the aqueous cisplatin injection in amber vials is stable for 28 days if it is protected from light or for 7 days if it is exposed to fluorescent room light.<sup>1(1/08)</sup>

Concern has been expressed that storage of cisplatin solutions for several weeks might result in substantial amounts of the toxic mono- and di-aquo species.<sup>1199</sup> However, the solution's

chloride content, rather than extended storage time periods, appears to determine the extent of aquated product formation. (See Effect of Chloride Ion below.)

Kristjansson et al. evaluated the long-term stability of cisplatin 1 mg/mL in an aqueous solution containing sodium chloride 9 mg/mL and mannitol 10 mg/mL in glass vials. After 22 months at 5°C, the 4% loss of cisplatin could be explained as the expected equilibrium between cisplatin and its aquated products. Furthermore, a precipitate formed and required sonication at 40°C for about 20 to 30 minutes to redissolve. Storage of the cisplatin solution at 40°C for 10 months resulted in no physical change. After an additional 1 year at 5°C, these samples exhibited an average 15% loss, which the authors concluded was not the result of the formation of aquated species or the toxic and inactive oligomeric species. These proposed degradation products were not present in the 40°C sample.<sup>1246</sup>

Theuer et al. reported little or no loss of cisplatin potency, after 27 days at room temperature with protection from light, from a solution of cisplatin 500 mcg/mL in sodium chloride 0.9% at pH 4.75 and 3.25.<sup>1605</sup>

Cisplatin may react with sodium thiosulfate, sodium metabisulfite, and sodium bisulfite in solution, rapidly and completely inactivating the cisplatin.<sup>4 1089 1175</sup>

Cisplatin 1 mg/mL did not support the growth of several microorganisms and may impart an antimicrobial effect at this concentration. Loss of viability was observed for *Staphylococcus aureus*, *Escherichia coli*, *Pseudomonas aeruginosa*, *Pseudomonas cepacia*, *Candida albicans*, and *Aspergillus niger*.<sup>1187</sup>

#### pH Effects

The pH of maximum stability is 3.5 to 5.5. Alkaline media should be avoided because of increased hydrolysis.<sup>1379</sup>

In the dark at pH 6.3, cisplatin (Bristol) 1 mg/mL in sodium chloride 0.9% reached the maximum amount of decomposition product permitted in the *USP* in 34 days. Half of that amount was formed in 96 days at pH 4.3.<sup>1647</sup>

Cisplatin degradation results in ammonia formation, which increases the solution pH. Thus, the initial cisplatin degradation rate may be slow but increases with time.<sup>1647</sup>

#### Temperature Effects

It is recommended that cisplatin not be refrigerated because of the formation of a crystalline precipitate.<sup>1(1/08) 4 633 636 1246</sup> In a study of cisplatin at concentrations of 0.4 to 1 mg/mL in sodium chloride 0.9%, it was found that at 0.6 mg/mL or greater a precipitate formed on refrigeration at 2 to 6°C. At 1 mg/mL the precipitation was noted in 1 hour. However, the 0.6-mg/mL solution did not have a precipitate until after 48 hours under refrigeration. The 0.5-mg/mL and lower solutions did not precipitate for up to 72 hours at 2 to 6°C. In solutions where precipitate did form, redissolution occurred very slowly with warming back to

room temperature.<sup>317</sup> Sonication at 40°C has been used to redissolve the precipitate in about 20 to 30 minutes.<sup>1246</sup> The warming of precipitated cisplatin solutions to effect redissolution is not recommended, however. Solutions containing a precipitate should not be used.<sup>4 633</sup>

### Freezing Solutions

Cisplatin (Bristol) 50 and 200 mg/L in dextrose 5% in sodium chloride 0.45% in polyvinyl chloride (PVC) bags and admixed with either mannitol 18.75 g/L or magnesium sulfate 1 or 2 g/L is reportedly stable for 30 days when frozen at -15°C followed by an additional 48 hours at 25°C.<sup>1088</sup>

### Light Effects

Although changes in the UV spectra of cisplatin solutions on exposure to intense light have long been recognized,<sup>317</sup> their significance was questioned. It was reported that exposure to normal laboratory light for 72 hours had no significant effect on cisplatin's stability.<sup>635</sup>

More recently, however, Zieske et al. reported substantial cisplatin decomposition after exposure to typical laboratory light, a mixture of incandescent and fluorescent illumination. As much as 12% degraded to trichloroamineplatin (II) after 25 hours. Cisplatin was most sensitive to light in the UV to blue region and had little sensitivity to yellow or red light. It was protected from light-induced degradation by low-actinic amber glass flasks but not by PVC bags, clear glass vials, or polyethylene syringes. The authors concluded that exposure to moderately intense white light for more than 1 hour should be avoided.<sup>1647</sup>

The manufacturer recommends that a cisplatin solution removed from its amber vial be protected from light if it is not used within 6 hours. Even in the amber vial, the cisplatin solution should be discarded after 7 days if exposed to fluorescent room light.<sup>1(1/08)</sup>

### Chloride Ion Effects

The stability of cisplatin in solution is dependent on the chloride ion concentration present. Cisplatin is stable in solutions containing an adequate amount of chloride ion but is incompatible in solutions having a low chloride content.<sup>4 316 317 634 635 637</sup>

In solutions with an inadequate chloride content, one or both chloride ions in the cisplatin molecule are displaced by water, forming mono- and di-aquo species. The minimum acceptable chloride ion concentration is about 0.040 mol/L, the equivalent of about 0.2% sodium chloride.<sup>317 634 635</sup>

At a cisplatin concentration of 200 mg/L in sodium chloride 0.9% with the pH adjusted to 4, about 3% decomposition occurs in less than 1 hour at room temperature. An equilibrium is then reached, with the cisplatin remaining stable thereafter. At lesser concentrations of chloride ion, greater decomposition of cisplatin occurs. In sodium chloride 0.45 and 0.2%, approximately 4 and 7% decomposition occurred at equilibrium, respectively. In very low chloride-containing solutions, most of the drug may be decomposed. The decomposition appears to be reversible, with cisplatin being reformed in the presence of high chloride concentrations.<sup>317</sup>

In another study, the stability of cisplatin 50 and 500 mg/L was evaluated in aqueous solutions containing sodium chloride 0.9, 0.45, and 0.1% and also in water over 24 hours at 25°C exposed to light. Approximately 2 and 4% of the cisplatin were lost in the sodium chloride 0.9 and 0.45% solutions, respectively. In the 0.1% solution, about 4 to 10% decomposition occurred in 4 to 6 hours, increasing to approximately 11 to 15% at both 12 and 24 hours. In aqueous solution with no chloride content, cisplatin decomposed rapidly, with about a 30 to 35% loss in 4 hours increasing to a 70 to 80% loss in 24 hours.<sup>635</sup>

### Ambulatory Pumps

Cisplatin (David Bull) reconstituted to concentrations of 1 and 1.6 mg/mL with sterile water for injection was evaluated for stability for 14 days protected from light in Pharmacia Deltec medication cassettes at 24 and 37°C. The 1.6-mg/mL concentration developed a yellow crystalline precipitate rendering it unfit for use. For the 1-mg/mL concentration, little change in cisplatin concentration was found, but water loss due to evaporation was found to be about 1% at 24°C and 3% at 37°C in 14 days.<sup>2319</sup>

### Filtration

Cisplatin 10 to 300 mcg/mL exhibited no loss due to sorption to cellulose nitrate/cellulose acetate ester (Millex OR) or Teflon (Millex FG) filters.<sup>1415 1416</sup>

## Cladribine

### AHFS 10:00

### Products

Cladribine is available as a 1-mg/mL concentrate for injection in single-use preservative-free vials containing 10 mL of the concentrate.<sup>2938</sup> Each mL of the solution contains cladribine 1 mg, sodium chloride 9 mg, and phosphoric acid and/or dibasic sodium phosphate to adjust the pH.<sup>2938</sup> The injection is a concentrate that must be diluted for administration.<sup>2938</sup>

### pH

From 5.5 to 8.<sup>2938</sup>

### Tonicity

Cladribine injection is isotonic.<sup>2938</sup>

### Sodium Content

Each mL of cladribine injection contains 0.15 mEq of sodium.<sup>2938</sup>

### Administration

Cladribine is administered by continuous intravenous infusion over 24 hours after dilution in 500 mL of sodium chloride 0.9% for repeated single daily doses.<sup>2938</sup> Some manufacturers recommend that the injection be passed through a 0.22- $\mu$ m filter prior to being introduced into the infusion bag in the preparation of single daily doses.<sup>2938</sup>

Alternatively, to prepare a solution for 7-day continuous infusion, cladribine should be diluted only in bacteriostatic sodium chloride 0.9% containing benzyl alcohol 0.9%.<sup>2938</sup> The 7-day solution should be prepared by sequentially transferring the volume of the total 7-day dose followed by the calculated volume of solution required to bring the final volume to 100 mL to the pump reservoir through a 0.22- $\mu$ m hydrophilic syringe filter.<sup>2938</sup> Air in the reservoir should be removed by aspiration using a syringe and a new filter or a vent-filter assembly.<sup>2938</sup> The finished preserved solution is then administered continuously over 7 days.<sup>2938</sup>

The use of dextrose 5% as a diluent is not recommended because of an increased rate of cladribine degradation.<sup>2938</sup>

### Stability

Intact cladribine vials should be stored under refrigeration and protected from light.<sup>2938</sup> The solution is clear and colorless.<sup>2938</sup>

Solutions prepared for a single daily dose are stated to be both physically and chemically stable at room temperature under normal lighting conditions for at least 24 hours in polyvinyl chloride (PVC) containers; however, the manufacturers recommend that diluted solutions of cladribine be administered promptly or stored under refrigeration for no more than 8 hours prior to administration.<sup>2938</sup>

A precipitate may develop upon low-temperature storage; the precipitate may be redissolved by allowing the solution to warm to room temperature with vigorous shaking.<sup>2938</sup> Heating the solution is not recommended.<sup>2938</sup> However, less than 5% loss of activity is reported to occur in 7 days when the solution is stored at 37°C.<sup>1369</sup>

Freezing does not adversely affect stability of the product.<sup>2938</sup> Thawing should be allowed to occur naturally by exposure to room temperature.<sup>2938</sup> The vials should not be heated or exposed to microwaves.<sup>2938</sup> After thawing, the vial contents are stable under refrigeration until expiration.<sup>2938</sup> Thawed vials should not be refrozen.<sup>2938</sup>

Cladribine (Ortho Biotech) 0.025 mg/mL in sodium chloride 0.9% did not exhibit an antimicrobial effect on *Enterococcus faecium*, *Staphylococcus aureus*, *Pseudomonas aeruginosa*, and *Candida albicans* inoculated into the solution. Admixtures should be stored under refrigeration whenever possible, and the potential for microbiological growth should be considered when assigning expiration periods.<sup>2160</sup>

### Ambulatory Pumps

Prepared in bacteriostatic sodium chloride 0.9% preserved with benzyl alcohol 0.9%, cladribine exhibits both chemical and physical stability for at least 7 days in Sims Deltec ambulatory infusion pump reservoirs.<sup>2938</sup> Preservative effectiveness may be reduced in solutions prepared for patients weighing more than 85 kg due to greater benzyl alcohol dilution in such patients.<sup>2938</sup> In solutions of cladribine at concentrations of 0.15 to 0.3 mg/mL in bacteriostatic sodium chloride 0.9% containing benzyl alcohol, the drug is stated to be stable for at least 14 days.<sup>1369</sup>

## Compatibility Information

## Clarithromycin

AHFS 8:12.12.92

### Products

Clarithromycin is available in 500-mg vials with lactobionic acid as a solubilizing agent and sodium hydroxide to adjust pH. Reconstitute with 10 mL of sterile water for injection, and shake to dissolve the powder. Do not use diluents containing preservatives or inorganic salts. Each mL of the resultant solution contains 50 mg of clarithromycin. This solution must be diluted before use. See Administration below.<sup>38 115</sup>

### Trade Name(s)

Klacid, Klaricid, Zeclar

### Administration

Clarithromycin is administered by intravenous infusion after dilution in an appropriate infusion solution. It should not be

given by intravenous bolus or intramuscular injection. The reconstituted drug solution (500 mg) is added to 250 mL of compatible infusion solution yielding a 2-mg/mL final solution. The final diluted solution is administered by intravenous infusion over 60 minutes into one of the larger proximal veins.<sup>38 115</sup>

### Stability

Intact containers of the white to off-white lyophilized powder should be stored at 30°C or below and protected from light. When reconstituted as directed, the 50-mg/mL solution should be used within 24 hours stored at room temperature of 25°C<sup>38 115</sup> and 48 hours stored under refrigeration at 5°C.<sup>115</sup>

## Clevidipine Butyrate

AHFS 24:28.08

### Products

Clevidipine is available as a ready-to-use oil-in-water emulsion in 50-, 100-, and 250-mL single-use vials.<sup>3200</sup> Each mL contains clevidipine butyrate 0.5 mg along with soybean oil 200 mg, glycerin 22.5 mg, purified egg yolk phospholipids 12 mg, oleic acid 0.3 mg, and disodium edetate 0.05 mg (0.005%) with sodium hydroxide to adjust the pH.<sup>3200 3236</sup>

### pH

From 6 to 8<sup>3200</sup> or 8.8.<sup>3236</sup>

### Trade Name(s)

Cleviprex

### Administration

Clevidipine butyrate is administered by intravenous infusion into either a central line or peripheral line using an infusion device that allows calibrated infusion rates.<sup>3200</sup>

Vials of clevidipine should be inverted gently several times prior to administration to ensure uniformity of the emulsion.<sup>3200</sup> Commercially available standard plastic cannulae may be used to administer the infusion.<sup>3200</sup>

Clevidipine ready-to-use emulsion should not be diluted.<sup>3200</sup>

### Stability

Clevidipine butyrate is a milky white, oil-in-water emulsion.<sup>3200</sup> Intact vials should be stored at 2 to 8°C in the carton to protect from light and should not be frozen.<sup>3200</sup> Intact vials may be

stored for up to 2 months at controlled room temperature; vials stored at room temperature should be marked with the date of removal from refrigeration and a "DISCARD BY" date of 2 months after transfer to room temperature storage or the expiration date, whichever comes first.<sup>3200</sup> Once moved to storage at room temperature, vials should not be returned to refrigerated storage.<sup>3200</sup>

The lipid base of the oil-in-water emulsion supports microbiological growth.<sup>3200</sup> The disodium edetate in the formulation retards the growth of microorganisms, but the product can still support growth and is not antimicrobially preserved.<sup>3200</sup> Aseptic technique should be maintained during handling.<sup>3200</sup>

Once the vial stopper is punctured, administration of clevidipine butyrate should be completed within 12 hours and any unused portion should be discarded.<sup>3200</sup> The emulsion should be visually inspected for particulate matter and discoloration prior to administration.<sup>3200</sup>

### Temperature Effects

Clevidipine should be stored at 2 to 8°C;<sup>3200</sup> however, clevidipine butyrate (Chiesi) 0.5 mg/mL in intact vials has been reported to be physically and chemically stable after 5 cycles of alternating storage at 5°C for 24 hours followed by 25°C for 24 hours.<sup>3334</sup>

### Freezing Solutions

Clevidipine should not be frozen;<sup>3200</sup> however, clevidipine butyrate (Chiesi) 0.5 mg/mL in intact vials has been reported to be physically and chemically stable for up to 12 hours at -15°C followed by storage for 24 hours at 5°C.<sup>3334</sup>

# Clindamycin Phosphate

AHFS 8:12.28.20

## Products

Clindamycin phosphate is available in 2-, 4-, and 6-mL single-dose and ADD-Vantage vials and a 60-mL pharmacy bulk package containing the equivalent of clindamycin base 150 mg/mL.<sup>3384</sup> Single-dose vials and the pharmacy bulk package are intended for intravenous or intramuscular use; ADD-Vantage vials are intended for intravenous use only.<sup>3384</sup> Each mL of solution also contains benzyl alcohol 9.45 mg and disodium edetate 0.5 mg.<sup>3384</sup> Sodium hydroxide and/or hydrochloric acid may have been added to adjust the pH.<sup>3384</sup> For intravenous administration, the injection solution should be diluted in a compatible diluent; clindamycin doses of 300 and 600 mg should be diluted in 50 mL, doses of 900 mg should be diluted in 50 to 100 mL, and doses of 1200 mg should be diluted in 100 mL.<sup>3384</sup> The injection solution should be used undiluted for intramuscular administration.<sup>3384</sup> ADD-Vantage vials of clindamycin should be prepared with 50 mL (for the 300- and 600-mg vials) or 100 mL (for the 900-mg vials) of dextrose 5% or sodium chloride 0.9% in ADD-Vantage diluent bags.<sup>3384</sup>

Clindamycin phosphate also is available in several ready-to-use formulations.<sup>3384 3385 3386 3387</sup> Clindamycin phosphate is available as a premixed injection solution containing the equivalent of 300, 600, and 900 mg of clindamycin base in 50 mL of dextrose 5% in single-dose Galaxy<sup>3384</sup> and Cryovac<sup>3387</sup> plastic containers and glass bottles<sup>3386</sup> and in 50 mL of sodium chloride 0.9% in single-dose Galaxy containers.<sup>3385</sup> Premixed injection solutions also contain disodium edetate 0.04 mg/mL.<sup>3384 3385 3386 3387</sup> Sodium hydroxide and/or hydrochloric acid have been added to adjust the pH.<sup>3384 3385 3386 3387</sup>

## pH

Clindamycin (Alvogen) 150-mg/mL injection solution has a pH ranging from 5.5 to 7.<sup>3388</sup>

Clindamycin (Akorn) 6-, 12-, and 18-mg/mL premixed infusion solutions in dextrose 5% have a pH ranging from 5.9 to 6.3.<sup>3390</sup>

Clindamycin (Baxter) 6-, 12-, and 18-mg/mL premixed infusion solutions in sodium chloride 0.9% have a pH ranging from 5.5 to 6.5.<sup>3389</sup>

## Osmolality

Clindamycin (Upjohn) 150 mg/mL has been reported to have an osmolality of 795 mOsm/kg<sup>50</sup> or 835 mOsm/kg<sup>1071</sup> as determined by freezing-point depression. However, the manufacturer has stated that the osmolality is usually 825 to 880 mOsm/kg.<sup>1705</sup>

The osmolality of clindamycin (Upjohn) 12 mg/mL was determined to be 293 mOsm/kg in dextrose 5% and 309 mOsm/kg in sodium chloride 0.9%.<sup>1375</sup>

One manufacturer has stated that the osmolalities of clindamycin (Akorn) 300-, 600-, and 900-mg premixed infusion

solutions in dextrose 5% are 260 to 340, 280 to 370, and 300 to 400 mOsm/kg, respectively.<sup>3390</sup> One manufacturer has stated that the osmolalities of clindamycin (Baxter) 300-, 600-, and 900-mg premixed infusions in sodium chloride 0.9% are 285 to 345, 305 to 370, and 335 to 395 mOsm/kg, respectively.<sup>3389</sup>

The osmolality of clindamycin 600 mg was calculated for the following dilutions:<sup>1054</sup>

Diluent	Osmolality (mOsm/kg)	
	50 mL	100 mL
Dextrose 5%	279	268
Sodium chloride 0.9%	306	294

## Trade Name(s)

Cleocin Phosphate

## Administration

Clindamycin phosphate is administered by intermittent intravenous infusion at concentrations not exceeding 18 mg/mL of clindamycin.<sup>3384 3384 3385 3386 3387</sup> Intermittent infusions should be administered over 10 to 60 minutes at a rate not exceeding 30 mg/min; clindamycin doses of 300, 600, 900, and 1200 mg should be infused over 10, 20, 30, and 40 minutes, respectively.<sup>3384 3385 3386</sup> Not more than 1200 mg of clindamycin should be administered in a single 1-hour infusion period.<sup>3384 3386</sup> Alternatively, following an initial single rapid infusion over 30 minutes with an infusion rate ranging from 10 to 20 mg/min, the drug also can be administered by continuous intravenous infusion at maintenance infusion rates of 0.75 to 1.25 mg/min in adult patients, with infusion rates determined by the desired serum clindamycin concentration.<sup>3384 3385 3386</sup> The drug should not be administered undiluted as a bolus.<sup>3384</sup>

Clindamycin phosphate also can be administered by intramuscular injection as an undiluted solution in some patients.<sup>3384</sup> Single injections exceeding 600 mg are not recommended.<sup>3384</sup>

## Stability

Intact containers of clindamycin phosphate should be stored at controlled room temperature; exposure to heat should be minimized and temperatures above 30°C should be avoided.<sup>3384 3385 3386 3387</sup> Some manufacturers state that vials should not be refrigerated.<sup>3388</sup> Crystallization may occur if refrigerated; the crystals resolubilize when warmed to room temperature, but care should be exercised to ensure that all crystals have redissolved.<sup>102</sup> Solutions should be visually inspected for particulate matter and discoloration prior to administration; only clear solutions should be used.<sup>3384 3385 3386 3387 3388</sup>

Less than 10% decomposition occurs in 2 years at 25°C at pH 3.5 to 6.5.<sup>102 103</sup>

## pH Effects

Maximum stability occurs at pH 4, but an acceptable long-term shelf life is attained at pH 1 to 6.5.<sup>1072</sup>

## Freezing Solutions

Manufacturers state that clindamycin 6, 9, and 12 mg/mL in dextrose 5%, sodium chloride 0.9%, or Ringer's injection, lactated is physically compatible and chemically stable for 56 days at  $-10^{\circ}\text{C}$ .<sup>3384 3388</sup> Frozen solutions should be thawed at room temperature and should not be refrozen.<sup>3384 3388</sup>

Some manufacturers state that vials of clindamycin phosphate should not be refrigerated.<sup>3384 3388</sup> Crystallization may occur if refrigerated; the crystals resolubilize when warmed to room temperature, but care should be exercised to ensure that all crystals have redissolved. This would also apply if the product is frozen.<sup>102</sup>

## Syringes

Clindamycin 900 mg/6 mL in polypropylene syringes (Becton Dickinson) retained more than 95% of the initial concentration over at least 48 hours at room temperature.<sup>172</sup> Diluted with sterile water for injection to concentrations of 20, 40, 60, and 120 mg/mL and stored in Monoject plastic syringes or glass vials, clindamycin exhibited little change in concentration and was free of particulate matter over 30 days at  $25^{\circ}\text{C}$  and 60 days at  $-15^{\circ}\text{C}$ .<sup>173</sup>

Clindamycin (Upjohn) 900 mg/6 mL showed no more than a 4 to 5% loss when stored in polypropylene syringes (Becton Dickinson) for 48 hours at  $25^{\circ}\text{C}$  under fluorescent light.<sup>1159</sup>

Clindamycin (Upjohn) 600 mg stored in polypropylene syringes (3M) at  $25^{\circ}\text{C}$  under fluorescent light exhibited no loss in 48 hours.<sup>1164</sup>

## Vials

Dilution of clindamycin 300 and 900 mg in glass vials containing 20 mL of dextrose 10% resulted in no visual changes and less than a 10% loss after 30 days of refrigeration at  $10^{\circ}\text{C}$ .<sup>1604</sup>

Clindamycin (Abbott) injection was diluted with sterile water for injection to a concentration of 15 mg/mL for use in minimizing measurement errors in pediatric dosing. The dilution was packaged in glass vials, and samples were stored at 22 and  $4^{\circ}\text{C}$ . The dilution remained visually free of particulate matter at both storage conditions throughout the study. No clindamycin loss occurred after 91 days at either 4 or  $22^{\circ}\text{C}$ .<sup>1714</sup>

Clindamycin phosphate is incompatible with natural rubber closures because of the extraction of crystalline particulate matter, primarily  $\beta$ -sitosterol and stigmasterol. Simple cleaning procedures for the closures do not effectively remove the source of contamination. It is recommended that if clindamycin phosphate is repackaged in vials or disposable syringes, storage at room temperature should be limited to a few days.<sup>102</sup>

## Central Venous Catheter

Clindamycin (Upjohn) 2 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

## Compatibility Information

<sup>n</sup> Piperacillin component. Piperacillin in an 8:1 fixed-ratio concentration with tazobactam.

<sup>o</sup> Run at 25 mL/hr with dextrose 5% run at 83 mL/hr.

<sup>p</sup> Run at 100 mL/hr.

<sup>q</sup> Test performed using the formulation WITH edetate disodium.

## Additional Compatibility Information

### *Infusion Solutions*

Manufacturers state that clindamycin phosphate demonstrated no inactivation or incompatibility in intravenous solutions containing sodium chloride, dextrose, and calcium or potassium and in solutions containing vitamin B complex in concentrations used clinically.<sup>3384 3388</sup>

### *Other Drugs*

Manufacturers state that clindamycin phosphate is physically incompatible with aminophylline, ampicillin sodium, barbiturates,

calcium gluconate, magnesium sulfate, and phenytoin sodium, but that no incompatibility has been demonstrated with cephalothin, kanamycin, gentamicin, penicillin, and carbenicillin.<sup>3384 3388</sup>

### *Peritoneal Dialysis Solutions*

Clindamycin (Upjohn) 10 mg/L stability in peritoneal dialysis solutions (Dianeal 137 and PD-2) with heparin sodium 500 units/L was evaluated. Approximately 102 ± 9% activity remained after 24 hours at 25°C.<sup>1228</sup>

Clindamycin (Dalacin C Phosphate, Pfizer) 300 mg in 2 L of Dianeal PD-4 with dextrose 2.5% (Baxter) exhibited little to no loss of drug over 6 hours at 37°C.<sup>3108</sup>

# Clofarabine

AHFS 10:00

## Products

Clofarabine is available as a 1-mg/mL solution in 20-mL single-use (preservative-free) vials.<sup>3213</sup> Each vial also contains water for injection and sodium chloride.<sup>3213</sup>

To prepare for administration, clofarabine injection should be passed through a 0.2- $\mu$ m syringe filter and then diluted in an appropriate amount of dextrose 5% or sodium chloride 0.9% to yield a final clofarabine concentration between 0.15 and 0.4 mg/mL.<sup>3213</sup>

## pH

The pH of the undiluted solution ranges from 4.5 to 7.5.<sup>3213</sup>

## Osmolarity

The osmolarity of the undiluted solution (Evoltra) is from 270 to 310 mOsm/L.<sup>3215</sup>

## Trade Name(s)

Clolar, Evoltra

## Administration

Clofarabine is administered as an intravenous infusion over 2 hours following dilution of the drug with dextrose 5% or sodium chloride 0.9%.<sup>3213</sup>

As with other toxic drugs, applicable special handling and disposal procedures for clofarabine should be followed.<sup>3213</sup>

## Stability

Clofarabine injection is a clear, practically colorless solution.<sup>3213</sup> Intact vials should be stored at controlled room temperature.<sup>3213</sup>

Diluted solutions of clofarabine should be stored at room temperature (15 to 30°C) and must be used within 24 hours of preparation.<sup>3213</sup>

The undiluted 1-mg/mL solution of clofarabine in the original glass vial was found to be physically and chemically stable for 4 weeks after first opening the vial at 2 to 8°C or 25°C both with and without light protection.<sup>3216</sup>

## Filtration

Clofarabine injection should be filtered through a 0.2- $\mu$ m syringe filter prior to dilution.<sup>3213</sup>

# Clonazepam

**AHFS 28:12.08**

## Products

Clonazepam is available as a concentrate for injection in 1-mL ampuls containing 1 mg of the drug in a solvent composed of ethanol, benzyl alcohol, propylene glycol, and glacial acetic acid.<sup>3406 3407</sup> Each ampul of the drug is packaged with an ampul containing 1 mL of sterile water for injection diluent.<sup>3406 3407</sup>

For intravenous injection, the contents of the clonazepam ampul must be mixed thoroughly with the contents of the diluent ampul of sterile water for injection; to avoid local irritation of the veins, the mixture should be prepared immediately prior to administration.<sup>3406 3407</sup>

For intravenous infusion, the contents of each clonazepam ampul (1 mg) should be diluted to at least 85 mL (e.g., 3 mg of clonazepam in 250 mL) with sodium chloride 0.9%, dextrose 2.5% in sodium chloride 0.45%, dextrose 5%, or dextrose 10% to avoid precipitation.<sup>3406 3407</sup>

## pH

Clonazepam (Roche) 0.125, 0.222, and 0.5 mg/mL in sodium chloride 0.9% for continuous subcutaneous infusion had pH values of 3.6, 3.5, and 3.6, respectively.<sup>2161</sup>

## Trade Name(s)

Rivotril

## Administration

Clonazepam is administered after dilution by slow intravenous injection or intravenous infusion.<sup>3406 3407</sup> When administered by intravenous injection, the diluted drug must be administered very slowly into a sufficiently large vein at a rate not exceeding 0.25 to 0.5 mg/min.<sup>3406 3407</sup> If the injection is administered rapidly or the vein into which the diluted drug is administered is not sufficiently large, there is a risk of thrombophlebitis and subsequent thrombosis.<sup>3406 3407</sup>

Clonazepam has been administered intramuscularly after being mixed thoroughly with the contents of the diluent ampul of sterile water for injection, but this route should be used only in exceptional cases or if intravenous administration is not possible.<sup>3407</sup> Efficacy of clonazepam administered by the intramuscular route has not been demonstrated.<sup>3406</sup>

## Stability

Clonazepam concentrate for injection is a colorless to slightly green-yellow solution.<sup>3406 3407</sup> Intact ampuls should be stored below 25<sup>3406</sup> or 30°C<sup>3407</sup> in the outer carton to protect from light.<sup>3406 3407</sup> If intended for administration by slow intravenous injection, the manufacturer recommends that the drug be used immediately after mixing with the supplied sterile water for injection diluent.<sup>3406 3407</sup> After clonazepam is diluted in a compatible infusion solution as instructed, the infusion is stated

to be stable for 24 hours at room temperature;<sup>3406 3407</sup> however, if prepared in a polyvinyl chloride (PVC) container, the infusion should be infused immediately and usually within 4 hours, and the infusion time should not exceed 8 hours.<sup>3407</sup>

Clonazepam should not be mixed with sodium bicarbonate because of the potential for precipitation.<sup>3406 3407</sup>

## Syringes

Clonazepam (Roche) 5 and 10 mg, diluted to 48 mL with sodium chloride 0.9% and stored in polyethylene syringes, was physically compatible and exhibited no clonazepam loss in 10 hours at room temperature.<sup>1708</sup>

Reconstituted clonazepam (Roche) 0.5 mg/mL packaged in polypropylene syringes was evaluated. Less than 2% clonazepam loss occurred in 48 hours stored at room temperature exposed to normal room light.<sup>2172</sup>

## Sorption

Clonazepam can adsorb to plastic infusion bags and infusion sets, especially those made of PVC.<sup>3406 3407</sup> Clonazepam has demonstrated sorption losses of up to 50% when in contact with PVC, especially when prepared bags are stored for more than 24 hours and/or when bags are stored in warm ambient conditions or when long tubing sets or slow rates of infusion are used.<sup>3406 3407</sup> It is recommended that PVC-containing bags and infusion sets be avoided if possible and that alternative materials be used.<sup>3406 3407</sup> If PVC bags are used, the admixture should be infused immediately and usually within 4 hours, and the infusion time should not exceed 8 hours.<sup>3407</sup> Caution should be exercised when switching between PVC and non-PVC-containing bags and infusion sets.<sup>3406 3407</sup>

Hooymans et al. compared losses of clonazepam to PVC and polyethylene-lined infusion tubing. Clonazepam (Roche) 5 and 10 mg, diluted in sodium chloride 0.9% to a final volume of 48 mL in polyethylene syringes, was delivered at room temperature through tubing at flow rates of 2 or 4 mL/hr (5 mg in 48 mL) and 2 mL/hr (10 mg in 48 mL). No losses were observed in the plastic syringes or to the polyethylene-lined tubing over 10 hours. Losses to the PVC tubing were dependent on the flow rate and concentration, being greater at 2 mL/hr and at 5 mg/48 mL, respectively. Potency decreased to approximately 40 and 55% of the original strength after 0.6 hour for the 5-mg/48 mL concentration at 2 and 4 mL/hr, respectively. After 0.6 hour, the 10-mg/48 mL concentration retained 55% of original potency when delivered at 2 mL/hr. Effluent concentrations gradually increased after the first hour, reaching approximately 80 to 90% of original concentrations after 10 hours.<sup>1708</sup>

Clonazepam (Roche) (concentration unspecified) in dextrose 5% in PVC containers was delivered over 4 hours through PVC administration sets. Losses due to sorption ranged from about 13 to 18% determined by UV spectroscopy.<sup>2045</sup>

## Clonidine Hydrochloride

AHFS 24:08.16

### Products

Clonidine hydrochloride is available in concentrations of 0.1 mg/mL (100 mcg/mL) and 0.5 mg/mL (500 mcg/mL) in 10-mL vials. Each mL of the preservative-free solution also contains sodium chloride 9 mg in water for injection. Hydrochloric acid and/or sodium hydroxide may have been added to adjust the pH.<sup>1(2/06)</sup>

### pH

From 5 to 7.<sup>1(2/06)</sup>

### Trade Name(s)

Duraclon

### Administration

Clonidine hydrochloride injection is administered by continuous epidural infusion using an appropriate epidural infusion device. The 0.5-mg/mL concentration must be diluted with sodium chloride 0.9% to 0.1 mg/mL for use. Clonidine hydrochloride injection must not be used with a preservative.<sup>1(2/06)</sup>

### Stability

Intact vials containing the clear, colorless solution should be stored at controlled room temperature.<sup>1(2/06)</sup> They are stable for 6 months stored at an elevated temperature of 40°C, remaining clear and colorless with no loss of clonidine hydrochloride.<sup>2069</sup>

Clonidine hydrochloride (Roxane) 100 mcg/mL was filled into plastic syringes (Becton Dickinson), pump reservoirs (Bard), and glass vials and stored at 22 to 27°C for 7 days. The solution was also filled into administration set tubing (Kendall McGaw) and stored under the same conditions. In all cases, the solution remained clear and colorless and no loss of potency was found.<sup>2069</sup>

Clonidine hydrochloride 100 mcg/mL was delivered at a rate of 0.1 mL/hr for 7 days through 2 epidural catheter sets, Epi-Cath (Abbott) and Port-A-Cath (Pharmacia Deltec). The temperature was maintained at 37°C to simulate internal use of the set. The delivered solution remained clear and colorless throughout the study. Furthermore, the solution delivered through the Epi-Cath resulted in little or no loss. With the Port-A-Cath, a concentrating effect due to a loss of water was countered by a small clonidine hydrochloride loss of drug (about 5%). The net effect was delivery of about 95% of the clonidine hydrochloride dose.<sup>2069</sup>

## Compatibility Information

### Solution Compatibility

#### Clonidine HCl

Test Soln Name	Mfr	Mfr	Conc/L or %	Remarks	Ref	C/I
Dextrose 5%	BA <sup>a</sup>	MDZ	0.5 and 5 mg	Physically stable with little to no loss of drug in 7 days at 4°C	3506	C
Dextrose 10%	BA <sup>a</sup>	MDZ	0.5 and 5 mg	Physically stable with little to no loss of drug in 7 days at 4°C	3506	C

### Syringes

Clonidine hydrochloride (Boehringer Ingelheim) 9 mcg/mL in sodium chloride 0.9% was packaged in 2 types of polypropylene syringes. The Omnifix (B. Braun) syringes had polyisoprene piston tips while the Terumo syringes had no natural or synthetic rubber in the product. Stored at 4, 21, and 35°C for 30 days, the test solutions in Terumo syringes exhibited no visual changes or changes in measured pH. Stored at 4, 21, and 35°C for 30 days, the test solutions in Omnifix syringes exhibited no visual changes but substantial changes in measured pH occurred in some samples. An acceptable pH was maintained for 30 days at 4°C, 5 days at 21°C, and less than 1 day at 35°C. Although the pH remained within the stability range for the drug in most of the samples, this does not definitively demonstrate stability.<sup>2387</sup>

Clonidine hydrochloride (Medicianz) 0.5 and 5 mcg/mL in dextrose 5%, dextrose 10%, and sodium chloride 0.9% was packaged in 20-mL plastic syringes (MicroAnalytix).<sup>3506</sup> Solutions were physically stable with little to no loss of drug in 24 hours at 35°C.<sup>3506</sup>

### Implantable Pumps

An admixture of bupivacaine hydrochloride 25 mg/mL, clonidine hydrochloride 2 mg/mL, and morphine sulfate 50 mg/mL in sterile water for injection was reported to be physically and chemically stable for 90 days at 37°C in SynchroMed implantable pumps. Little or no loss of any drug occurred.<sup>2585</sup>

Clonidine hydrochloride and morphine sulfate powders were dissolved in ziconotide acetate (Elan) injection to yield concentrations of 2 and 35 mg/mL and 25 mcg/mL, respectively. Stored at 37°C, 11% ziconotide loss in 7 days, 4% clonidine loss in 20 days, and no morphine loss in 28 days occurred.<sup>2752</sup>

Morphine sulfate (Infumorph) 20 mg/mL with clonidine hydrochloride (Boehringer Ingelheim) 50 mcg/mL and morphine sulfate 2 mg/mL with clonidine hydrochloride 1.84 mg/mL were evaluated in SynchroMed EL (Medtronic) implantable pumps with silicone elastomer intrathecal catheters at 37°C for 3 months. No visible incompatibilities were observed, and delivered concentrations of both drugs were in the range of 94 to 99.6% of the theoretical concentrations throughout the study. Furthermore, no impairment of mechanical performance of the pump or any of its components was found.<sup>2477</sup>

## Cloxacillin Sodium

AHFS 8:12.16.12

### Products

Cloxacillin sodium is available as a dry powder in vials containing 500 mg, 1 g, and 2 g of cloxacillin as the sodium salt.<sup>3248</sup> The drug also is available in a pharmacy bulk package containing 10 g of cloxacillin as the sodium salt.<sup>3248</sup>

For intramuscular use, 1.7 mL of sterile water for injection should be added to the 500-mg vial, and the vial should be shaken well to yield a solution with a nominal concentration of 250 mg/mL.<sup>3248</sup>

For intravenous use, 4.8 or 9.6 mL of sterile water for injection should be added to a 500-mg or 1-g vial, respectively, and the vial should be shaken well to yield a solution with a nominal concentration of 100 mg/mL.<sup>3248</sup>

For intravenous infusion, 3.4 or 6.8 mL of sterile water for injection should be added to the 1- or 2-g vial, respectively, and the vial should be shaken well to yield a solution with a nominal concentration of 250 mg/mL, which is then added to an appropriate infusion solution for administration.<sup>3248</sup> The 10-g pharmacy bulk package should be reconstituted with 34 mL of sterile water for injection and shaken well to yield a solution with a nominal concentration of 250 mg/mL, which is then added to an appropriate infusion solution for administration.<sup>3248</sup>

### Sodium Content

Each gram of cloxacillin sodium contains approximately 50 mg of sodium.<sup>3248</sup>

### Administration

Cloxacillin sodium may be administered by intramuscular injection, direct intravenous injection slowly over 2 to 4 minutes, or by intravenous infusion (following dilution in an appropriate infusion solution) over 30 to 40 minutes.<sup>3248</sup>

### Stability

Intact vials containing the drug in dry form should be stored at controlled room temperature.<sup>3248</sup> After reconstitution with sterile water for injection, cloxacillin solutions are stable for up to 24 hours at controlled room temperature not exceeding 25°C or 48 hours under refrigeration at 2 to 8°C.<sup>3248</sup>

Cloxacillin sodium (Beecham) 250 mg reconstituted with 1.5 mL and 500 mg reconstituted with 2 mL of sterile water for injection exhibited a 5% loss in 7 days at 5°C and a 15% loss in 4 days at 23°C.<sup>99</sup>

Cloxacillin sodium (Ayerst) 20 g/L in sodium chloride 0.9% or dextrose 5% was stored in polyvinyl chloride (PVC) minibags (Travenol) or glass bottles (Travenol) for 24 hours at 5 and 22°C. No significant decrease in antibiotic stability was observed at 24 hours in sodium chloride 0.9% in either container. With dextrose 5%, a decrease in cloxacillin was observed at 24 hours. The results indicated that cloxacillin sodium was stable for 24 hours in sodium chloride 0.9% and for 8 hours in dextrose 5%.<sup>298</sup>

### pH Effects

Cloxacillin sodium is most stable at a pH of 5.5 to 7, with a minimum decomposition rate at pH 6.3.<sup>1476 1477</sup>

### Freezing Solutions

Cloxacillin sodium (Beecham) at concentrations of 1 to 10%, buffered to pH 6.05, lost no more than 1% potency in 1 month when frozen at -20°C.<sup>99</sup>

Cloxacillin sodium (Beecham) 1 g in 50 mL of dextrose 5% or sodium chloride 0.9% in PVC containers (Travenol) was frozen at -20°C for 30 days, followed by natural thawing and storage at 5°C for 21 hours. The cloxacillin concentration was retained for the duration of the study.<sup>299</sup>

Cloxacillin sodium 2 g in 100 mL in dextrose 5% or sodium chloride 0.9% in PVC containers was frozen at -27°C for up to 9 months and then thawed by microwave. The results indicated that at least 90% of the concentration was retained. A distinct yellow discoloration was observed in solutions in dextrose 5% stored for 6 months. Consequently, the authors recommended that such frozen solutions not be stored for more than 3 months.<sup>1176</sup>

Cloxacillin sodium (Beecham) 500 mg in 50-mL PVC bags (Travenol) stored at -20°C and thawed under natural conditions was stable for at least 100 days. In addition, the drug was stable under refrigeration for 4 days followed by 24 hours at room temperature after thawing.<sup>1478</sup>

### Sorption

Cloxacillin sodium was shown not to exhibit sorption to PVC bags and tubing, polyethylene tubing, Silastic tubing, and polypropylene syringes.<sup>536 606</sup>

### Filtration

Cloxacillin sodium (Beecham) 1.97 mg/mL in sodium chloride 0.9% or dextrose 5% was filtered through a 0.22- $\mu$ m cellulose acetate membrane filter (Ivex-HP, Millipore) over 6 hours. No significant loss due to binding was noted.<sup>1034</sup>

## Colistimethate Sodium

AHFS 8:12.28.28

### Products

Colistimethate sodium is a prodrug that undergoes hydrolysis in vivo to form primarily the active drug, colistin, which is a mixture of the 2 active components colistin A (polymyxin E1) and colistin B (polymyxin E2).<sup>2734 3152 3153 3154</sup> Colistimethate sodium is available as a lyophilized cake of a complex mixture, containing colistimethate sodium or pentasodium colistinmethanesulfonate, in vials containing the equivalent of 150 mg of colistin base activity.<sup>3150 3151 3154</sup>

Each 150-mg vial should be reconstituted with 2 mL of sterile water for injection to yield a solution containing 75 mg/mL of colistin base activity.<sup>3150 3151</sup> During reconstitution, the contents of the vials should be gently swirled to avoid frothing.<sup>3150 3151</sup> Reconstituted solutions should be visually inspected for particulate matter and discoloration prior to administration; if particulate matter is present or discoloration occurs, the solution should not be used.<sup>3150 3151</sup>

### Units

The strength of colistimethate for injection products is expressed in terms of equivalent colistin base activity, *not* in terms of the prodrug.<sup>3150 3151 3153</sup> In the US, it has been recommended that all prescribing of the drug consistently be in terms of colistin base activity to avoid dosing errors that could result from confusion between the 2 forms.<sup>3153</sup> The manufacturers provide dosage recommendations in terms of colistin base activity.<sup>3150 3151 3153</sup> If the drug is ordered as colistimethate or colistimethate sodium, the dosage should be clarified in terms of colistin base activity.<sup>3153</sup>

### Sodium Content

Colistimethate sodium (Perrigo) contains approximately 0.099 mg (0.0043 mEq) of sodium per mg of colistin.<sup>3151</sup>

### Trade Name(s)

Coly-Mycin M Parenteral

### Administration

Colistimethate sodium may be administered intravenously or intramuscularly.<sup>3150 3151</sup>

For intravenous administration, half of the total daily dose should be administered as an intermittent direct intravenous injection over 3 to 5 minutes every 12 hours.<sup>3150 3151</sup> Alternatively, half of the total daily dose should be administered as a direct intravenous injection over 3 to 5 minutes and the remaining half of the total daily dose should be diluted in a compatible infusion solution and administered by slow intravenous infusion over 22 to 23 hours beginning 1 to 2 hours after administration of the direct intravenous injection.<sup>3150 3151</sup> Slower rates of infusion may be warranted in specific populations (e.g., those with renal impairment).<sup>3150 3151</sup>

The reconstituted solution also may be administered by deep intramuscular injection into a large muscle mass (e.g., gluteal muscles, lateral part of the thigh).<sup>3150 3151</sup>

### Stability

Colistimethate sodium is a white to slightly yellow lyophilized cake.<sup>3150 3151</sup> Intact vials should be stored at controlled room temperature.<sup>3150 3151</sup>

In addition to undergoing hydrolysis in vivo, colistimethate sodium also may undergo spontaneous hydrolysis to colistin in aqueous solution prior to administration.<sup>2734 3152 3154</sup> In 2007, FDA warned healthcare professionals that prolonged storage (longer than 24 hours) of the reconstituted drug resulted in increased concentrations of colistin in solution.<sup>2734</sup> The FDA warning followed the death of a cystic fibrosis patient who received the injectable colistimethate sodium product prepared in advance and administered by inhalation via nebulization; the drug is not FDA-labeled for such use.<sup>2734 3150 3151</sup> It was not known how far in advance of administration the drug was prepared or whether it was prepared with saline or water;<sup>3154</sup> however, some studies have indicated that hydrolysis of colistimethate sodium to colistin is both temperature and concentration dependent<sup>3152</sup> and that the drug is substantially less stable when diluted in saline.<sup>3154</sup> The FDA recommends that colistimethate sodium be administered promptly after mixing.<sup>2734</sup>

The manufacturers state that the reconstituted solution may be stored at 2 to 8°C or between 20 and 25°C and used within 7 days.<sup>3150 3151</sup> Solutions diluted for intravenous infusion should be used after preparation or within 24 hours.<sup>3150 3151</sup>

One study found that the reconstituted solution of 75 mg/mL of colistin base activity (APP) prepared with sterile water for injection and stored at -70, -20, 4, and 21°C for 24 hours exhibited formation of less than 1% colistin A and B combined.<sup>3154 3231</sup> A single freeze-thaw cycle did not appear to substantially affect hydrolysis.<sup>3154</sup>

In another study, less than 0.1% of the initial colistimethate sodium concentration was present as colistin after storage of the reconstituted solution of 75 mg/mL of colistin base activity (Pfizer) prepared with sterile water for injection at 4 or 25°C for 7 days in the dark.<sup>3155</sup>

Diluted solutions of 0.333 mg/mL of colistin base activity (Foster) were prepared using sodium chloride 0.9% and stored at 4°C in an elastomeric pump (Braun Easypump).<sup>3152</sup> Degradation of colistimethate sodium to colistin was not detected within the first 3 days of storage at 4°C; however, after 7 days of storage at 4°C and a subsequent 24 hours of storage at 20 to 25°C, the drug was rapidly hydrolyzed to colistin (more than 30%).<sup>3152</sup>

In a diluted solution of 1.5 mg/mL of colistin base activity (Pfizer) prepared using sodium chloride 0.9% or dextrose 5% and stored at 4 or 25°C for 48 hours in the dark, colistin formation was 0.3% of the initial colistimethate sodium concentration at 4°C and 4% at 25°C in both diluents.<sup>3155</sup>

**Filtration**

Colistimethate sodium (R. Bellon) 0.16 mg/mL in dextrose 5% and sodium chloride 0.9% was filtered through a 0.22- $\mu$ m cellu-

lose ester member filter (Ivex-HP, Millipore) over 6 hours. No significant drug loss due to binding to the filter was noted.<sup>1034</sup>

# Conivaptan Hydrochloride

AHFS 40:28.28

## Products

Conivaptan hydrochloride is available as a single-use ready-to-use solution of 20 mg conivaptan hydrochloride in 100 mL dextrose 5% in a flexible plastic container.<sup>2838</sup> The solution also contains lactic acid for pH adjustment.<sup>2838</sup>

### pH

The pH is adjusted to the range of 3.4 to 3.8.<sup>2838</sup>

### Osmolality

The osmolality of conivaptan hydrochloride ready-to-use solution is within the range of 250 to 330 mOsm/kg.<sup>2839</sup>

### Trade Name(s)

Vaprisol

## Administration

Conivaptan hydrochloride in dextrose ready-to-use solution is administered only by intravenous infusion.<sup>2838</sup> No further dilution is required.<sup>2838</sup> A loading dose of conivaptan hydrochloride

is administered over 30 minutes, followed by a continuous infusion.<sup>2838</sup> The drug should be administered through large veins with the infusion site changed every 24 hours to minimize the risk of vascular irritation.<sup>2838</sup>

## Stability

Conivaptan hydrochloride ready-to-use solution should be stored at 25°C and protected from light, freezing, and excessive heat; however, brief exposure to temperatures up to 40°C was not noted to adversely affect the product.<sup>2838</sup> The plastic container should remain in its overwrap until ready for use.<sup>2838</sup>

Little to no change in stability of the ready-to-use product was noted when stored in its foil overwrap for up to 6 months at 40°C and 20% relative humidity.<sup>2839</sup> Out of its overwrap, the product was stable at 25°C and 40% relative humidity for up to 31 days.<sup>2839</sup> Storage of the product at 5°C resulted in long-term stability of up to 38 months.<sup>2839</sup>

Following administration, any remaining product should be discarded.<sup>2838</sup>

## Cyanocobalamin

AHFS 88:08

### Products

Cyanocobalamin is available in a concentration of 1 mg/mL with sodium chloride 0.9%, benzyl alcohol 1.5%, and sodium hydroxide and/or hydrochloric acid to adjust pH during manufacturing.<sup>1(6/05) 4</sup>

### pH

From 4.5 to 7.<sup>1(6/05)</sup>

### Administration

Cyanocobalamin is administered by intramuscular or deep subcutaneous injection. The intravenous route is not recommended because the drug is excreted more rapidly and almost all of the cyanocobalamin is lost in the urine.<sup>1(6/05) 4</sup>

### Stability

The clear pink to red solutions are stable at room temperature and may be autoclaved at 121°C for short periods such as 15 to 20 minutes. Cyanocobalamin is light sensitive, so protection from light is recommended.<sup>1(6/05) 4</sup> Exposure to light results in the

organometallic bond being cleaved, with the extent of degradation generally increasing with increasing light intensity.<sup>1072</sup>

The vitamins in Cernevit (Baxter) diluted in three 2-in-1 parenteral nutrition admixtures were tested for stability over 48 hours. Most of the vitamins, including cyanocobalamin, retained their initial concentrations.<sup>2796</sup>

### pH Effects

Cyanocobalamin is stable at pH 3 to 7 but is most stable at pH 4.5 to 5.<sup>1072</sup> It is stated to be incompatible with alkaline and strongly acidic solutions.<sup>4</sup>

### Sorption

Cyanocobalamin (Organon) 30 mg/L did not display significant sorption to a PVC plastic test strip in 24 hours.<sup>12</sup>

### Filtration

Cyanocobalamin (Wyeth) 1 mg/L in dextrose 5% and in sodium chloride 0.9% was filtered at a rate of 120 mL/hr for 6 hours through a 0.22- $\mu$ m cellulose ester membrane filter (Ivex-2). No significant reduction in potency due to binding to the filter was noted.<sup>533</sup>

## Cyclizine Lactate

AHFS 56:22.08

### Products

Cyclizine lactate is available in 1-mL ampuls containing 50 mg of drug in water for injection.<sup>38 115</sup>

### pH

From 3.3 to 3.7.<sup>176</sup>

### Trade Name(s)

Valoid

### Administration

Cyclizine lactate is administered by intramuscular or intravenous injection. When administered intravenously, it should

be injected slowly, with minimal withdrawal of blood in the syringe.<sup>38 115</sup>

### Stability

Cyclizine lactate injection, a colorless solution, should be stored below 25°C and protected from light.<sup>38 115</sup>

### Crystallization

Cyclizine lactate has an aqueous solubility of 8 mg/mL. When the drug was diluted to concentrations of 7.5 and 3.75 mg/mL in water or dextrose 5%, it remained in solution for at least 24 hours at 23°C. However, when these dilutions were made with sodium chloride 0.9%, crystals formed within 24 hours at 23°C.<sup>1761</sup>

# Cyclophosphamide

## AHFS 10:00

### Products

Cyclophosphamide is available as a dry powder in vials containing cyclophosphamide monohydrate equivalent to 500 mg, 1 g, or 2 g of cyclophosphamide.<sup>2962</sup> Reconstitute each vial with 25, 50, or 100 mL, respectively, of sodium chloride 0.9%.<sup>2962</sup> Sterile water for injection also may be used for reconstitution, but *only* if the dose is to be administered by intravenous infusion, in which case the reconstituted solution must be further diluted with a compatible intravenous infusion solution.<sup>2962</sup> Gently swirl the vials to dissolve the powder, yielding a solution containing cyclophosphamide 20 mg/mL.<sup>2962</sup>

### pH

A 22-mg/mL solution was found to have a pH of 6.87.<sup>126</sup>

### Administration

Cyclophosphamide reconstituted with sodium chloride 0.9% may be administered by direct intravenous injection or by intravenous infusion.<sup>2962</sup>

Cyclophosphamide reconstituted with sterile water for injection is very hypotonic and is *not* suitable for direct intravenous injection.<sup>2962</sup>

For intravenous infusion, the reconstituted solution must be further diluted in a compatible intravenous infusion solution.<sup>2962</sup>

### Stability

Vials containing cyclophosphamide powder should be stored at or below 25°C.<sup>2962</sup> Vials contain no preservatives and are for single use.<sup>2962</sup>

Do not use vials that show signs of cyclophosphamide melting (e.g., clear or yellowish viscous liquid as a connected phase or in droplets).<sup>2962</sup>

Visually inspect the solution for particulate matter and discoloration prior to administration.<sup>2962</sup> If not used immediately, solutions formed by reconstituting the dry powder with sodium chloride 0.9% may be stored for up to 24 hours at room temperature or up to 6 days under refrigeration.<sup>2962</sup> Solutions formed by reconstituting the dry powder with sterile water for injection should be further diluted for intravenous infusion immediately; do not store.<sup>2962</sup>

Total time (from reconstitution through administration) for solutions that are further diluted with dextrose 5% or dextrose 5% in sodium chloride 0.9% should not exceed 24 hours if stored at room temperature or 36 hours if stored under refrigeration; total time for solutions further diluted with sodium chloride 0.45% should not exceed 24 hours at room temperature or 6 days under refrigeration.<sup>2962</sup>

When reconstituted with sterile water for injection or paraben-preserved bacteriostatic water for injection to a concentration of 21 mg/mL, less than 1.5% cyclophosphamide decom-

position occurred within 8 hours at 24 to 27°C and within 6 days at 5°C. The rate constant for decomposition of cyclophosphamide when reconstituted with benzyl alcohol-preserved bacteriostatic water for injection was significantly higher than with sterile water for injection. It was suggested that benzyl alcohol may catalyze the decomposition of cyclophosphamide.<sup>125</sup>

The stability of cyclophosphamide 20 mg/mL, reconstituted with sterile water for injection and stored in various containers at several temperatures, was evaluated. In glass ampuls at 20 to 23°C, approximately 13 and 35% were lost in 1 and 4 weeks, respectively. Under refrigeration at 4°C or frozen at -20°C, the solution lost not more than 3% over 4 weeks.<sup>1090</sup>

Cyclophosphamide (Bristol-Myers Squibb) reconstituted with sterile water for injection to a concentration of 20 mg/mL was found to undergo about 10% degradation in 4 days at 25°C. When the solutions were stored under refrigeration at 5°C, approximately 6% loss occurred in 52 days and 10 to 12% loss occurred in 119 days.<sup>2255</sup>

Immersion of a needle with an aluminum component in cyclophosphamide (Adria) 20 mg/mL resulted in a slight darkening of the aluminum and gas production after a few days at 24°C with protection from light.<sup>988</sup>

### pH Effects

Cyclophosphamide exhibits maximum solution stability over the range of 2 to 10; the rate of decomposition is essentially the same over this broad pH range.<sup>1369</sup> At pH values less than 2 and above 11, increased rates of decomposition have been observed.<sup>1369 2002</sup>

### Syringes

In polypropylene syringes (Plastipak, Becton Dickinson) sealed with blind Luer locking hubs, the 20-mg/mL cyclophosphamide solution lost about 3% in 4 weeks at 4°C and about 10% in 11 to 14 weeks. When frozen at -20°C (with microwave thawing), the solution lost about 4% in 19 weeks. However, the syringe plungers contracted markedly during freezing, resulting in drug solution seeping past the plunger onto the inner surface of the barrel. This seeping poses the risk of bacterial contamination. Furthermore, cyclophosphamide precipitated during microwave thawing and required vigorous shaking for 5 minutes to redissolve. This precipitation during thawing appears not to occur at concentrations less than 8 mg/mL.<sup>1090</sup>

### Central Venous Catheter

Cyclophosphamide (Mead Johnson) 2 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

# Cyclosporine

**AHFS 92:44**

## Products

Cyclosporine is available as a concentrate in 5-mL ampuls.<sup>2929</sup> Each mL of the solution contains cyclosporine 50 mg, polyoxyethylated castor oil (Cremophor EL) 650 mg, and alcohol 278 mg (32.9%).<sup>874 2929 2930</sup>

Cyclosporine concentrate must be diluted prior to administration.<sup>874 2929</sup>

## Trade Name(s)

Sandimmune

## Administration

Cyclosporine concentrate for injection is administered over 2 to 6 hours by intravenous infusion only after dilution.<sup>2929</sup> Each mL of concentrate should be diluted in 20 to 100 mL of dextrose 5% or sodium chloride 0.9%.<sup>2929</sup>

## Stability

Intact ampuls of cyclosporine concentrate should be stored below 30°C and protected from light.<sup>874 2929</sup> Light protection is not required for intravenous admixtures of cyclosporine.<sup>4 1091</sup> The manufacturer recommends that cyclosporine diluted for infusion be discarded after 24 hours.<sup>2929</sup>

## Syringes

The stability of cyclosporine (Novartis) after dilution to a concentration of 0.2 or 2.5 mg/mL in dextrose 5% or sodium chloride 0.9% and packaged as 60 mL in 60-mL polypropylene syringes (Becton Dickinson) was evaluated at room temperature.<sup>2930</sup> Although no physical changes were detected by visual inspection and chemical stability of cyclosporine did not appear to be affected, HPLC analysis revealed the development of an impurity after 1 day that substantially increased until termination of the study after 7 days.<sup>2930</sup> This impurity was not detected in similar samples of cyclosporine that were stored in polypropylene-polyolefin bags.<sup>2930</sup> The authors suggested that the diluted cyclosporine solution could have leached an ingredient used in the manufacture of the black rubber component of the syringe plunger.<sup>2930</sup>

Because such syringes are commonly used to transfer cyclosporine during preparation of IV solutions, an additional shorter test was conducted using 0.4 or 1 mL of undiluted cyclosporine concentrate 50 mg/mL in 1- or 5-mL polypropylene syringes.<sup>2930</sup> The suspected leached component from the black rubber portion of the syringe plunger was not detected within the 10-minute study period.<sup>2930</sup> Therefore, such short-term use of these syringes was considered appropriate provided the period of contact with the drug was less than 10 minutes.<sup>2930</sup>

## Sorption

Simulated infusion studies of cyclosporine (Sandoz) 2 mg/mL in dextrose 5% and sodium chloride 0.9% were performed at a rate

of 0.67 mL/minute over 75 minutes through 70-inch microdrip administration sets (Abbott). Significant amounts of cyclosporine were lost, presumably as a result of sorption to the tubing. Approximately 7% of the dose was lost from the dextrose 5% admixture, and about 13% was lost from the sodium chloride 0.9% admixture. The authors noted that as much as 30% of a pediatric dose could be lost.<sup>1091</sup>

In contrast, no significant cyclosporine loss occurred when 2.38 and 0.495 mg/mL in dextrose 5% and sodium chloride 0.9%, in either glass or polyvinyl chloride (PVC) containers, were delivered over 6 hours by an electronic infusion pump.<sup>1154</sup>

Cyclosporine 0.495 mg/mL in sodium chloride 0.9%, dextrose 5%, maltose 10%, and an electrolyte maintenance solution exhibited loss of delivered cyclosporine due to sorption when run through PVC administration tubing. The delivered cyclosporine concentrations were reduced to about 70% during the first 2 to 4 hours but rose to over 90% after 8 to 24 hours. The extent of sorption was somewhat higher in the electrolyte solutions compared with the sugar solutions. No loss occurred when the cyclosporine solutions were run through polybutadiene administration tubing.<sup>2443</sup>

Stability of cyclosporine 0.2 or 2.5 mg/mL diluted in dextrose 5% or sodium chloride 0.9% in ethylene vinyl acetate (EVA) containers was evaluated at 25°C.<sup>2931</sup> The 2.5-mg/mL solution appeared to be stable for at least 2 weeks under the study conditions.<sup>2931</sup> However, drug concentrations in the 0.2-mg/mL solution decreased to less than 90% within the 2-week study period.<sup>2931</sup> The authors concluded that the absence of impurities detected within this study period combined with the drug loss suggest sorption to the EVA container as the cause for such decreases.<sup>2931</sup>

## Plasticizer Leaching

Polyoxyethylated castor oil (Cremophor EL), a nonionic surfactant, may leach phthalate from PVC containers such as bags of infusion solutions.<sup>4 2929</sup> In 1996, an acceptability limit of no more than 5 parts per million (5 mcg/mL) for diethylhexyl phthalate (DEHP) plasticizer leached from PVC-containing devices (e.g., containers, administration sets, other equipment) was proposed based on a review of metabolic and toxicologic considerations.<sup>2185</sup> FDA later evaluated the safety of DEHP exposure by comparing doses of DEHP received by patients undergoing various medical procedures with a defined tolerable intake value of DEHP, a value that was based upon the results of selected critical toxicity studies in experimental animals.<sup>3100</sup> Based on the results of the safety assessment, FDA concluded that there is little risk posed by exposure to the amount of DEHP released from PVC bags used to store and administer drugs that require an excipient for solubilization *when label instructions for preparation and administration are followed*.<sup>3100</sup> However, such conclusions do not take into account increased risk for adverse effects from DEHP exposure in certain patients (e.g., critically ill male neonates or infants, male infants less than 1 year of age, male

offspring of pregnant or breast-feeding women undergoing certain medical treatments) or potential adverse effects related to aggregate exposure for patients exposed to multiple medical devices, procedures, or intravenous medications known to leach DEHP, for which there are varying levels of concern.<sup>3100 3101</sup>

Cyclosporine (Sandoz) 3 mg/mL in dextrose 5% leached relatively large amounts of DEHP plasticizer from PVC bags. This leaching was due to the surfactant Cremophor EL in the formulation. After 4 hours at 24°C, the DEHP concentration in 50-mL bags of infusion solution was as much as 13 mcg/mL and it increased through 24 hours to 104 mcg/mL. This finding is consistent with the high surfactant concentration (3.9%) in the final admixture solution. The actual amount of DEHP leached from PVC containers and administration sets may vary in clinical situations, depending on surfactant concentration, bag size, and contact time. Non-PVC containers and administration sets should be used to administer cyclosporine solutions.<sup>1683</sup>

Storage of cyclosporine (Sandoz) 3 mg/mL in dextrose 5% in PVC bags at 24°C was shown to cause leaching of significant amounts of DEHP due to the vehicle containing Cremophor EL

and alcohol. Use of glass containers and tubing that does not contain DEHP to administer cyclosporine was recommended.<sup>1092</sup>

Cyclosporine 0.495 mg/mL in sodium chloride 0.9%, dextrose 5%, maltose 10%, and an electrolyte maintenance solution leached relatively large amounts of DEHP plasticizer when run through PVC administration tubing. The bulk of the leaching occurred during the first 4 hours but reached a plateau after 8 hours. About 94 mcg/mL was delivered over 12 hours in the saline solution. The cyclosporine admixtures in electrolyte solutions leached a greater amount of DEHP than those prepared in sugar-containing solutions.<sup>2443</sup>

### Filtration

Use of either a 0.22- or 0.45- $\mu$ m filter reduced the delivered cyclosporine concentration from 2.38- and 0.495-mg/mL solutions in dextrose 5% and sodium chloride 0.9%. A significant (but unspecified) decrease was found in the first sample, taken at 1 minute. At the 6-hour time point, the concentration had returned to the original concentration. The total amount of drug delivered over 6 hours was not quantified.<sup>1154</sup>

# Cytarabine

AHFS 10:00

## Cytosine Arabinoside

### Products

Cytarabine injection is available as a 20-mg/mL solution in 5-mL single-use vials,<sup>2942</sup> 25-mL multidose vials,<sup>2944</sup> and 50-mL pharmacy bulk vials.<sup>2943</sup> Preservative-free 5-mL vials and 50-mL pharmacy bulk vials contain sodium chloride 6.8 mg/mL in water for injection.<sup>2942</sup> <sup>2943</sup> The 25-mL multidose vial contains benzyl alcohol 0.9% in water for injection.<sup>2944</sup> Hydrochloric acid and/or sodium hydroxide may have been added to any of these vials during manufacturing to adjust pH.<sup>2942</sup> <sup>2943</sup> <sup>2944</sup>

Cytarabine injection also is available as a 100-mg/mL solution in preservative-free, single-use 20-mL vials in water for injection.<sup>2941</sup> <sup>2942</sup> Hydrochloric acid and/or sodium hydroxide may have been added during manufacturing to adjust pH.<sup>2941</sup> <sup>2942</sup>

**CAUTION: Care should be taken to ensure that the correct drug product, dose, and administration procedures are used and that no confusion with other products occurs.**

### pH

Preservative-free cytarabine 20-mg/mL injection solution has a pH of 7.4.<sup>2942</sup> <sup>2943</sup> Cytarabine 20-mg/mL injection solution in multidose vials containing benzyl alcohol has a pH of 7.6.<sup>2944</sup> Preservative-free cytarabine 100-mg/mL injection solution has a pH of 7.7.<sup>2941</sup> <sup>2942</sup>

### Sodium Content

Preservative-free cytarabine 20-mg/mL injection contains 0.12 mEq of sodium per mL.<sup>2942</sup> <sup>2943</sup>

### Administration

Cytarabine may be administered by subcutaneous or intrathecal (preservative-free preparations *only*) routes, or intravenously by direct injection or continuous or intermittent infusion.<sup>2941</sup> <sup>2942</sup> <sup>2943</sup> <sup>2944</sup> Some preparations contain preservatives and should *not* be used for intrathecal administration.<sup>2944</sup> Preservative-free pharmacy bulk vials are intended *only* for the preparation of solutions for intravenous infusion.<sup>2943</sup>

**CAUTION: Care should be taken to ensure that the correct drug product, dose, and administration procedures are used and that no confusion with other products occurs.**

### Stability

Intact vials of cytarabine injection should be stored at controlled room temperature.<sup>2941</sup> <sup>2942</sup> <sup>2943</sup> <sup>2944</sup>

A stability study of cytarabine in aqueous solution showed maximum stability in the neutral pH range. It was calculated to retain 90% for 6.5 months at pH 6.9 at 25°C. The rate of decomposition of cytarabine in alkaline solutions is about 10 times as great as in acid solutions.<sup>82</sup>

One manufacturer indicated that for concentrations of 20 and 250 mg/mL in bacteriostatic water for injection, greater than 99% was retained after 5 days of storage at room temperature.<sup>174</sup> However, cytarabine has an aqueous solubility of 100 mg/mL,<sup>4</sup> <sup>1369</sup> and precipitation from more highly concentrated solutions has been observed in varying time frames. In another test, concentrations of 40 and 80 mg/mL in bacteriostatic water for injection were stored in plastic syringes (Becton Dickinson) at 37, 25, 4, and –20°C. Cytarabine remained stable for at least 15 days at 25 and 4°C and for 7 days at 37°C. However, storage at –20°C resulted in a precipitate.<sup>174</sup>

Immersion of a needle with an aluminum component in cytarabine (Upjohn) 20 mg/mL resulted in no visually apparent reaction after 7 days at 24°C.<sup>988</sup>

Cytarabine 12.5 mg/mL in sodium chloride 0.9% did not inhibit the growth of inoculated *Staphylococcus epidermidis* during 21 days at 35°C. At a concentration of 50 mg/mL in sodium chloride, the viability was reduced but not eliminated.<sup>1659</sup> The potential for microbiological growth should be considered when assigning expiration periods.

### Syringes

Cytarabine (Upjohn) 50 mg/mL in polypropylene syringes containing 5, 10, and 20 mL was stable for 29 days at 8 and 21°C in the dark, exhibiting losses of 8.5% or less.<sup>1566</sup>

Cytarabine (Upjohn) 50 mg/2.5 mL was stored at 5 and 25°C in 5-mL plastic syringes (Becton Dickinson) with rubber tip caps and in glass flasks covered with parafilm. After 7 days, samples in the plastic syringes showed a 2 to 3% loss of cytarabine at both temperatures. The 25°C sample in glass also showed a 2% loss, but the 5°C sample in glass showed no loss after 7 days.<sup>759</sup>

### Intrathecal Injections

Bacterially contaminated intrathecal solutions could pose very grave risks; consequently, solutions for intrathecal use should be administered as soon as possible after preparation.<sup>328</sup>

The stability and compatibility of cytarabine (Upjohn), methotrexate (NCI), and hydrocortisone (Upjohn), mixed together in intrathecal injections, were evaluated. Two combinations were tested: (1) cytarabine 50 mg, methotrexate 12 mg (as the sodium salt), and hydrocortisone 25 mg (as the sodium succinate salt); and (2) cytarabine 30 mg, methotrexate 12 mg (as the sodium salt), and hydrocortisone 15 mg (as the sodium succinate salt). Each drug combination was added to 12 mL of Elliott's B solution (NCI), sodium chloride 0.9% (Abbott), dextrose 5% (Abbott), and Ringer's injection, lactated (Abbott), and stored for 24 hours at 25°C. Cytarabine and methotrexate were both chemically stable, with no drug loss after the full 24 hours in all solutions. Hydrocortisone was also stable in sodium chloride

0.9%, dextrose 5%, and Ringer's injection, lactated, with about a 2% drug loss. However, in Elliott's B solution, hydrocortisone was significantly less stable, with a 6% loss in the solution containing 25 mg of hydrocortisone over 24 hours. The solution containing 15 mg of hydrocortisone was worse, with a 5% loss in 10 hours and a 13% loss in 24 hours. The higher pH of Elliott's B solution and the lower concentration of hydrocortisone may have been factors in this increased decomposition. All mixtures were physically compatible during this study, but a precipitate formed after several days of storage.<sup>819</sup>

Elliott's B solution has been recommended as a diluent for cytarabine for intrathecal administration because it is more nearly physiologic.<sup>435</sup> The patient's own spinal fluid also has been recommended.<sup>830</sup>

Cytarabine (Upjohn) 3 mg/mL diluted in Elliott's B solution (Orphan Medical) was packaged as 20 mL in 30-mL glass vials and 20-mL plastic syringes (Becton Dickinson) with Red Cap (Burr) Luer-Lok syringe tip caps. The solution was physically compatible and was chemically stable, exhibiting little or no loss during storage for 48 hours at 4 and 23°C.<sup>1976</sup>

### Implantable Pumps

Cytarabine (Upjohn) 1 mg/mL in Elliott's B solution was evaluated for stability in an implantable infusion pump (Infusaid model 400). In this in vitro assessment, no cytarabine loss occurred in 15 days at 37°C with mild agitation.<sup>767</sup>

### Sorption

Cytarabine (Mack) 0.144 mg/mL in dextrose 5% and in sodium chloride 0.9% exhibited little or no loss due to sorption in polyethylene and polyvinyl chloride (PVC) containers compared to glass containers over 72 hours at room and refrigeration temperatures.<sup>2420 2430</sup>

### Filtration

Cytarabine 100 mg/15 mL was injected as a bolus through a 0.2- $\mu$ m nylon, air-eliminating filter (Ultipor, Pall) to evaluate the effect of filtration on simulated intravenous push delivery. Spectrophotometric evaluation showed that about 96% of the drug was delivered through the filter after flushing with 10 mL of sodium chloride 0.9%.<sup>809</sup>

Cytarabine 10 to 100 mcg/mL exhibited no loss due to sorption to either cellulose nitrate/cellulose acetate ester (Millex OR) or polytetrafluoroethylene (Millex FG) filters.<sup>1416</sup>

### Central Venous Catheter

Cytarabine (Fujisawa) 5 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

# Dacarbazine

## AHFS 10:00

### Products

Dacarbazine is available in vials containing 100 and 200 mg of drug along with anhydrous citric acid and mannitol. Reconstitute the 100- and 200-mg vials with 9.9 and 19.7 mL of sterile water for injection, respectively, to yield solutions containing 10 mg/mL of dacarbazine.<sup>1(1/08)</sup>

### pH

From 3 to 4.<sup>1(1/08)</sup>

### Administration

Dacarbazine is administered as a direct intravenous injection over one minute and as an intravenous infusion in up to 250 mL of dextrose 5% or sodium chloride 0.9% over 15 to 30 minutes.<sup>4</sup> Extravasation may result in severe pain and tissue damage.<sup>1(1/08) 4 377</sup>

In the event of spills or leaks, the manufacturer recommends the use of sulfuric acid 10% in contact for 24 hours to inactivate dacarbazine.<sup>1200</sup>

### Stability

Intact vials of dacarbazine should be stored at 2 to 8°C and protected from light.<sup>1(1/08) 4</sup> However, dacarbazine in intact vials stored at controlled room temperature has been stated to be stable for periods of four weeks<sup>1239 1433</sup> to three months.<sup>1433 2745</sup> The manufacturer also recommends storage of reconstituted solutions for up to eight hours at normal room temperatures and light or up to 72 hours at 4°C.<sup>1(1/08)</sup> However, it has been reported that solutions are stable for at least 24 hours at room temperature (1% decomposition) and at least 96 hours under refrigeration (less than 1% decomposition) when protected from light.<sup>285</sup> A change in color from pale yellow or ivory to pink or red is a sign of decomposition.<sup>4 285 1093</sup>

Immersion of a needle with an aluminum component in dacarbazine (Miles) 10 mg/mL resulted in no visually apparent unexpected reaction after seven days at 24°C.<sup>988</sup>

### Light Effects

Administration of dacarbazine in a room illuminated only with a red photographic light apparently reduced the incidence of disagreeable side effects. The authors attributed this result to a reduced amount of photodegradation of dacarbazine.<sup>469</sup>

Multiple photodegradation products of dacarbazine have been identified and specific concentrations of each are crucially dependent on the pH of the solution.<sup>496</sup>

The effects of daylight and fluorescent light on dacarbazine (Bayer) 4 mg/mL in sodium chloride 0.9% were reported. Exposure to direct sunlight resulted in up to a 12% loss in 30 minutes, and a pink color formed in 35 to 40 minutes. Exposure to indirect daylight resulted in less than a 2% loss in 30 minutes. Solutions protected from light or exposed to fluorescent light lost about 4% of their dacarbazine in 24 hours.<sup>1248</sup>

The photostability of dacarbazine has been shown to increase with the addition of reduced glutathione at about 5 mg/100 mL.<sup>1829</sup>

Dacarbazine (Aventis) 11 mg/mL reconstituted with sterile water for injection in original amber glass vials stored at room temperature exposed to fluorescent light formed a visible precipitate and became yellow in 24 hours and turned pink after 96 hours. About 4% dacarbazine loss occurred in 96 hours, but precipitation limited the utility period to 24 hours. Formation of 2-azahypoxanthine, a potentially toxic decomposition product, was also noted. Under refrigeration protected from light, no precipitation was seen, but red discoloration appeared after 96 hours; little or no loss of dacarbazine occurred in seven days. Reconstituted dacarbazine was stated to be stable for 24 hours at room temperature under fluorescent light and 96 hours refrigerated in the dark.<sup>2386</sup>

Dacarbazine (Aventis) 1.4 mg/mL in dextrose 5% in PVC bags (Fresenius) was stored under a variety of temperature and light conditions. In PVC bags exposed to natural sunlight, the solution turned pink in six hours and red in 48 hours; it developed a precipitate in 96 hours. About 11% dacarbazine loss in three hours and 35% loss in 24 hours. Exposed to or protected from fluorescent light at room temperature and refrigerated, no visible changes occurred in seven days. At room temperature, dacarbazine losses were about 6% in 24 hours exposed to fluorescent light and 7% in 48 hours protected from light. Refrigerated samples protected from light exhibited little or no loss in seven days.<sup>2386</sup>

Simulated infusion of the dacarbazine 1.4-mg/mL solution through transparent (Baxter) and opaque (Codan) infusion tubing over about 110 minutes exposed to light resulted in the delivery of 94% (transparent tubing) and 98% (opaque tubing) of the dacarbazine.<sup>2386</sup>

### Sorption

Dacarbazine (Medac) 0.64 mg/mL in sodium chloride 0.9% exhibited no loss due to sorption in polyethylene and PVC containers compared to glass containers over 48 hours at refrigeration temperature.<sup>2420 2430</sup>

## Dactinomycin

### AHFS 10:00 Actinomycin D

#### Products

Dactinomycin is available in vials containing 0.5 mg of drug with mannitol 20 mg.<sup>2945</sup> Reconstitute with 1.1 mL of sterile water for injection *without* preservatives to yield a gold-colored solution containing approximately 0.5 mg/mL of dactinomycin.<sup>2945</sup> The use of water for injection containing preservatives (e.g., benzyl alcohol, parabens) causes precipitation.<sup>2945</sup>

#### pH

The pH of the reconstituted solution is 5.5 to 7.<sup>1369</sup>

#### Trade Name(s)

Cosmegen

#### Administration

Dactinomycin is administered intravenously or by regional perfusion techniques.<sup>2945</sup> The manufacturer states that only products diluted to concentrations greater than 10 mcg/mL are recommended for administration.<sup>2945</sup> Extravasation should be avoided because of possible corrosion of soft tissue.<sup>377 2945</sup> An inline cellulose ester membrane filter should *not* be used for administration of dactinomycin.<sup>2945</sup> (See Filtration.)

In the event of spills or leaks, the manufacturer recommends the use of trisodium phosphate 5% to inactivate dactinomycin.<sup>1200</sup>

#### Stability

Intact vials of dactinomycin should be stored at controlled room temperature and protected from light and humidity.<sup>2945</sup> The clear, gold-colored, reconstituted solution is stable at room temperature; however, this solution contains no preservative so it has been suggested that unused portions of the injection be discarded.<sup>2945</sup>

Solutions of dactinomycin diluted to concentrations of 10 mcg/mL or greater in water for injection, sodium chloride 0.9%, or dextrose 5% demonstrated chemical stability for up to 10 hours at room temperature in both glass and PVC containers.<sup>2945</sup> Solutions diluted to concentrations less than 10 mcg/mL, however, demonstrated significant losses.<sup>2945</sup> The manufacturer recommends that the reconstituted and diluted product be used within 4 hours of reconstitution when stored at room temperature.<sup>2945</sup>

The drug is reported to be most stable at pH 5 to 7.<sup>1369</sup> A 30-mcg/mL concentration at this pH range exhibits about a 2 to 3% loss in 6 hours at 25°C; at pH 9, an 80% loss occurs under these conditions.<sup>51</sup>

Dactinomycin, reconstituted according to the manufacturer's instructions, was cultured with human lymphoblasts to determine whether its cytotoxic activity was retained. The solution retained cytotoxicity for 24 hours at 4°C and room temperature.<sup>1575</sup>

#### Filtration

Dactinomycin may exhibit considerable binding to cellulose acetate/nitrate (Millex OR) and polytetrafluoroethylene (Millex GV) filters.<sup>1249</sup>

Dactinomycin (MSD) 0.5 mg/L in dextrose 5%, sodium chloride 0.9%, and Ringer's injection, lactated, was filtered over 12 hours through a 5- $\mu$ m stainless steel depth filter (Argyle Filter Connector), a 0.22- $\mu$ m cellulose ester membrane filter (Ivex-2 Filter Set), and a 0.22- $\mu$ m polycarbonate membrane filter (In-Sure Filter Set). No significant reduction in potency due to binding was observed with the stainless steel filter. Approximately 25% of the drug delivered through the polycarbonate filter in the first 10 mL of solution was bound, but binding decreased rapidly thereafter, resulting in only 0.3% of the total delivered dose in 12 hours being bound.<sup>320</sup>

In contrast, filtration through the cellulose ester filter resulted in the binding of about 95 to 99% of the drug in the first 10 mL, with the total cumulative amount of drug bound in 12 hours being 13%. Approximately 50% of the bound drug was released by rinsing 3 times with 100 mL of the same intravenous solutions used in the admixtures.<sup>320</sup>

In another study, dactinomycin 0.5 mg/mL was injected as a bolus through a 0.2- $\mu$ m nylon, air-eliminating filter (Ultipor, Pall) to evaluate the effect of filtration on simulated intravenous push delivery. Spectrophotometric evaluation showed that about 87% of the drug was delivered through the filter after flushing with 10 mL of sodium chloride 0.9%.<sup>809</sup>

Dactinomycin 4 to 50 mcg/mL exhibited a greater than 95% loss due to sorption to cellulose nitrate/cellulose acetate ester filters (Millex OR) and a 50 to 60% loss with polytetrafluoroethylene filters (Millex FG).<sup>1415 1416</sup>

## Dalbavancin Hydrochloride

AHFS 8:12.28.16

### Products

Dalbavancin is available as a lyophilized powder in single-use vials containing dalbavancin hydrochloride equivalent to anhydrous dalbavancin 500 mg as the free base.<sup>2910</sup> Also present in each vial are lactose monohydrate 129 mg and mannitol 129 mg as excipients.<sup>2910</sup> Sodium hydroxide or hydrochloric acid may have been added during manufacturing to adjust the pH.<sup>2910</sup>

Each 500-mg vial should be reconstituted with 25 mL sterile water for injection to yield a solution containing dalbavancin 20 mg/mL.<sup>2910</sup> Alternate between gently swirling and inverting the vial to avoid foaming until contents are completely dissolved; do not shake.<sup>2910</sup> The appropriate dose must be withdrawn and further diluted only in dextrose 5% to a final concentration of 1 to 5 mg/mL.<sup>2910</sup> Saline-based infusion solutions must not be used for dilution as precipitation may result.<sup>2910</sup> The diluted solution should be inspected for particulate matter prior to infusion; if present, the solution should not be used.<sup>2910</sup>

### Trade Name(s)

Dalvance

## Compatibility Information

### Solution Compatibility

#### Dalbavancin HCl

Test Soln Name	Mfr	Mfr	Conc/L or %	Remarks	Ref	C/I
Dextrose 5%		DRT	1 to 5 g	Use within 48 hours at room temperature or refrigerated	2910	C

Sodium chloride 0.9%		DRT		Physically incompatible	2910	I

© Copyright, September 2014. American Society of Health-System Pharmacists, Inc.

### Administration

Dalbavancin is administered by intravenous infusion over 30 minutes after dilution only in dextrose 5% to a concentration of 1 to 5 mg/mL.<sup>2910</sup> If a common infusion line is being used to administer other drugs in addition to dalbavancin, the line should be flushed with dextrose 5% prior to and following infusion of dalbavancin.<sup>2910</sup>

### Stability

Intact vials of dalbavancin hydrochloride should be stored at controlled room temperature.<sup>2910</sup> Dalbavancin hydrochloride is a white to off-white to pale yellow powder that forms a clear, colorless to yellow solution when reconstituted with sterile water for injection.<sup>2910</sup>

The manufacturer states that the reconstituted drug and the diluted solution may be stored under refrigeration or at room temperature; do not freeze.<sup>2910</sup> The total time from reconstitution to dilution to administration should not exceed 48 hours.<sup>2910</sup> Any unused portion should be discarded.<sup>2910</sup>

AHFS 20:12.04.16

### Products

Dalteparin sodium is available as an injection solution with each mL containing 10,000, 12,500, or 25,000 anti-factor Xa international units in water for injection.<sup>3403</sup> The 10,000-international unit/mL concentration is available in preservative-free, single-dose, graduated prefilled syringes containing 10,000 international units (1 mL); the 12,500-international unit/mL concentration is available in preservative-free, single-dose, prefilled syringes containing 2500 international units/0.2 mL.<sup>3403</sup> The 25,000-international unit/mL concentration is available in preservative-free, single-dose, prefilled syringes containing 5000 international units/0.2 mL, 7500 international units/0.3 mL, 12,500 international units/0.5 mL, 15,000 international units/0.6 mL, and 18,000 international units/0.72 mL.<sup>3403</sup> Sodium chloride also may be present.<sup>3403</sup>

Dalteparin sodium injection solution also is available in 3.8-mL multidose vials with each mL containing 25,000 anti-factor Xa international units in water for injection; the solution is preserved with benzyl alcohol 14 mg/mL.<sup>3403</sup>

### pH

The pH of both the unpreserved and preserved injection solutions ranges from 5 to 7.5.<sup>3403</sup>

### Units

Each milligram of dalteparin sodium is equivalent to 156.25 anti-factor Xa international units.<sup>3403</sup>

### Trade Name(s)

Fragmin

### Administration

Dalteparin sodium injection solution is administered by deep subcutaneous injection to patients who are seated or lying down; administration sites should be alternated among a U-shaped area around the navel, the upper outer side of the thigh, and the upper outer quadrangle of the buttock.<sup>3403</sup> Dalteparin sodium injection solution must *not* be administered by intramuscular injection.<sup>3403</sup>

To avoid loss of drug when administering the 12,500- and 25,000-international unit/mL single-dose, prefilled syringes, the air bubble from the syringe should *not* be expelled prior to injection of the drug.<sup>3403</sup>

The manufacturer states that dalteparin sodium should not be mixed with other injections or infusions unless specific compatibility data are available that support such mixing.<sup>3403</sup>

### Stability

Intact containers of dalteparin sodium should be stored at controlled room temperature.<sup>3403</sup> Dalteparin sodium injection solution in prefilled syringes and vials should be visually

inspected for particulate matter and discoloration prior to administration.<sup>3403</sup>

Multidose vials of dalteparin sodium are stable at room temperature for up to 2 weeks from initial vial puncture; any unused solution remaining after 2 weeks should be discarded.<sup>3403</sup>

### Syringes

Dalteparin sodium (Pharmacia & Upjohn) 10,000 international units/mL was packaged in 1-mL polypropylene tuberculin syringes (Becton Dickinson), apparently with the needles left attached, and stored at 25°C exposed to fluorescent light and 2 to 5°C in the dark for 15 days.<sup>2323</sup> Chromogenic assays of the dalteparin activity were variable, but there was no indication of substantial loss of activity.<sup>2323</sup> Dalteparin activity remained at 95% or above of the initial level throughout.<sup>2323</sup> An 8% loss of the benzyl alcohol preservative occurred in 10 days and a 10% loss in 15 days in the samples stored at 25°C.<sup>2323</sup> Benzyl alcohol losses from samples stored at 2 to 5°C were minimal.<sup>2323</sup> Unfortunately, many syringes became nonfunctional during the study with the fluid unable to be expressed through the attached needles, thus necessitating removal of the needles.<sup>2323</sup> The cause of this needle blockage was not addressed.<sup>2323</sup>

Dalteparin sodium (Pharmacia & Upjohn) 10,000 international units/mL from preservative-free ampules and 25,000 international units/mL from multidose vials preserved with benzyl alcohol was packaged in 1-mL (Becton Dickinson) and 3-mL (Sherwood) plastic syringes and stored for 30 days at room temperature and 4°C.<sup>2484</sup> Dalteparin sodium (Pharmacia & Upjohn) 10,000 international units/mL from multidose vials preserved with benzyl alcohol was packaged as 0.75 mL and 1 mL in 1-mL (Becton Dickinson) and 3-mL (Sherwood) plastic syringes, respectively, and stored for 30 days at room temperature and 4°C.<sup>2484</sup> No loss of anti-factor Xa activity was found.<sup>2484</sup>

In another report, the stability of dalteparin sodium (manufacturer unspecified) 25,000 units/mL from multidose vials packaged in 1-mL polypropylene tuberculin syringes (manufacturer unspecified) was evaluated over 10 days stored at 22 and 4°C.<sup>2546</sup> Losses of 7 and 4%, respectively, were found at the two storage temperatures; however, 8 of 45 test syringes stored at 22°C could not be operated to eject the drug.<sup>2546</sup> None of the refrigerated samples exhibited this failure.<sup>2546</sup> The authors speculated that precipitation had resulted in blockage.<sup>2546</sup>

Dalteparin sodium (manufacturer unspecified) 25,000-units/mL injection solution from multidose vials diluted in sodium chloride 0.9% to 2500 units/mL was packaged in tuberculin syringes (manufacturer unspecified) and stored for 28 days under refrigeration at 4°C.<sup>2774</sup> Anti-Xa activity determined by chromogenic assay found no significant differences over the course of 28 days.<sup>2774</sup>

Dalteparin sodium (Pfizer) injection solution (as 10,000-units/mL prefilled syringe) diluted in sodium chloride 0.9% to 1000 units/mL and packaged as 0.5 mL in 1-mL polypropylene tuberculin syringes (Monoject) fitted with Luer-Lok tip caps

(Becton Dickinson) was physically and chemically stable for 30 days under refrigeration at 2 to 8°C when exposed to ambient fluorescent light.<sup>3404</sup>

Selected Revisions June 1, 2019. © Copyright, October 2002.

## Dantrolene Sodium

AHFS 12:20.08

### Products

Dantrolene sodium (Dantrium, Par; Revonto, US WorldMeds) is available as a lyophilized powder in vials containing 20 mg of dantrolene sodium.<sup>3159 3160</sup> Each vial also contains mannitol 3000 mg and sodium hydroxide to adjust the pH.<sup>3159 3160</sup> The powder should be reconstituted by adding 60 mL of sterile water for injection (without a bacteriostatic agent) to each vial; dextrose 5%, sodium chloride 0.9%, and other acidic solutions are incompatible with the drug and should not be used for reconstitution.<sup>3159 3160</sup> Vials should be shaken for approximately 20 seconds<sup>3160</sup> or until the reconstituted solution is clear.<sup>3159 3160</sup> For prophylactic infusion, the contents of the appropriate number of dantrolene vials should be transferred to a sterile intravenous plastic bag; large glass bottles should not be used because precipitate formation has been observed with the use of some glass bottles.<sup>3159 3160</sup> Reconstituted solutions should be visually inspected for particulate matter, discoloration, cloudiness and/or precipitation prior to administration; such solutions should not be used.<sup>3159 3160</sup>

Dantrolene sodium (Ryanodex, Eagle) also is available as a lyophilized powder in single-use vials containing 250 mg of dantrolene sodium.<sup>3161</sup> Each vial also contains mannitol 125 mg, polysorbate 80 25 mg, povidone 4 mg, and sodium hydroxide or hydrochloric acid to adjust the pH.<sup>3161</sup> The powder should be reconstituted by adding 5 mL of sterile water for injection (without a bacteriostatic agent) to each vial; other solutions (e.g., dextrose 5%, sodium chloride 0.9%) should not be used.<sup>3161</sup> Vials should be shaken until the contents form an orange-colored uniform suspension.<sup>3161</sup> The reconstituted suspension should be visually inspected for particulate matter and discoloration prior to administration.<sup>3161</sup> The reconstituted suspension should not be diluted or transferred to another container for infusion.<sup>3161</sup>

### pH

The reconstituted solution of dantrolene sodium (Dantrium, Par; Revonto, US WorldMeds) has a pH of approximately 9.5.<sup>3159 3160</sup>

The reconstituted suspension of dantrolene sodium (Ryanodex Eagle) has a pH of approximately 10.3.<sup>3161</sup>

### Trade Name(s)

Dantrium, Revonto, Ryanodex

### Administration

Dantrolene sodium (Dantrium, Revonto) solution is administered by continuous rapid intravenous push injection or, for prophylactic use, as an intravenous infusion over approximately 1 hour.<sup>3159 3160</sup>

Dantrolene sodium (Ryanodex) suspension is administered by intravenous push (bolus) injection, or, for prophylactic use, intravenously over at least 1 minute.<sup>3161</sup> The drug should be administered into an intravenous catheter while an intravenous infusion solution of sodium chloride 0.9% or dextrose 5% is freely infusing or into a patent indwelling catheter without a freely running infusion solution, in which case the line should be flushed following administration of dantrolene sodium to remove residual drug from the catheter.<sup>3161</sup>

Care should be taken to prevent extravasation of the reconstituted dantrolene sodium solutions or suspension into the surrounding tissues due to the high pH of the formulations and the potential for tissue necrosis.<sup>3159 3160 3161</sup>

### Stability

Intact vials should be stored at controlled room temperature; prolonged exposure to light should be avoided.<sup>3159 3160 3161</sup>

The reconstituted solution should be stored at 15 to 30°C<sup>3159</sup> or 20 to 25°C<sup>3160</sup> and protected from direct light;<sup>3159 3160</sup> the reconstituted suspension should be stored at 20 to 25°C.<sup>3161</sup> The reconstituted solutions or suspension must be used within 6 hours after reconstitution.<sup>3159 3160 3161</sup> Solutions for prophylactic infusion should be prepared immediately prior to administration but are stated to be stable for 6 hours.<sup>3159 3160</sup>

### Additional Compatibility Information

#### Infusion Solutions

Dantrolene sodium (Ryanodex) suspension may be administered into an intravenous catheter while an intravenous infusion solution of sodium chloride 0.9% or dextrose 5% is freely infusing.<sup>3161</sup>

## Daptomycin

AHFS 8:12.28.12

### Products

Daptomycin is available in 2 different formulations: daptomycin (Cubicin, Merck; generic) and Cubicin RF (Merck).<sup>2977 3221</sup> The formulations differ in storage requirements and directions for reconstitution; in addition, there are differences in stability of the products following reconstitution or dilution.<sup>2977 3221</sup>

Daptomycin (Cubicin, Merck; generic) is available as a lyophilized powder or cake in 500-mg single-dose vials with sodium hydroxide to adjust the pH.<sup>2977 3222</sup> Each vial should be reconstituted slowly with 10 mL of sodium chloride 0.9% using a beveled, 21-gauge or smaller transfer needle or a needleless device to direct the stream of diluent against the vial wall.<sup>2977 3222</sup> The vial should be gently rotated to ensure that all of the daptomycin powder becomes wetted.<sup>2977 3222</sup> The reconstituted vial should be allowed to stand undisturbed for 10 minutes, then gently rotated or swirled to ensure complete dissolution.<sup>2977 3222</sup> Vigorous agitation or shaking of the vial should be avoided to minimize foaming.<sup>2977 3222</sup> The reconstituted solution has a daptomycin concentration of 50 mg/mL.<sup>2977 3222</sup>

Cubicin RF (Merck) is available as a lyophilized powder in 500-mg single-dose vials.<sup>3221</sup> Each vial also contains sucrose 713 mg and sodium hydroxide to adjust the pH.<sup>3221</sup> Each vial should be reconstituted *only* with 10 mL of sterile water for injection or bacteriostatic water for injection; a syringe with a beveled, 21-gauge or smaller transfer needle should be used to slowly direct the stream of diluent against the vial wall.<sup>3221</sup> Saline-based diluents must *not* be used to reconstitute Cubicin RF because the resulting solution is hyperosmotic and may lead to infusion-site reactions if administered as a direct injection (e.g., over 2 minutes).<sup>3221</sup> The vial should be rotated or swirled for a few minutes, as needed, to ensure complete dissolution of the powder.<sup>3221</sup> The reconstituted solution has a daptomycin concentration of 50 mg/mL.<sup>3221</sup>

### pH

The pH of the 50-mg/mL reconstituted solution of Cubicin RF is 6.8.<sup>3221</sup>

### Trade Name(s)

Cubicin, Cubicin RF

### Administration

Daptomycin is administered by intravenous injection (*only* in adult patients) or by intravenous infusion (in adult and pediatric patients).<sup>2977 3221 3222</sup>

For intravenous injection in adult patients *only*, the appropriate volume of the reconstituted solution should be withdrawn from the vial using a syringe with a beveled, 21-gauge or smaller needle and may be administered without further dilution over 2 minutes.<sup>2977 3221 3222</sup> The drug should *not* be administered to pediatric patients by direct intravenous injection.<sup>2977 3221</sup>

To prepare intravenous infusions of daptomycin, a syringe with a beveled, 21-gauge or smaller needle should be used to

withdraw the appropriate volume of reconstituted solution from the vial and transfer the drug to a bag containing the appropriate volume of infusion solution.<sup>2977 3221 3222</sup>

For intravenous infusion in adult patients, the appropriate volume of the reconstituted solution should be withdrawn from the vial and transferred to an infusion bag containing 50 mL of sodium chloride 0.9% to be administered over 30 minutes.<sup>2977 3221 3222</sup>

For intravenous infusion in pediatric patients 1–6 years of age, the appropriate volume of the reconstituted solution should be withdrawn from the vial and transferred to an infusion bag containing 25 mL of sodium chloride 0.9%.<sup>2977 3221</sup> The diluted solution should be administered over 60 minutes; the infusion rate should be maintained at 0.42 mL/min over the 60-minute period of infusion.<sup>2977 3221</sup> The manufacturer states that the drug should be avoided in infants younger than 12 months of age based on adverse effects observed in animals.<sup>2977 3221</sup>

For intravenous infusion in pediatric patients 7–17 years of age, the appropriate volume of the reconstituted solution should be withdrawn from the vial and transferred to an infusion bag containing 50 mL of sodium chloride 0.9%.<sup>2977 3221</sup> The diluted solution should be administered over 30 minutes; the infusion rate should be maintained at 1.67 mL/min over the 30-minute period of infusion.<sup>2977 3221</sup>

If a common infusion line is being used to administer other drugs, the line should be flushed with a compatible infusion solution prior to and following infusion of daptomycin.<sup>2977 3221 3222</sup>

### Stability

Daptomycin is a pale yellow to light brown powder or cake that forms a pale yellow to light brown solution upon reconstitution.<sup>2977 3221 3222</sup> Vials of daptomycin are for single dose only; any unused portion should be discarded.<sup>2977 3221 3222</sup>

Intact vials of daptomycin (Cubicin, Merck; generic) should be stored under refrigeration at 2 to 8°C.<sup>2977 3222</sup> Although refrigerated storage is required, one manufacturer has stated that the drug may be stored at room temperature for 12 months.<sup>2745</sup> Exposure to excessive heat should be avoided.<sup>2977 3222</sup> When reconstituted as directed, this formulation of daptomycin is stable in the vial for 12 hours at room temperature and up to 48 hours under refrigeration at 2 to 8°C; once diluted for infusion, the drug also is stable in the infusion bag for 12 hours at room temperature and 48 hours under refrigeration at 2 to 8°C.<sup>2977 3222</sup> However, the time after reconstitution in the vial and after dilution for infusion in the bag should not exceed a combined time of 12 hours at room temperature or 48 hours under refrigeration for this formulation.<sup>2977 3222</sup>

Intact vials of the Cubicin RF (Merck) formulation of daptomycin should be stored at controlled room temperature.<sup>3221</sup> When reconstituted as directed with sterile water for injection, Cubicin RF is stable in the vial for 1 day at 20 to 25°C or

3 days at 2 to 8°C; if diluted in sodium chloride 0.9% immediately following reconstitution, the drug is stable in the infusion bag for 19 hours at 20 to 25°C or 3 days at 2 to 8°C.<sup>3221</sup> When reconstituted as directed with bacteriostatic water for injection, Cubicin RF is stable in the vial for 2 days at 20 to 25°C or 3 days at 2 to 8°C; if diluted in sodium chloride 0.9% immediately following reconstitution, the drug is stable in the infusion bag for 2 days at 20 to 25°C or 5 days at 2 to 8°C.<sup>3221</sup>

The manufacturer states that daptomycin is *not* compatible in dextrose-containing solutions.<sup>2977 3221 3222</sup> (See Additional Compatibility Information: Peritoneal Dialysis Solutions.)

**Syringes**

The Cubicin RF formulation of daptomycin reconstituted with sterile water for injection to yield a concentration of 50 mg/mL and packaged in polypropylene syringes with an elastomeric plunger stopper is stable for 1 day at 20 to 25°C or 3 days at 2 to 8°C; when similarly reconstituted with bacteriostatic water for injection, the drug is stable for 2 days at 20 to 25°C or 5 days at 2 to 8°C.<sup>3221</sup>

**Ambulatory Pumps**

During stability studies of daptomycin stored in ReadyMed elastomeric infusion pumps, an impurity (i.e., 2-mercaptobenzothiazole) was found to leach from the pump system into the daptomycin solution.<sup>2977 3221 3222</sup> Therefore, manufacturers state that the drug should not be used in conjunction with ReadyMed elastomeric infusion pumps.<sup>2977 3221 3222</sup>

**Filtration**

A study was performed on the compatibility of various syringe filters with the Cubicin (Cubist) formulation of daptomycin after reconstitution of each vial with 10 mL of sodium chloride 0.9%.<sup>3198 3199</sup> Visual assessment and potency of the filtered solution were compared with those of the unfiltered control.<sup>3198 3199</sup> No changes in color or clarity occurred.<sup>3198 3199</sup> Decreases in potency of the reconstituted and filtered solutions compared with the reconstituted and unfiltered solutions ranged from 0.39 to 2.23%.<sup>3198 3199</sup> The syringe filters noted in Table 1 were found to be compatible with the reconstituted drug.<sup>3198 3199</sup>

**Table 1. Syringe filters compatible with reconstituted Cubicin<sup>3198 3199</sup>**

Manufacturer	Syringe Filter
Covidien	Monoject 5-µm stainless steel (M305)
Becton Dickinson	Nokor 5-µm acrylic copolymer/nylon (305200)

## Additional Compatibility Information

### *Peritoneal Dialysis Solutions*

Daptomycin (Cubicin, Novartis) 20 mg/L was physically compatible with both Physioneal 35 with dextrose 1.36% (Baxter) and Physioneal 35 with dextrose 2.27% (Baxter) peritoneal dialysis solutions at 25°C for up to 24 hours in polyvinyl chloride (PVC) containers.<sup>2979</sup>

Daptomycin also was physically compatible with both of these solutions at 37°C for up to 6 hours in PVC containers.<sup>2979</sup>

Daptomycin (Cubicin, Cubist) 50 mg/L, 100 mg/L, and 200 mg/L was physically compatible with Physioneal 40 with 1.36%

dextrose (Baxter) and Nutrineal (Baxter) at 4, 25, and 37°C in PVC and glass containers for at least 24 hours.<sup>2980</sup>

### *Heparin Locks*

A combination of daptomycin (Cubicin, Cubist) 5 mg/mL and heparin sodium (Hospira) 100 units/mL in Ringer's injection, lactated was evaluated for stability as a lock solution stored in 5-mL aliquots in 5-mL polypropylene syringes (Becton Dickinson) at 4 and -20°C.<sup>2978</sup> The solution remained clear and colorless on visual inspection and little or no loss of either drug occurred throughout the 14-day study period.<sup>2978</sup>

## Daunorubicin–Cytarabine Liposomal

AHFS 10:00

### Products

The fixed combination of daunorubicin–cytarabine liposomal is available as a purple, lyophilized cake in single-dose (preservative-free) vials containing 44 mg of daunorubicin and 100 mg of cytarabine encapsulated in liposomes.<sup>3369</sup> Each vial also contains distearoyl phosphatidylcholine (DSPC) 454 mg, distearoyl phosphatidylglycerol (DSPG) 132 mg, and cholesterol HP 32 mg, which form the liposomal membrane, as well as copper gluconate 100 mg, triethanolamine 4 mg, and sucrose 2.054 g.<sup>3369</sup>

**CAUTION: Care should be taken to ensure that the correct drug product, dose, and administration procedures are used and that no confusion with other products occurs.** Although other daunorubicin and cytarabine products exist, they are sufficiently different from daunorubicin–cytarabine liposomal that extrapolating information to or from other formulations or substituting other products is inappropriate.<sup>3369</sup>

To prepare a diluted solution for infusion, the number of vials of the drug required to achieve the appropriate dose (based on the daunorubicin component) should be allowed to equilibrate to room temperature for 30 minutes.<sup>3369</sup> Each vial should then be reconstituted with 19 mL of sterile water for injection.<sup>3369</sup> Using a timer set for 5 minutes, each vial should be swirled, gently inverting the vial every 30 seconds.<sup>3369</sup> Vials should not be heated, vortexed, or shaken vigorously.<sup>3369</sup> Each mL of the resulting reconstituted product contains 2.2 mg of daunorubicin and 5 mg of cytarabine.<sup>3369</sup> The reconstituted product should be allowed to rest for 15 minutes.<sup>3369</sup> After resting, each vial should be gently inverted 5 times prior to withdrawing the total volume required of the reconstituted product and transferring this volume to an infusion bag containing 500 mL of sodium chloride 0.9% or dextrose 5%.<sup>3369</sup> The bag should be gently inverted to mix the solution.<sup>3369</sup>

### Copper Content

The reconstituted daunorubicin–cytarabine product contains copper gluconate 5 mg/mL, 14% of which is elemental copper.<sup>3369</sup> Copper gluconate is required for stable daunorubicin encapsulation inside the liposome.<sup>1711</sup>

### Trade Name(s)

Vyxeos

### Administration

Daunorubicin–cytarabine liposomal should be administered only by the intravenous route; the drug should *not* be administered by the intramuscular or subcutaneous routes.<sup>3369</sup>

Diluted solutions of daunorubicin–cytarabine liposomal for infusion should be administered at a constant rate over 90 minutes through a central venous catheter or a peripherally inserted central catheter (PICC) using an infusion pump.<sup>3369</sup> The line used to administer the drug should be flushed with sodium chloride 0.9% or dextrose 5% following completion of the infusion.<sup>3369</sup> Interruption of the infusion, reduction in the rate of infusion, or discontinuance of the drug may be necessary if hypersensitivity reactions occur; the product labeling should be consulted for additional details on management of hypersensitivity reactions.<sup>3369</sup>

Severe local necrosis has occurred with extravasation of daunorubicin; care should be taken to avoid extravasation.<sup>3369</sup>

As with other toxic drugs, applicable special handling and disposal procedures for daunorubicin–cytarabine liposomal should be followed.<sup>3369</sup>

**CAUTION: Care should be taken to ensure that the correct drug product, dose, and administration procedures are used and that no confusion with other products occurs.**

### Stability

Intact vials of daunorubicin–cytarabine liposomal for injection should be stored under refrigeration at 2 to 8°C.<sup>3369</sup> Vials should be stored upright and in the original carton to protect from light.<sup>3369</sup> The reconstituted product is a homogenous opaque purple dispersion essentially free of visible particulates; a homogenous translucent deep purple dispersion free from visible particulates forms upon dilution in sodium chloride 0.9% or dextrose 5%.<sup>3369</sup> The solution should be visually inspected for particulate matter and discoloration prior to administration; only solutions without visible particles should be administered.<sup>3369</sup>

The reconstituted product, if not diluted immediately, is stable for up to 4 hours at 2 to 8°C; the diluted solution for infusion, if not administered immediately following dilution of the reconstituted product, is stable for up to 4 hours at 2 to 8°C.<sup>3369</sup> Any unused portion should be discarded.<sup>3369</sup>

### Filtration

Diluted solutions of daunorubicin–cytarabine liposomal for infusion should *not* be infused through an inline filter.<sup>3369</sup>

# Daunorubicin Hydrochloride

## AHFS 10:00

### Products

Daunorubicin hydrochloride injection is available as a 5-mg/mL solution in single-dose vials containing daunorubicin base 20 mg.<sup>2950</sup> Each mL also contains sodium chloride 9 mg, hydrochloric acid to adjust the pH, and water for injection.<sup>2950</sup>

**CAUTION: Care should be taken to ensure that the correct drug product, dose, and administration procedures are used and that no confusion with other products occurs.**

### pH

From 3 to 4.<sup>2950</sup>

### Trade Name(s)

Cerubidine

### Administration

Daunorubicin hydrochloride is administered intravenously *only*.<sup>2950</sup> The drug must never be given by the intramuscular or subcutaneous routes.<sup>2950</sup> Extravasation will result in severe local tissue necrosis.<sup>2950</sup>

The dose may be diluted by drawing the desired dose into a syringe containing 10 to 15 mL of sodium chloride 0.9% and injecting the contents into the sidearm or tubing of a rapidly flowing intravenous infusion of dextrose 5% or sodium chloride 0.9%.<sup>2950</sup>

In the event of spills or leaks, Wyeth-Ayerst recommends the use of sodium hypochlorite 5% (household bleach) to inactivate daunorubicin hydrochloride until a colorless liquid results.<sup>1200</sup>

**CAUTION: Care should be taken to ensure that the correct drug product, dose, and administration procedures are used and that no confusion with other products occurs.**

### Stability

Intact vials of daunorubicin hydrochloride injection should be stored under refrigeration at 2 to 8°C in the original carton to

protect from light.<sup>2950</sup> The manufacturer states that the solution prepared for administration is stable for 24 hours at 20 to 25°C.<sup>2950</sup>

Immersion of a needle with an aluminum component in daunorubicin hydrochloride (Ives) 5 mg/mL resulted in a darkening of the solution, with black patches forming on the aluminum in 12 to 24 hours at 24°C with protection from light.<sup>988</sup>

### pH Effects

Daunorubicin hydrochloride appears to have pH-dependent stability in solution.<sup>526 1250</sup> Solutions of daunorubicin hydrochloride are less stable at pH values above 8. Decomposition occurs, as indicated by a color change from red to blue-purple. The drug becomes progressively more stable as the pH of drug-infusion solution admixtures becomes more acidic, from 7.4 down to 4.5.<sup>526</sup> The pH range of maximum stability was reported to be approximately 4.5 to 5.5. Below pH 4, decomposition increases substantially.<sup>1207</sup>

### Light Effects

Protection of the injection from light is recommended.<sup>2950</sup> Photoinactivation of daunorubicin hydrochloride exposed to radiation of 366 nm and fluorescent light has been reported.<sup>1094</sup> One source indicates that significant losses due to light exposure for a sufficient time may occur at concentrations below 100 mcg/mL.<sup>1369</sup> However, in clinical concentrations at or above 500 mcg/mL, no special light protection appeared to be necessary.<sup>1369</sup>

### Syringes

Daunorubicin hydrochloride (Rhône-Poulenc) 2 mg/mL in polypropylene syringes exhibited little loss in 43 days at 4°C.<sup>1460</sup>

### Filtration

Daunorubicin hydrochloride binds only slightly to cellulose acetate/nitrate (Millex OR) and polytetrafluoroethylene (Millex FG) filters.<sup>1249 1415 1416</sup>

## Deferoxamine Mesylate

AHFS 64:00

### Products

Deferoxamine mesylate is available in vials containing 500 mg and 2 g of sterile drug in dry form. For intramuscular injection, reconstitute the 500-mg and 2-g vials with 2 and 8 mL, respectively, to yield solutions providing deferoxamine mesylate 213 mg/mL. For intravenous and subcutaneous infusion, reconstitute the 500-mg and 2-g vials with 5 and 20 mL, respectively, to yield solutions providing deferoxamine mesylate 95 mg/mL.<sup>1(2/09)</sup>

### Tonicity

Reconstituted deferoxamine 95 mg/mL is isotonic.<sup>1(2/09)</sup>

### Trade Name(s)

Desferal

### Administration

Deferoxamine mesylate is administered by intramuscular injection, subcutaneous infusion using a portable infusion control device, and by slow intravenous infusion after dilution at an initial rate not exceeding 15 mg/kg/hr for the first 1000 mg. Subsequent dosing should be at a decreased rate not exceeding 125 mg/hr.<sup>1(2/09)</sup>

### Stability

Store the intact vials at temperatures not exceeding 25°C. Deferoxamine mesylate is a white to off-white powder that forms a clear colorless to yellow solution when reconstituted with sterile water for injection. The manufacturer states that reconstitution with other diluents may result in precipitation. Turbid solutions should not be used. The reconstituted solution

is stable for 24 hours at room temperature. The solution should not be refrigerated.<sup>1(2/09)</sup>

For intravenous infusion, sodium chloride 0.9%, dextrose 5%, or Ringer's injection, lactated are recommended for use as diluents.<sup>1(2/09)</sup>

### Syringes

Deferoxamine mesylate (Ciba-Geigy) 250 mg/mL in sterile water for injection 3 mL in 10-mL polypropylene infusion pump syringes (Pharmacia Deltec) had little loss in 14 days of storage at 30°C.<sup>1967</sup>

### Ambulatory Pumps

Deferoxamine mesylate stability was evaluated at concentrations of 210, 285, and 370 mg/mL in sterile water for injection in PVC infusion cassette reservoirs (Pharmacia Deltec) stored at 20 to 23°C. Analysis was inconclusive because of an inordinate degree of assay variation. However, a white precipitate formed in varying time periods, depending on the concentration. Higher concentrations precipitated more rapidly than lower concentrations. In the 370-mg/mL concentration, precipitation was observed in as little as 1 day while the 285- and 210-mg/mL concentrations developed precipitation in 9 and 17 days, respectively. This study's inordinate degree of assay variability coupled with the propensity for precipitation preclude a reasonable determination of stability for these high concentrations of deferoxamine mesylate.<sup>672</sup>

### Elastomeric Reservoir Pumps

Deferoxamine mesylate (Ciba-Geigy) 5 mg/mL in both dextrose 5% and sodium chloride 0.9% was evaluated for binding potential to natural rubber elastomeric reservoirs (Baxter). No binding was found after storage for 2 weeks at 35°C with gentle agitation.<sup>2014</sup>

## Defibrotide Sodium

AHFS 20:12.92

### Products

Defibrotide sodium is available as an 80-mg/mL concentrate for injection in vials containing 2.5 mL of solution; vials contain no preservative and are intended for single-patient use.<sup>3148</sup> Each mL of solution also contains sodium citrate 10 mg in water for injection.<sup>3148</sup> Hydrochloric acid and/or sodium hydroxide may have been added to adjust the pH.<sup>3148</sup>

Defibrotide sodium concentrate for injection must be diluted prior to administration.<sup>3148</sup> The appropriate volume of the concentrate should be withdrawn from the vial and transferred to an infusion bag containing dextrose 5% or sodium chloride 0.9%.<sup>3148</sup> The diluted solution for infusion should be gently mixed and should have a final concentration of 4 to 20 mg/mL.<sup>3148</sup>

### pH

Defibrotide sodium concentrate for injection has a pH ranging from 6.8 to 7.8.<sup>3148</sup>

### Trade Name(s)

Defitelio

### Administration

Defibrotide sodium is administered intravenously as an infusion over 2 hours after dilution in dextrose 5% or sodium chloride 0.9%.<sup>3148</sup> The final diluted solution for infusion should be administered through an infusion set containing a 0.2- $\mu$ m inline

filter.<sup>3148</sup> The intravenous infusion line being used to administer defibrotide sodium should be flushed with dextrose 5% or sodium chloride 0.9% immediately prior to and following administration of the drug.<sup>3148</sup>

### Stability

Intact vials of defibrotide sodium should be stored at controlled room temperature.<sup>3148</sup> Defibrotide sodium concentrate for injection is a clear, light yellow to brown solution; the diluted solution for infusion may vary from colorless to light yellow, depending upon the diluent and the final concentration of the drug in the solution.<sup>3148</sup> The diluted solution for infusion should be visually inspected for particulate matter and discoloration prior to administration; only clear solutions without visible particulates should be used.<sup>3148</sup>

The manufacturer states that diluted solutions for infusion should be used within 4 hours if stored at room temperature or 24 hours if stored under refrigeration.<sup>3148</sup>

Vials are intended for single-patient use only.<sup>3148</sup> The manufacturer states that up to 4 doses of the diluted solution for infusion may be prepared at one time if refrigerated.<sup>3148</sup> Partially used vials should be discarded.<sup>3148</sup>

### Filtration

Defibrotide solution diluted for infusion should be administered through an infusion set containing a 0.2- $\mu$ m inline filter.<sup>3148</sup>

AHFS 8:12.18

### Products

Delafloxacin meglumine is available as a lyophilized powder in single-dose vials containing 300 mg of delafloxacin.<sup>3332</sup> Each vial also contains edetate disodium 3.4 mg, meglumine 59 mg, and sulfobutylether  $\beta$ -cyclodextrin 2400 mg.<sup>3332</sup> The contents of each 300-mg vial should be reconstituted with 10.5 mL of dextrose 5% or sodium chloride 0.9%, and the vial should be shaken vigorously until all of the powder is dissolved to yield a 25-mg/mL solution.<sup>3332</sup>

The reconstituted solution must be further diluted with dextrose 5% or sodium chloride 0.9% to a total volume of 250 mL prior to intravenous administration.<sup>3332</sup> To prepare a 300-mg dose, 12 mL of the infusion solution should be removed from the bag prior to addition of 12 mL (300 mg) of the drug;<sup>3332</sup> to prepare a 200-mg dose, 8 mL of the infusion solution should be removed from the bag prior to addition of 8 mL (200 mg) of the drug.<sup>3332 3333</sup>

### Equivalency

Delafloxacin meglumine 433 mg is equivalent to 300 mg of delafloxacin as the free acid.<sup>3332</sup>

### Trade Name(s)

Baxdela

DOI: 10.37573/9781585286850.116

### Administration

Delafloxacin meglumine is administered intravenously over 60 minutes following dilution of the reconstituted solution in sodium chloride 0.9% or dextrose 5%.<sup>3332</sup> If a common infusion line is being used to administer other drugs in addition to delafloxacin meglumine, the line should be flushed with sodium chloride 0.9% or dextrose 5% prior to and following infusion of delafloxacin meglumine.<sup>3332</sup> Delafloxacin is incompatible with any solutions that contain multivalent cations (e.g., calcium, magnesium).<sup>3332</sup>

### Stability

Delafloxacin meglumine lyophilized powder is a light yellow to tan cake that may have cracking, shrinkage, and slight variations in texture and color; upon reconstitution, a clear yellow to amber-colored solution forms.<sup>3332</sup> Intact vials of delafloxacin meglumine should be stored at controlled room temperature.<sup>3332</sup> The reconstituted solution and solutions diluted for infusion may be stored at 2 to 8°C or 20 to 25°C for up to 24 hours and should not be frozen.<sup>3332</sup> Any unused portions should be discarded.<sup>3332</sup> Solutions should be visually inspected for particulate matter and discoloration prior to administration.<sup>3332</sup>

# Dexamethasone Sodium Phosphate

**AHFS 68:04**

## Products

Dexamethasone sodium phosphate is available as dexamethasone phosphate 4 mg/mL with sodium sulfite 1 mg/mL, benzyl alcohol 10 mg/mL, sodium citrate for isotonicity, and citric acid and sodium hydroxide to adjust pH in water for injection. It is also available as dexamethasone phosphate 10 mg/mL with sodium metabisulfite 1 mg/mL, benzyl alcohol 10 mg/mL, sodium citrate 10 mg/mL, and citric acid and sodium hydroxide to adjust pH in water for injection.<sup>1(6/06)</sup>

## pH

Dexamethasone sodium phosphate injections have a pH range from 7 to 8.5.<sup>1(6/06)</sup> 17 Dexamethasone sodium phosphate (David Bull) 0.5, 1, and 2 mg/mL in sodium chloride 0.9% for continuous subcutaneous infusion had pH values of 7.3, 7.3, and 7.5, respectively.<sup>2161</sup>

## Osmolality

The osmolality of the 4-mg/mL concentration of dexamethasone sodium phosphate (Elkins-Sinn) was determined by freezing-point depression to be 356 mOsm/kg.<sup>1071</sup> Another study reported the osmolality of a dexamethasone injection (manufacturer unspecified) to be 255 mOsm/kg.<sup>1233</sup>

Dexamethasone sodium phosphate (David Bull) 0.5, 1, and 2 mg/mL in sodium chloride 0.9% for continuous subcutaneous infusion had osmolalities of 269, 260, and 238 mOsm/kg, respectively.<sup>2161</sup>

## Administration

Dexamethasone sodium phosphate 4- and 10-mg/mL may be administered intravenously by direct injection slowly over 1 to several minutes or by continuous or intermittent intravenous infusion and by intramuscular, intra-articular, intrasynovial, intralesional, or soft-tissue injection.<sup>1(6/06)</sup> 4

## Stability

The injections should be protected from light and freezing. In addition, dexamethasone sodium phosphate is heat labile and should not be autoclaved to sterilize the vial's exterior.<sup>1(6/06)</sup> 4

Dexamethasone sodium phosphate (Lyphomed) was diluted to a concentration of 1 mg/mL with bacteriostatic sodium chloride 0.9% and packaged in 10-mL sterile glass vials. The dilutions remained clear and colorless, and little or no loss of dexamethasone was found after 28 days of storage at 4 and 22°C.<sup>1940</sup>

Dexamethasone sodium phosphate under simulated summer conditions in paramedic vehicles was exposed to temperatures ranging from 26 to 38°C over 4 weeks. Analysis found no loss of the drug under these conditions.<sup>2562</sup>

## Syringes

The stability of dexamethasone sodium phosphate (Organon Teknica) 10 mg/mL repackaged into 1- and 2.5-mL Glaspak (Becton Dickinson) and 1- and 3-mL plastic (Monoject, Sherwood) syringes was reported. Samples in the Glaspak syringes were stored at 4 and 23°C, exposed to light and both shaken and unshaken during storage. Samples in plastic syringes were stored only at 23°C. Not more than 5% loss occurred in the Glaspak syringes after 91 days at either temperature. Similarly, losses in the 3-mL plastic syringes were 7% or less after 55 days while losses in the 1-mL plastic syringes were 3% or less in 35 days; these time periods were the maximum that the plastic syringes were evaluated in this study. No contamination by the rubber components was found to leach into the drug solution.<sup>1897</sup>

## Sorption

Dexamethasone sodium phosphate was shown not to exhibit sorption to polyvinyl chloride (PVC) bags and tubing, polyethylene tubing, Silastic tubing, and polypropylene syringes.<sup>536 606</sup>

## Filtration

Dexamethasone sodium phosphate (MSD) 4 mg/L in dextrose 5%, sodium chloride 0.9%, and Ringer's injection, lactated filtered over 12 hours through a 5- $\mu$ m stainless steel depth filter (Argyle Filter Connector), a 0.22- $\mu$ m cellulose ester membrane filter (Ivex-2 Filter Set), and a 0.22- $\mu$ m polycarbonate membrane filter (In-Sure Filter Set), showed no significant reduction due to binding to the filters.<sup>320</sup>

In another study, dexamethasone sodium phosphate (MSD) 4 mg/L in dextrose 5% and sodium chloride 0.9% did not display significant sorption to a 0.45- $\mu$ m cellulose membrane filter (Abbott S-A-I-F) during an 8-hour simulated infusion.<sup>567</sup>

## Central Venous Catheter

Dexamethasone sodium phosphate (American Regent) 0.5 mg/mL in dextrose 5% was found to be compatible with the ARROW-g+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

Test Drug	Mfr	Amt	Mfr	Amt	Remarks	Ref	C/I
Ondansetron HCl	CER	0.25 mg/mL <sup>d</sup>	ES	1 mg/mL <sup>d</sup>	Visually compatible for 3 days at 4°C. Precipitation of ondansetron observed at 7 days as opaque white ring	1882	C
Ondansetron HCl	CER	0.33 mg/mL <sup>d</sup>	ES	0.33 and 0.67 mg/mL <sup>d</sup>	Visually compatible. No loss of either drug in 30 days at 4°C then 2 days at 23°C	1882	C
Ondansetron HCl	CER	0.5 mg/mL <sup>d</sup>	ES	0.5 mg/mL <sup>d</sup>	Visually compatible. No loss of either drug in 30 days at 4°C then 2 days at 23°C	1882	C
Ondansetron HCl	CER	0.5 mg/mL <sup>d</sup>	ES	1 mg/mL <sup>d</sup>	Visually compatible for 3 days at 4°C. Precipitation of ondansetron observed at 5 days as opaque white ring	1882	C
Ondansetron HCl	CER	0.67 mg/mL <sup>d</sup>	ES	0.33 and 0.67 mg/mL <sup>d</sup>	Visually compatible. No loss of either drug in 30 days at 4°C then 2 days at 23°C	1882	C
Ondansetron HCl	CER	1.07 mg/mL <sup>d</sup>	ES	0.33 mg/mL <sup>d</sup>	Visually compatible. No loss of either drug in 30 days at 4°C then 2 days at 23°C	1882	C
Ondansetron HCl	CER	1.07 mg/mL <sup>d</sup>	ES	0.67 mg/mL <sup>d</sup>	Heavy white precipitate in 72 hr at 4°C. 25 to 30% loss of both drugs	1882	I
Ondansetron HCl		4 mg/2 mL	OM <sup>h</sup>	4 mg/1 mL	Physically incompatible within 3 min	2767	I
Ondansetron HCl		4 mg/2 mL	<sup>i</sup>	4 mg/1 mL	Physically compatible	2767	C
Oxycodone HCl	NAP	200 mg/20 mL	FAU	40 mg/10 mL	Visually compatible. Under 4% concentration change in 24 hr at 25°C	2600	C
Palonosetron HCl	MGI	0.25 mg/5 mL	AMR	3.3 mg/5 mL <sup>e f</sup>	Physically compatible. Little loss of either drug in 48 hr at 23°C in light and 14 days at 4°C	2552	C
Pantoprazole sodium	<sup>g</sup>	4 mg/1 mL		10 mg/1 mL	Precipitates immediately	2574	I
Ranitidine HCl	GL	50 mg/5 mL	ME	4 mg	Physically compatible for 4 hr at ambient temperature under fluorescent light	1151	C
Tramadol HCl	GRU	33.33, 16.66, 8.33 mg/mL <sup>f</sup>	ME	3.33, 1.67, 1.33, 0.33 mg/mL <sup>f</sup>	Physically compatible and both drugs chemically stable for 5 days at 25°C protected from light	2747	C

<sup>a</sup> Mixed in equal quantities. Final concentration is one-half the indicated concentration.

<sup>b</sup> Mixed in varying quantities to yield the final concentrations noted.

<sup>c</sup> Diluted with water.

<sup>d</sup> Diluted with sodium chloride 0.9% drawn into a syringe prior to drugs to yield the concentrations cited.

<sup>e</sup> Tested in dextrose 5%.

<sup>f</sup> Tested in sodium chloride 0.9%.

<sup>g</sup> Test performed using the formulation WITHOUT edetate disodium.

<sup>h</sup> Contained benzyl alcohol as a preservative.

<sup>i</sup> Contained parabens as preservatives.

**Y-Site Injection Compatibility (1:1 Mixture)****Dexamethasone sodium phosphate**

<sup>a</sup> Tested in dextrose 5%.

<sup>b</sup> Tested in sodium chloride 0.9%.

<sup>c</sup> Tested in sodium chloride 0.45%.

<sup>d</sup> Tested in dextrose 5%, Ringer's injection, lactated, sodium chloride 0.45%, and sodium chloride 0.9%.

<sup>e</sup> Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>f</sup> Tested in bacteriostatic sodium chloride 0.9% preserved with benzyl alcohol 0.9%.

<sup>g</sup> Tested in dextrose 5%, Ringer's injection, lactated, and sodium chloride 0.9%.

<sup>h</sup> Tested in sterile water for injection.

<sup>i</sup> Tested in dextrose 5% with sodium bicarbonate 0.05 mEq/mL.

<sup>j</sup> Lyophilized formulation tested.

<sup>k</sup> Refer to Appendix for the composition of the parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>l</sup> Test performed using the formulation WITHOUT edetate disodium.

<sup>m</sup> Tested in combination with hydrocortisone sodium succinate (Upjohn) 100 mg/L.

<sup>n</sup> Tested in combination with heparin sodium (Riker) 1000 units/L.

<sup>o</sup> Piperacillin component. Piperacillin in an 8:1 fixed-ratio concentration with tazobactam.

<sup>p</sup> Ceftolozane component. Ceftolozane in a 2:1 fixed-ratio concentration with tazobactam.

<sup>q</sup> Meropenem component. Meropenem in a 1:1 fixed-ratio concentration with vaborbactam.

<sup>r</sup> Test performed using the formulation WITH edetate disodium.

## Dexmedetomidine Hydrochloride

AHFS 28:24.92

### Products

Dexmedetomidine hydrochloride (Precedex, Hospira) is available as a concentrate for injection providing 100 mcg/mL of dexmedetomidine as the hydrochloride in single-use (preservative-free) 2-mL (200-mcg) vials.<sup>2848</sup> Each mL of the concentrate also contains sodium chloride 9 mg in water for injection.<sup>2848</sup>

Dexmedetomidine hydrochloride (Fresenius Kabi) also is available as a concentrate for injection providing 100 mcg/mL of dexmedetomidine as the hydrochloride in single-use (preservative-free) 2-mL (200-mcg) vials.<sup>3180</sup> Each mL of the concentrate also contains sodium acetate trihydrate 597 mcg, glacial acetic acid 27 mcg, and sodium chloride 9 mg in water for injection.<sup>3180</sup>

The concentrates for injection must be diluted in sodium chloride 0.9% prior to administration.<sup>2848 3180</sup> To prepare the required concentration solution for infusion (i.e., 4 mcg/mL), 2 mL of the concentrate should be added to 48 mL of sodium chloride 0.9% and shaken gently to mix.<sup>2848</sup>

Dexmedetomidine hydrochloride (Precedex, Hospira) also is available as a premixed, ready-to-use solution in sodium chloride 0.9% at a concentration of 4 mcg/mL in single-use 20-mL vials and 50- and 100-mL glass bottles for intravenous infusion.<sup>2848</sup> No further dilution of the ready-to-use solution is necessary.<sup>2848</sup>

Dexmedetomidine hydrochloride (HQ Specialty) also is available as a concentrate providing 100 mcg/mL of dexmedetomidine as the hydrochloride in multidose 4- and 10-mL vials.<sup>3179</sup> Each mL of the concentrate also contains methylparaben 1.6 mg, propylparaben 0.2 mg, and sodium chloride 9 mg in water for injection.<sup>3179</sup> The concentrate for injection must be diluted in sodium chloride 0.9% prior to administration.<sup>3179</sup> To prepare the required concentration solution for infusion (i.e., 4 mcg/mL), 2 or 4 mL of the concentrate should be added to 48 or 96 mL, respectively, of sodium chloride 0.9% and shaken gently to mix.<sup>3179</sup>

### Tonicity

Dexmedetomidine hydrochloride concentrates for injection and premixed, ready-to-use solution in sodium chloride 0.9% are isotonic.<sup>2848 3179 3180</sup>

### Equivalency

Dexmedetomidine hydrochloride 118 mcg is equivalent to 100 mcg of dexmedetomidine as the base.<sup>2848 3179 3180</sup>

### pH

Dexmedetomidine hydrochloride concentrates for injection in both single-use and multidose vials have a pH ranging from 4.5 to 7.<sup>2848 3179 3180</sup>

Dexmedetomidine hydrochloride premixed, ready-to-use solution in sodium chloride 0.9% has a pH ranging from 4.5 to 8.<sup>2848</sup>

### Trade Name(s)

Precedex

### Administration

Dexmedetomidine hydrochloride is administered by intravenous infusion using a controlled infusion device over periods not exceeding 24 hours.<sup>2848 3179 3180</sup> The concentrates for injection must be diluted in sodium chloride 0.9% to a concentration of 4 mcg/mL prior to administration,<sup>2848 3179 3180</sup> the premixed, ready-to-use solution does not require any further dilution.<sup>2848</sup>

### Stability

Dexmedetomidine hydrochloride concentrates for injection and premixed, ready-to-use solution should be clear and colorless.<sup>2848 3179 3180</sup> Intact single-use and multidose vials containing the concentrates for injection and single-use vials and glass bottles containing the drug diluted for intravenous infusion in sodium chloride 0.9% should be stored at controlled room temperature,<sup>2848 3179 3180</sup> consult specific labeling for additional storage details.

Dexmedetomidine hydrochloride solutions should be visually inspected for particulate matter and discoloration prior to administration.<sup>2848 3179 3180</sup>

Diluted solutions of dexmedetomidine hydrochloride (HQ Specialty) prepared from multidose vials of the concentrate for injection may be stored for up to 4 hours at room temperature or 24 hours at 2 to 8°C prior to administration.<sup>3179</sup> Any unused portion of the solution should be discarded.<sup>3179</sup>

### Syringes

The stability of dexmedetomidine hydrochloride concentrate (Hospira) after dilution to a concentration of 4 mcg/mL in sodium chloride 0.9% and packaged as 25 mL in 60-mL natural rubber-free polypropylene syringes (Becton Dickinson) was evaluated at ambient room temperature with light exposure and under refrigeration in the dark.<sup>2849</sup> No changes in color or clarity occurred.<sup>2849</sup> Samples stored at 20 to 25°C in light exhibited a loss of less than 10% over 48 hours; those stored at 5°C in the dark exhibited a loss of less than 5% over 14 days.<sup>2849</sup>

### Sorption

Dexmedetomidine hydrochloride is known to undergo sorption to some types of natural rubber.<sup>2848 3179 3180</sup> Although the drug is dosed to effect, the manufacturer recommends the use of administration equipment with synthetic rubber or coated natural rubber gaskets.<sup>2848 3179 3180</sup>

# Dexrazoxane Hydrochloride

**AHFS 92:56**

## Products

Dexrazoxane hydrochloride (Zinecard) is available as a lyophilized powder in single-dose vials containing the equivalent of 250 or 500 mg of dexrazoxane.<sup>3392</sup> Reconstitution of the contents of the 250- or 500-mg Zinecard vial with 25 or 50 mL, respectively, of sterile water for injection results in a solution with a dexrazoxane concentration of 10 mg/mL.<sup>3392</sup> The pH has been adjusted during manufacturing with hydrochloric acid.<sup>3392</sup> The reconstituted solution should be diluted in an infusion bag with Ringer's injection, lactated to a final dexrazoxane concentration of 1.3 to 3 mg/mL.<sup>3392</sup>

Dexrazoxane hydrochloride (generic; Mylan) also is available as a lyophilized powder in single-use vials containing the equivalent of 250 or 500 mg of dexrazoxane.<sup>3393</sup> Each vial is packaged with a 25- or 50-mL vial, respectively, of 0.167 M (i.e., 1/6 M) sodium lactate for use as a diluent for reconstituting the drug.<sup>3393</sup> Reconstitution of the contents of the 250- or 500-mg vials with 25 or 50 mL, respectively, of the provided diluent results in a solution with a dexrazoxane concentration of 10 mg/mL.<sup>3393</sup> The pH has been adjusted during manufacturing with hydrochloric acid.<sup>3393</sup> The reconstituted solution may be transferred to an empty infusion bag or may be diluted in an infusion bag with sodium chloride 0.9% or dextrose 5% to a final dexrazoxane concentration of 1.3 to 5 mg/mL.<sup>3393</sup>

Dexrazoxane hydrochloride (Totect) is available as a lyophilized powder in single-dose vials containing the equivalent of 500 mg of dexrazoxane.<sup>3394</sup> Reconstitution of the contents of the 500-mg Totect vial with 50 mL of 0.167 M sodium lactate results in a solution with a dexrazoxane concentration of 10 mg/mL.<sup>3394</sup> The resulting solution also contains hydrochloric acid, sodium hydroxide, and lactic acid in water for injection.<sup>3394</sup> The appropriate volume of the reconstituted solution should be diluted in 1 L of sodium chloride 0.9%.<sup>3394</sup>

## pH

The pH of reconstituted Zinecard solutions ranges from 1 to 3 while the pH of Zinecard diluted for infusion ranges from 3.5 to 5.5.<sup>3392</sup>

The pH of reconstituted solutions of dexrazoxane (generic; Mylan) ranges from 3.5 to 5.5.<sup>3393</sup>

## Trade Name(s)

Totect, Zinecard

## Administration

Diluted solutions of Zinecard for infusion should be administered by rapid intravenous drip infusion over 15 minutes.<sup>3392</sup>

The reconstituted solution of dexrazoxane (generic; Mylan) is administered by slow intravenous push; alternatively, the reconstituted solution may be diluted and administered by rapid intravenous drip infusion.<sup>3393</sup>

Diluted solutions of Totect for infusion should be administered by intravenous infusion over 1 to 2 hours at room temperature and under normal light conditions into a large caliber vein in an extremity or area other than the one affected by the anthracycline extravasation.<sup>3394</sup> Any cooling methods (e.g., ice packs) used for the extravasation being treated should be removed from the area at least 15 minutes prior to Totect administration.<sup>3394</sup>

As with other toxic drugs, caution should be exercised in the handling and preparation of dexrazoxane and applicable special handling and disposal procedures should be followed.<sup>3392 3393 3394</sup> Manufacturers recommend the use of gloves.<sup>3392 3393 3394</sup> If skin contact with the drug occurs, the affected area(s) should be washed immediately and thoroughly with soap and water.<sup>3392 3393 3394</sup>

## Stability

Intact vials of dexrazoxane should be stored at controlled room temperature.<sup>3392 3393 3394</sup> One manufacturer recommends that Totect vials remain in the original carton to protect from light.<sup>3394</sup>

Reconstituted solutions of Zinecard are stable for 30 minutes at room temperature or for up to 3 hours at 2 to 8°C.<sup>3392</sup> Diluted solutions of Zinecard for infusion are stable for 1 hour at room temperature or for up to 4 hours at 2 to 8°C.<sup>3392</sup>

The manufacturer states that reconstituted solutions of dexrazoxane (generic; Mylan) are stable for 6 hours from the time of reconstitution when stored in an empty infusion bag at controlled room temperature of 20 to 25°C or at 2 to 8°C; this preparation of dexrazoxane diluted for infusion in sodium chloride 0.9% or dextrose 5% is stable for 6 hours at 20 to 25°C or 2 to 8°C.<sup>3393</sup>

Reconstituted solutions of Totect should be diluted within 2 hours after reconstitution.<sup>3394</sup> Diluted solutions of Totect for infusion should be used immediately after preparation, but are stable for 4 hours from the time of preparation when stored below 25°C.<sup>3394</sup>

Solutions should be visually inspected for particulate matter and discoloration prior to administration; solutions containing a precipitate should be discarded.<sup>3392 3393 3394</sup> Any unused portions should be discarded.<sup>3392 3393 3394</sup>

In one study, reconstituted solutions of dexrazoxane (National Cancer Institute) 10 mg/mL were found to be stable for about 24 hours at 20 to 22°C exposed to or protected from fluorescent light; about 7% loss occurred when reconstituted with dextrose 5% and about 9% loss occurred when reconstituted with sodium chloride 0.9%.<sup>2395</sup> Refrigeration resulted in precipitation after 1 day.<sup>2395</sup>

In another study, reconstituted solutions of Zinecard 10 mg/mL prepared with sterile water for injection and dexrazoxane (generic; Mylan) prepared with 0.167 M sodium lactate were stable for

8 hours at room temperature; the reconstituted solutions exhibited a mean drug loss of 11 and 13%, respectively, at 24 hours.<sup>3395</sup>

### pH Effects

Dexrazoxane is most stable at acidic pH and is highly unstable in alkaline solutions.<sup>2395</sup> Dexrazoxane degrades rapidly at pH

values above 7;<sup>3392 3393</sup> more than 10% loss occurred in less than 2 hours at such pH values.<sup>2395</sup>

### Light Effects

No adverse effect on drug stability was found in 1- and 10-mg/mL solutions when exposed to fluorescent light.<sup>2395</sup>

## Compatibility Information

### Solution Compatibility

#### Dexrazoxane HCl

Test Soln Name	Mfr	Mfr	Conc/L or %	Remarks	Ref	C/I

## Dextran 40

AHFS 40:12

### Products

Dextran 40 products are available as 10% injections in dextrose 5% or sodium chloride 0.9% in 500-mL containers. The colloidal products contain low molecular weight dextran (average molecular weight of 40,000) with either dextrose, hydrous, 5 g/100 mL or sodium chloride 0.9 g/100 mL in water for injection.<sup>1(10/05) 4</sup>

### pH

The pH of dextran 40 10% in dextrose 5% ranges from 3 to 7. The pH of dextran 40 10% in sodium chloride 0.9% ranges from 3.5 to 7.<sup>1(10/05) 4</sup>

### Osmolarity

Dextran 40 10% in dextrose 5% has a calculated osmolarity of 255 mOsm/L. Dextran 40 10% in sodium chloride 0.9% has a calculated osmolarity of 310 mOsm/L.<sup>1(10/05)</sup>

### Sodium Content

Dextran 40 10% in sodium chloride 0.9% provides 77 mEq of sodium per 500-mL bottle.<sup>1(10/05) 4</sup>

### Trade Name(s)

LMD

### Administration

Dextran 40 10% injection is administered by intravenous infusion.<sup>1(10/05) 4</sup>

### Stability

Dextran 40 products should not be administered unless they are clear. Long periods of storage or exposure to temperature fluctuations may cause the formation of dextran flakes or crystals. Therefore, solutions should be stored at a constant temperature, preferably 25°C, and protected from freezing and extreme heat. Do not use dextran solutions that contain crystals.<sup>1(10/05)</sup> However, if flakes or crystals do appear, they can be dissolved by heating in a water bath at 100°C or autoclaving at 110°C for 15 minutes.<sup>4 1484 1485</sup> Because no antibacterial preservative is present, partially used containers should be discarded.<sup>4</sup>

# Diamorphine Hydrochloride

AHFS 28:08.08

## Diacetylmorphine HCl

### Products

Diamorphine hydrochloride is available as a lyophilized product in 10-, 30-, 100-, and 500-mg ampuls.<sup>38</sup>

Diamorphine hydrochloride is very soluble in water. Up to 100 mg can be reconstituted in 1 mL of diluent; a minimum of 2 mL of diluent is recommended for the 500-mg size. The preferred diluent is dextrose 5%, but sodium chloride 0.9% also may be used.<sup>1442</sup>

### Administration

Diamorphine hydrochloride is given by intramuscular, intravenous, or subcutaneous injection. Administration can also be by slow continuous subcutaneous or intravenous injection with an infusion control device.<sup>38</sup>

### Stability

Ampuls of lyophilized diamorphine hydrochloride should be stored at or below 25°C and protected from light.<sup>38</sup>

Diamorphine hydrochloride 1 mg/mL as an aqueous solution in flint glass ampuls stored at 25°C exhibited 10% loss in 50 days.<sup>1958</sup>

In another study, diamorphine hydrochloride up to 25 mg/mL in sterile water for injection was stable for up to 24 hours at ambient temperature when protected from light.<sup>1454</sup>

### pH Effects

The stability of the reconstituted injection depends on its pH; it is most stable at acidic pH, around 3.8 to 4.4<sup>1442</sup> to pH 4.5.<sup>1958</sup> Degradation increases greatly at neutral or basic pH.<sup>1448</sup>

Diamorphine hydrochloride exhibits a pH-dependent incompatibility in sodium chloride injection. To remain in solution, the pH must be below 6.<sup>1458</sup> Solutions containing up to 250 mg/mL of diamorphine hydrochloride have been shown to be compatible in sodium chloride 0.9%.<sup>1457 1458 1459</sup>

### Temperature Effects

Solutions of diamorphine hydrochloride in sterile water for injection at concentrations greater than 15 mg/mL exhibited precipitation when stored at 21 and 37°C for longer than two weeks. At concentrations of 1 to 250 mg/mL in sterile water for injection in glass containers, diamorphine hydrochloride was stable for eight weeks at -20°C, exhibiting less than 10% degradation. At 4°C, degradation was inversely related to concentration. Diamorphine hydrochloride 31 and 250 mg/mL was stable,

but solutions containing 1 and 7.81 mg/mL showed 15 and 12% losses, respectively, after eight weeks of storage.<sup>1452</sup>

### Syringes

The stability of diamorphine hydrochloride solutions containing 1 and 20 mg/mL in sodium chloride 0.9% in glass syringes was determined. At ambient temperature, diamorphine hydrochloride in glass syringes was stable for seven days at 1 mg/mL and for 12 days at 20 mg/mL. This was somewhat less than the drug's stability at these concentrations in PVC containers; adequate stability was maintained for at least 15 days in PVC containers.<sup>1449</sup>

Diamorphine hydrochloride stability in plastic syringes was reported to be 14 days at room temperature and greater than 40 days at 4°C.<sup>982</sup>

Diamorphine hydrochloride (Hillcross) 2 and 20 mg/mL in water for injection was stored in plastic syringes (Becton Dickinson) sealed with blind hubs. A 5% loss occurred in 18 days at 20°C.<sup>1672</sup>

### Infusion Pumps

Solutions containing diamorphine hydrochloride 250 mg/mL in an Act-a-Pump (Pharmacia) reservoir were stable for at least 14 days during simulated patient use.<sup>1450</sup> Degradation was both temperature and concentration dependent. Solutions of diamorphine hydrochloride 1 mg/mL in water stored at 21°C for 42 days showed 10.6% degradation. At 37°C, 32.6% degradation occurred.<sup>1451</sup>

However, at a concentration of 250 mg/mL, diamorphine hydrochloride losses of 11 and 85.8% at 21 and 37°C, respectively,<sup>1451</sup> were partially attributed to precipitation.<sup>1452</sup>

Diamorphine hydrochloride (Evans Medical) 5 mg/mL in sterile water for injection was stable in Parker Micropump PVC reservoirs for 14 days at 4°C, exhibiting no loss. At 37°C, about a 2% loss occurred in seven days and a 7% loss occurred in 14 days.<sup>1696</sup>

### Elastomeric Reservoir Pumps

Diamorphine hydrochloride 1 and 20 mg/mL in sodium chloride 0.9% was evaluated for stability in two elastomeric disposable infusion devices, Infusor (Travenol) and Intermate 200 (I.S.C.). The drug was stable for 15 days in most cases. However, solutions containing diamorphine hydrochloride 1 mg/mL in the Intermate reservoir stored at 31°C were only stable for two days.<sup>1449</sup>

## Diazepam

AHFS 28:24.08

### Products

Diazepam 5 mg/mL is available in 2-mL ampuls and vials, 10-mL vials, and 2-mL syringe cartridges. Each mL of solution also contains propylene glycol 40%, ethanol 10%, sodium benzoate and benzoic acid 5%, and benzyl alcohol 1.5%.<sup>1(1/08)</sup>

### pH

From 6.2 to 6.9.<sup>17</sup>

### Osmolality

The osmolality of diazepam (Roche) was determined to be 7775 mOsm/kg. Diazemuls (Kabi) has an osmolality of 349 mOsm/kg.<sup>1233</sup>

### Administration

Diazepam is administered by direct intravenous injection into a large vein<sup>1(1/08)</sup> <sup>4</sup> or, if necessary, into the tubing of a running infusion solution.<sup>4</sup> Extravasation should be avoided. It is recommended that the rate of administration in adults not exceed 5 mg/min; for children, it is recommended that the dose be administered over not less than 3 minutes. Diazepam can be given by deep intramuscular injection,<sup>1(1/08)</sup> <sup>4</sup> but this route may yield low or erratic plasma levels.<sup>4</sup> <sup>121</sup> <sup>638</sup> Intravenous infusion of diazepam diluted in infusion solutions has been performed but is not recommended.<sup>1(1/08)</sup> <sup>4</sup>

### Stability

The commercial product should be stored at controlled room temperature and protected from light.<sup>1(1/08)</sup>

The drug is most stable at pH 4 to 8 and is subject to acid-catalyzed hydrolysis below pH 3.<sup>643</sup>

In tropical climates, diazepam injection is subject to discoloration from degradation by an oxidative hydrolytic mechanism. The rate of degradation leading to discoloration is dependent on various factors including the polarity/dielectric constant of the vehicle, pH, oxygen and electrolyte content, access to light, and storage temperature.<sup>1749</sup>

Diazepam injection under simulated summer conditions in paramedic vehicles was exposed to temperatures ranging from 26 to 38°C over 4 weeks. Analysis found no loss of the drug under these conditions.<sup>2562</sup>

### Syringes

Diazepam 5 mg/mL was filled into 3-mL plastic syringes (Becton Dickinson, Sherwood Monoject, and Terumo) and stored at -20, 4, and 25°C in the dark. Losses, presumably due to sorption to surfaces and/or the elastomeric plunger seal, ranged from 6% at 25°C to 2 or 3% at 4°C to 1% or less at -20°C in 1 day. Storage for 7 days at 4°C and 30 days at -20°C resulted in losses of 4 to 8% and 5 to 13%, respectively.<sup>1562</sup>

Diazepam (Roche) 10 mg/2 mL stored in plastic syringes composed of polypropylene and polyethylene exhibited no loss of diazepam in 4 hours.<sup>351</sup>

Diazepam (Roche) 5 mg/mL was stored in 1.5-mL disposable glass syringes with slit rubber plunger-stoppers (Hy-Pod) for 90 days at 30 and 4°C in light-resistant bags. Diazepam was gradually lost from the solution, with the disappearance being essentially complete in 60 days. At 4°C, about 5% was lost at the 60- and 90-day intervals; about 9 to 10% was lost at 30°C in this period. The loss was attributed to sorption to the rubber plunger-stoppers.<sup>794</sup>

### Sorption

The stability of diazepam in several infusion fluids in glass containers<sup>321</sup> does not extend to the solutions in polyvinyl chloride (PVC) bags, in which substantial sorption occurs. At 10 mg in 100 and 200 mL, over 24% loss occurred in 30 minutes and 80 to 90% loss occurred in 24 hours.<sup>330</sup>

Diazepam 8 mg/L in sodium chloride 0.9% in PVC bags exhibited 20% loss in 24 hours and 32% loss in 1 week at 15 to 20°C due to sorption.<sup>536</sup>

The sorption of diazepam to PVC infusion bags was evaluated at concentrations of 5 and 20 mg/100 mL in dextrose 5% and sodium chloride 0.9%. Diazepam concentration was under 45% in 2 hours and 20 to 25% in 8 hours.<sup>647</sup>

Diazepam sorption that results from plastic infusion sets was evaluated. Dilutions of 7.5 and 30 mg in 150 mL of dextrose 5% and sodium chloride 0.9% were prepared in the burette chamber of a Buretrol. The solutions flowed through the tubing at 30 mL/hr for 2 hours. Less than 10% decrease in diazepam occurred in the burette chamber. However, running the solution through the tubing resulted in steep declines to 43% of the initial amount. When diazepam 25 and 100 mg/500 mL of dextrose 5% and sodium chloride 0.9% prepared in glass bottles and 100-mL aliquots were run through the Buretrol over 1 hour, only about 60 to 70% of the diazepam was delivered. The presence of a 0.5- $\mu$ m inline filter did not affect the concentration delivered.<sup>647</sup>

Over 90% loss due to sorption to the administration set (Abbott) and the extension tubing (Extracorporeal) both with and without a 0.22- $\mu$ m inline filter (Abbott) was reported. Diazepam 0.02 to 0.04 mg/mL in dextrose 5% had no precipitation, and solutions in glass bottles were stable over 24 hours. However, the amount delivered through the tubing was only 40 to 55% at time zero, and this amount dropped to 2 to 7% at 24 hours. No difference was noted from the inline filter.<sup>645</sup>

The sorption of diazepam to administration sets from solutions of diazepam 25 and 50 mg/500 mL in glass bottles of dextrose 5% and Ringer's injection, lactated or 12.5 and 25 mg/250 mL of these same solutions in Soluset burette chambers

was tested. The admixtures showed no evidence of physical incompatibility over 4 hours at room temperature. The solutions in glass bottles were run through Venosets composed of PVC drip chambers and tubing at 2.5 and 5 mg/hr. The solutions stored in the cellulose propionate burette chambers of the Solusets were also run through their PVC tubing at the same rates. The solution delivered through the Venosets contained about 91 to 97% of the initial concentration, with the more dilute solution having slightly more drug remaining. However, the Soluset delivered only about 50 to 60% in 2 hours and about 35 to 45% of the initial concentration after 4 hours. Most of the loss was due to sorption to the cellulose propionate burette chamber. This result was attributed to the larger surface area of the burette compared with the tubing and/or the difference in plastic composition. Almost all of the lost diazepam could be recovered through desorption from the burettes. The use of 0.45- $\mu$ m inline filters had no effect on the drug concentration.<sup>646</sup>

Diazepam 50-mg/500 mL solution in dextrose 5% prepared in glass bottles and run through an administration set (Travenol) at 100 mL/hr was assessed. Only 63% of the diazepam was initially delivered but gradually climbed to 81% at the end of 5 hours.<sup>649</sup>

A 27 to 33% diazepam loss was noted from admixtures in both dextrose 5% and sodium chloride 0.9% in PVC bags. Diazepam concentrations ranged from 0.05 to 0.2 mg/mL. No drug decomposition could be detected. Diazepam solutions in dextrose 5% were also run through a 70-inch Travenol set. A steep decline to under 70% was delivered during the first 15 minutes, after which the delivered amount increased to between 80 and 90% over the next 85 minutes as saturation of the tubing occurred. A quantitatively smaller, but qualitatively similar, effect was observed when diazepam was administered by intravenous push through an intravenous catheter (Abbott Venocath-18) of 11.5-inch total length. The decline in delivered diazepam reached a nadir of 95% in about 8 minutes before returning to 100% at 10 minutes. The smaller effect of the intravenous catheter relates to its relatively shorter length.<sup>650</sup>

Diazepam 8 mg/L in sodium chloride 0.9% in glass bottles exhibited a cumulative 7% loss due to sorption during a 7-hour simulated infusion through an infusion set (Travenol). The set consisted of a cellulose propionate burette chamber and 170 cm of PVC tubing. Diazepam sorption was attributed mainly to the tubing. The extent of sorption was found to be independent of concentration.<sup>606</sup>

Diazepam was also tested as a simulated infusion over at least 1 hour by a syringe pump system. A glass syringe on a syringe pump was fitted with 20 cm of polyethylene tubing or 50 cm of Silastic tubing. A negligible amount of drug was lost with the polyethylene tubing, but a cumulative loss of 21% occurred during the 1-hour infusion through the Silastic tubing.<sup>606</sup>

Storage of a 25-mL aliquot of the 8-mg/L diazepam solution in all-plastic syringes composed of polypropylene barrels and polyethylene plungers for 24 hours at room temperature in the dark did not result in any drug loss due to sorption.<sup>606</sup>

Diazepam 20 mg/500 mL in dextrose 5% was delivered at 4 mL/hr through PVC tubing by means of an infusion pump. Under

20% of the diazepam was delivered at any time point over 24 hours. Increasing the concentration to 50 mg/500 mL in dextrose 5% and increasing the infusion rate to 20 mL/hr decreased the amount of diazepam lost from the solution. After 30 minutes of solution delivery, the diazepam in the tubing effluent was about 30% of the initial concentration. Subsequently, the delivered diazepam concentration climbed to about 60% over 24 hours.<sup>351</sup>

The partition coefficients of diazepam with various plastics from intravenous containers and administration sets were determined. PVC bags and tubings from a variety of suppliers were all similar in partitioning and hundreds of times greater than polyolefin containers. Volume-control chambers made from cellulose propionate had partition coefficients smaller than those of PVC but still sufficient to cause serious depletion of diazepam from the chambers.<sup>644</sup>

The uptake of diazepam into PVC is absorption into the plastic matrix rather than adsorption to the surface. The absorption is independent of concentration but related to contact time with the plastic. Decreasing the flow rate or increasing the tubing length increases the amount of diazepam absorbed.

Increasing the flow rate from 10 to 264 mL/hr through 198 cm of PVC tubing decreased the amount of diazepam absorbed from 88 down to 28%. Increasing the tubing length from 100 to 350 cm increased the amount absorbed from 17 to 59%. However, it was noted that absorption is not markedly affected by tubing length within the range of lengths commercially available.<sup>644</sup>

Diazepam 50 mg/L in sodium chloride 0.9% in a glass bottle was delivered through a polyethylene administration set (Tridilset) over 8 hours at 15 to 20°C. The flow rate was 1 mL/min. No appreciable loss due to sorption occurred. This finding is in contrast to a 20% loss using a conventional administration set.<sup>769</sup>

The sorption of diazepam 40 and 120 mg/L in sodium chloride 0.9% was evaluated in 100- and 500-mL PVC infusion bags. After 8 hours at 20 to 24°C, 58 to 60% of the diazepam was lost in the 100-mL bag and 31% was lost in the 500-mL bag. The extent of sorption was independent of concentration but was influenced by the size of the PVC container. This difference results from the ratio of the surface area of plastic to the volume of solution. As the volume of solution in the bag decreases, the extent of sorption increases.<sup>770</sup>

Diazepam showed negligible (<3%) loss when aqueous solutions were stored in polypropylene bags.<sup>770</sup>

Extensive sorption of diazepam in dextrose 5% and sodium chloride 0.9% to PVC containers was found. Solutions of 10 to 80 mg/L showed a 12 to 20% diazepam loss in 1 hour. In 6 hours, the loss was 30% at 5°C and 40% at room temperature. Over 30% of the missing diazepam could be recovered by washing the PVC with methanol. Sorption did not occur to glass or polyethylene containers, which showed losses of about 6 to 8% in 24 hours.<sup>796</sup>

No loss of diazepam occurred to glass or polyethylene containers in 200-mg/L concentrations in dextrose 5% or sodium chloride 0.9%. In PVC containers, drug losses of 37 to 43% occurred in 24 hours at 25°C.<sup>797</sup>

Testing the administration of diazepam with a glass syringe on an infusion pump connected with high-density polyethylene tubing resulted in negligible drug loss.<sup>795</sup>

Plastic syringes having polypropylene barrels and polyethylene plungers (Pharma-Plast, AHS Australia) and all-glass containers were compared for the possible sorption of diazepam. After 24 hours of storage, no drug loss was found in either container. The authors indicated that these plastic syringes could be used with syringe pumps.<sup>782</sup>

The effect of several factors on the rate and extent of sorption of diazepam by PVC was evaluated. Sorption proved to be independent of changes in ethanol-propylene glycol concentrations in the vehicle, pH changes in the admixtures over 4.2 to 7.5, and the diazepam concentration. The rate and extent of sorption could be minimized by decreasing the storage temperature, minimizing the storage time, and increasing the surface area to volume ratio by storing the largest possible fluid volume in a given PVC bag and using short lengths of small diameter infusion tubing. Use of glass or polyolefin solution bottles and polyolefin infusion tubing avoids the loss of diazepam.<sup>880</sup>

The sorption of diazepam 20 mg/500 mL in sodium chloride 0.9%, run at 1 mL/min through PVC and polybutadiene (PBD) administration sets (Avon Medicals, U.K.), was reported. The delivered concentration through the PVC set was 80% initially and then climbed to 90% after 4 hours. For a concentration of 10 mg/120 mL prepared in a cellulose propionate burette, 10 to 15% sorption occurred in the burette. Use of the PBD set, with or without a methacrylate butadiene styrene burette chamber, resulted in no loss of diazepam.<sup>1027</sup>

The delivery of diazepam 50 and 100 mg/500 mL in dextrose 5% and sodium chloride 0.9% through a PVC administration set (Accuset 9210, IMED) and a set composed of ethylene vinyl acetate with a polyethylene inner wall (Accuset 9630, IMED) was evaluated. The solutions were run through the sets at 50 and 100 mL/hr. The delivered diazepam concentration varied between 44 and 71% at 50 mL/hr and between 62 and 89% at 100 mL/hr, increasing from the lower to the higher percentage over the 5-hour study period. The non-PVC set exhibited no sorption of diazepam, delivering 100% of the diazepam.<sup>1096</sup>

The percentage of diazepam delivered through PVC administration sets varied with the length of the tubing; the longer the tubing, the smaller was the percentage delivered. For a 25-mg/500 mL admixture in sodium chloride 0.9%, delivery through PVC tubing in lengths from 23 to 185 cm varied from 88% of the theoretical amount for the shortest length to 53% for the 185-cm length.<sup>1097</sup>

The effect of container type and flow rate on the sorption of diazepam was evaluated. Glass and polyethylene containers showed 0 and 5% sorption, respectively, of the diazepam content of a 25-mg/500 mL admixture in sodium chloride 0.9% in 7 days at 25°C. PVC containers showed a 75% loss in this time period. Simulated infusion of this solution from glass bottles through PVC sets at flow rates of 30 to 120 mL/hr showed that a greater percentage of diazepam was lost at the slower infusion rates. At 30 mL/hr, 63% was lost after 4 hours, while only 23% was lost after 4 hours at 120 mL/hr.<sup>1098</sup>

A rapid diazepam loss from a 40-mcg/mL solution in sodium chloride 0.9% in a PVC container at 21°C was reported. A 15% loss occurred in 2 hours, and a 55% loss occurred in 24 hours. Little or no diazepam loss occurred in 24 hours in glass bottles or polyethylene-lined laminated bags.<sup>1392</sup>

Diazepam 100 mcg/mL in sodium chloride 0.9% exhibited no loss due to sorption in 24 hours at 21°C in glass bottles and polypropylene trilayer bags (Softbag, Orion). However, about a 70% loss occurred due to sorption in PVC bags.<sup>1796</sup>

Diazepam 40 mcg/mL in 0.9% sodium chloride and in pH 7 buffer also underwent sorption to ethylene vinyl acetate (EVA) plastic bags. Losses exceeding 25% occurred within 24 hours stored at 30°C. The solutions appeared to reach equilibrium after 96 hours of storage.<sup>1917</sup>

Diazepam 0.04 mg/mL in dextrose 5% and sodium chloride 0.9% in PVC, polyethylene, and glass containers exhibited only 4 to 5% loss in glass and polyethylene containers but 66% loss due to sorption in PVC containers stored at 4 and 22°C for 24 hours.<sup>2289</sup>

To minimize the sorption of diazepam, glass or polyolefin containers should be used. If PVC bags are used, the lowest possible surface-to-volume ratio should be selected and storage time should be minimized. The use of non-PVC administration sets will reduce loss. If PVC tubing is used, it should be the shortest possible length with a small diameter, and the set should not contain a burette chamber. More rapid flow rates (consistent with safe clinical use) will also reduce the loss of diazepam.

### Filtration

Diazepam (Roche) 50 mcg/mL in dextrose 5% and sodium chloride 0.9% was delivered over 7 hours through 4 kinds of 0.2- $\mu$ m membrane filters varying in size and composition. Diazepam concentration losses of 7 to 17% were found during the first 60 minutes; subsequent diazepam levels returned to the original concentration when the binding sites became saturated.<sup>1399</sup>

<sup>g</sup> Tested in combination with heparin sodium (Riker) 1000 units/L.

<sup>h</sup> Test performed using the formulation WITH edetate disodium.

**Additional Compatibility Information****Infusion Solutions**

Although the package insert for diazepam contains a caveat against dilution of the product before intravenous administration,<sup>1(1/08)</sup> interest in the intravenous administration of diluted diazepam has been expressed repeatedly in the literature.

Roche indicated that an ampul of diazepam should be diluted in no more than 5 mL or, alternatively, all the way to 20 mL to avoid precipitation. Between these concentrations, a fine white precipitate may occur.<sup>379</sup>

Dilution of diazepam in a volume of 25% or more of the diazepam volume is stated to result in the immediate precipitation of diazepam. No precipitation was observed if aqueous dilution was made with a volume of less than 25% of the diazepam volume.<sup>2082</sup>

Diazepam injection added to sodium chloride 0.9% caused the immediate formation of a light yellow to white precipitate. The maximum dilution that produced such a precipitate was 15-fold, representing a mixture of about 0.3 to 0.4 mg/mL. Analysis of the diazepam injection–sodium chloride 0.9% precipitate showed that it was almost entirely diazepam. A precipitate also formed in human plasma. A solution composed of all ingredients of diazepam injection except diazepam was tried, but dilution yielded no precipitate. It was estimated that injection of 5 mg/min into the tubing of an intravenous infusion of sodium chloride 0.9% would result in a precipitate unless the solution rate exceeded 17 mL/min.<sup>381</sup>

It was determined that the precipitate induced by adding 2 mL of sterile water for injection to 1 mL of diazepam injection

is only diazepam. The precipitate appeared to be oily and adhered to the walls of the container, leaving a clear solution. This may explain the reports of the clearing of cloudy solutions with time.<sup>641 642</sup>

As little as 10 mg of diazepam in 100 mL of dextrose 5% resulted in a precipitate. It was also found that an infusion rate of over 15 to 20 mL/min was required to prevent precipitation of diazepam being injected at a rate of 5 mg/min in running infusions of dextrose 5% and sodium chloride 0.9%.<sup>382</sup>

Nevertheless, interest in infusing diazepam has persisted because of bioavailability problems associated with intramuscular injection<sup>121 383 384 638</sup> and a belief in the utility of diazepam infusions.<sup>386 387 388 389 390 391 392 1099</sup>

Diazepam 10 mg in 250 mL and 5 mg in 50 mL of sodium chloride 0.9% resulted in no observable precipitate.<sup>385</sup>

A transient cloudiness occurred when 100 mg of diazepam was added to 500 mL of Ringer's injection, lactated. The solution thereafter remained clear, and the clinical response to the diazepam infusion was good.<sup>392</sup>

A study was conducted on the compatibility and stability of diazepam in a variety of intravenous infusion solutions. Results indicate that a visible precipitate is produced in dilutions of 1:1 to 1:10. Haziness was reported at 1:15, and delayed precipitates forming after 6 to 8 hours were seen in some solutions at 1:20. Dilutions of 1:40 to 1:100 remained clear for 24 hours. Further, the concentration of the 1:40 to 1:100 dilutions was retained for 24 hours.<sup>321</sup>

The equilibrium solubilities of diazepam in water for injection, sodium chloride 0.9%, dextrose 5%, and Ringer's injection, lactated were determined. The equilibrium solubilities were

found to be about 0.04 to 0.05 mg/mL in all of the solutions at 25°C. This finding corroborated the work of others which indicated the solubility to be about 0.05 to 0.06 mg/mL. It was concluded that a more conservative 1:100 dilution should be used for diazepam infusion to guarantee solubility for 24 hours.<sup>643</sup>

The aqueous solubility of diazepam over a pH range of approximately 3 to 8 in phosphate buffer adjusted with hydrochloric acid or sodium hydroxide as well as dextrose 5%, sodium chloride 0.9%, and Ringer's injection, lactated was determined. In the pH range of 4 to 8, which included all 3 infusion solutions, the solubility was approximately 0.05 to 0.06 mg/mL at 25°C. Dilution to at least 0.04 mg/mL was recommended to ensure rapid and complete re-solution upon addition to the infusion solution.<sup>644</sup>

Various dilutions of diazepam in water for injection and sodium chloride 0.9% were tested. The observations are tabulated here:<sup>1095</sup>

Diazepam Concentration	Diluent	Observation
10 mg/5 mL	W, NS	Clear for 1 min but then precipitate forms
10 mg/10 mL	W, NS	Precipitates immediately

Diazepam Concentration	Diluent	Observation
10 mg/20 mL	NS	Precipitates immediately
10 mg/25 mL	NS	Precipitates immediately
10 mg/30 mL	NS	Clear for 30 min but then precipitate forms
10 mg/50 mL	NS	Clear for 10 days
10 mg/100 mL	NS	Clear for 10 days

### Order of Mixing

It has been reported that addition of diazepam to dextrose 5% and sodium chloride 0.9% to form concentrations of 50 and 200 mg/L results in an immediate and persistent yellow precipitate. However, addition of the diluent to the diazepam injection to these same concentrations results initially in a cloudy solution which clears before the completion of admixture. It was recommended that admixtures of diazepam be prepared by adding the infusion solution to the diazepam injection.<sup>647 648</sup>

## Diclofenac Sodium

AHFS 28:08.04.92

### Products

Diclofenac is available as 37.5-mg/mL solution of diclofenac as the sodium salt in single-use vials.<sup>2821</sup> Each mL of solution also contains hydroxypropyl-beta-cyclodextrin 333 mg and monothioglycerol 5 mg in water for injection with sodium hydroxide and/or hydrochloric acid for pH adjustment.<sup>2821</sup>

### Trade Name(s)

Dyloject

### Administration

Diclofenac sodium is administered by intravenous bolus injection over 15 seconds.<sup>2821</sup>

### Stability

Diclofenac sodium is a clear, colorless solution.<sup>2821</sup> Intact vials should be stored at controlled room temperature and protected from freezing and light.<sup>2821</sup>

© Copyright, September 2015. American Society of Health-System Pharmacists, Inc.

## Digoxin

AHFS 24:04.08

### Products

Digoxin is available in 1- and 2-mL ampuls and vials containing 0.25 mg/mL in propylene glycol 40% and alcohol 10%, along with sodium phosphate 0.17% and citric acid 0.08%.<sup>1(6/06)</sup>

Digoxin pediatric injection is available in 1-mL ampuls containing 0.1 mg/mL in propylene glycol 40% and alcohol 10%, along with sodium phosphate 0.17% and citric acid 0.08%.<sup>1(6/06)</sup>

### pH

From 6.8 to 7.2.<sup>1(6/06)</sup>

### Osmolality

The osmolality of digoxin pediatric injection (Burroughs Wellcome) was determined to be 9105 mOsm/kg by freezing-point depression and 5885 mOsm/kg by vapor pressure.<sup>1071</sup>

### Trade Name(s)

Lanoxin

### Administration

Digoxin is administered by direct intravenous injection slowly over a minimum of 5 minutes or longer given undiluted or diluted with a fourfold or greater volume of sterile water for injection, dextrose 5%, or sodium chloride 0.9%. If a tuberculin syringe is used for very small doses, the possibility of inadvertent overdosage exists. Following intravenous administration, the syringe should not be flushed with parenteral solution.<sup>1(6/06)</sup> <sup>4</sup> Deep intramuscular injection of not more than 2 mL at a single site followed by massage has been performed. However, it is painful and causes severe local irritation.<sup>4</sup>

### Stability

Intact containers of digoxin should be stored at controlled room temperature and protected from light.<sup>1(6/06)</sup>

### pH Effects

Digoxin is hydrolyzed in acidic solutions with a pH less than 3. At pH 5 to 8, however, digoxin is not hydrolyzed in aqueous solutions.<sup>798 799 800 801</sup>

### Plasticizer Leaching

Digoxin (Elkins-Sinn) 0.04 mg/mL in dextrose 5% did not leach diethylhexyl phthalate (DEHP) plasticizer from 50-mL polyvinyl chloride (PVC) bags in 24 hours at 24°C.<sup>1683</sup>

### Filtration

Digoxin (Burroughs Wellcome) 1 mg/L in dextrose 5%, sodium chloride 0.9%, and Ringer's injection, lactated filtered over 12 hours through a 5- $\mu$ m stainless steel depth filter (Argyle Filter Connector), a 0.22- $\mu$ m cellulose ester membrane filter (Ivex-2 Filter Set), and a 0.22- $\mu$ m polycarbonate membrane filter (In-Sure Filter Set), showed no significant reduction due to binding to the filters.<sup>320</sup>

In another evaluation, digoxin (Burroughs Wellcome) 3 mg/L in dextrose 5% and sodium chloride 0.9% did not display significant sorption to a 0.45- $\mu$ m cellulose membrane filter (Abbott S-A-I-F) during an 8-hour simulated infusion.<sup>567</sup>

Digoxin (Wellcome) 1 mcg/mL in dextrose 5% and sodium chloride 0.9% was delivered over 8 hours through 4 kinds of 0.2- $\mu$ m membrane filters varying in size and composition. In the first 20 minutes, digoxin concentration losses were 10 to 23% through the Sterifix filter and 24 to 32% through the Pall ELD-96LL filter. However, losses of 63 to 73% occurred in the first 20 minutes with the Ivex-HP and Pall FAE-020LL filters. Subsequent digoxin levels returned to the original concentration when the binding sites became saturated.<sup>1399</sup>

AHFS 24:28.92

## Products

Diltiazem hydrochloride is available as a 5-mg/mL solution in 5-mL (25-mg), 10-mL (50-mg), and 25-mL (125-mg) single-use vials.<sup>2875</sup> Also present in each mL of solution are citric acid hydrous 0.75 mg, sodium citrate dihydrate 0.65 mg, sorbitol solution 71.4 mg, and water for injection.<sup>2875</sup> Sodium hydroxide or hydrochloric acid is used to adjust the pH.<sup>2875</sup>

Diltiazem hydrochloride also is available as a lyophilized powder in 100-mg single-use ADD-Vantage vials.<sup>2876</sup> Each ADD-Vantage vial also contains mannitol base 75 mg.<sup>2876</sup> ADD-Vantage vials of diltiazem hydrochloride should be prepared with 100 mL of dextrose 5% or sodium chloride 0.9% in ADD-Vantage diluent bags.<sup>2876</sup>

## pH

From 3.7 to 4.1.<sup>2875</sup>

## Administration

Diltiazem hydrochloride in single-use vials is administered by direct intravenous injection over 2 minutes and by continuous intravenous infusion after dilution.<sup>2875</sup>

Following reconstitution using ADD-Vantage diluent bags, ADD-Vantage vials are intended for continuous intravenous infusion and should *not* be used for direct intravenous injection.<sup>2876</sup>

## Stability

Intact vials of the liquid injection should be stored under refrigeration and protected from freezing.<sup>2875</sup> Diltiazem hydrochloride may be stored for up to 1 month at room temperature but should then be destroyed.<sup>2875</sup>

Intact ADD-Vantage vials of diltiazem hydrochloride should be stored at controlled room temperature and protected from freezing.<sup>2876</sup> Reconstituted ADD-Vantage diltiazem hydrochloride injection is stable for 24 hours at controlled room temperature or under refrigeration.<sup>2876</sup>

## pH Effects

An increased rate of diltiazem hydrochloride hydrolysis occurs with increasing pH. Hydrolysis was lowest at pH 5 and 6 but increased substantially at pH 7 and 8. Diltiazem hydrochloride 100 mcg/mL in sodium chloride 0.9% with a pH between 5 and 6 exhibited no loss in 24 hours. Buffered to pH 7, losses of 3 to 4% in 24 hours were found.<sup>1915</sup>

## Light Effects

Diltiazem hydrochloride reconstituted with distilled water to a concentration of 10 mg/mL was exposed to UVA-UVB radiation with a solar simulator for 28 hours. Only 5.6% degradation occurred under this intense light exposure. The drug maintained adequate stability and light protection was not required.<sup>2432</sup>

## Freezing Solutions

Diltiazem hydrochloride (Baxter) 1 mg/mL in dextrose 5% was stored in polyolefin bags and frozen at  $-20^{\circ}\text{C}$ .<sup>2874</sup> The solution was physically stable and demonstrated less than 3% loss after 30 days of storage followed by warming to room temperature.<sup>2874</sup>

## Sorption

A pH-dependent loss of diltiazem hydrochloride occurs due to sorption to polyvinyl chloride (PVC) containers and administration sets. Diltiazem hydrochloride 100 mcg/mL in sodium chloride 0.9% buffered to neutrality exhibits a loss of 11% in 24 hours in PVC containers but only 3 to 4% in glass and polypropylene containers. Similar results were found with PVC administration sets. Buffered to pH 8, diltiazem hydrochloride concentration was initially reduced to about 83% when delivered at 0.52 mL/min through a 100-cm PVC administration set. At pH 6 and 7, initial losses were much less, about 1 and 5%, respectively. Delivered diltiazem hydrochloride returned to full concentration in less than 1 hour at pH 6 and 7 but at pH 8 was only about 93% in 2 hours.<sup>1915</sup>

Diltiazem hydrochloride 0.05 mg/mL in dextrose 5% and sodium chloride 0.9% packaged in PVC, polyethylene, and glass containers exhibited little or no loss due to sorption to any of the container types when stored at 4 and  $22^{\circ}\text{C}$  for 24 hours protected from light.<sup>2289</sup>

Diltiazem hydrochloride (Synthelabo) 1 g/L in dextrose 5% and in sodium chloride 0.9% was evaluated for loss due to sorption to a variety of polymer container types compared to glass containers. No significant loss due to sorption was found at  $21^{\circ}\text{C}$  after 48 hours of contact time to PVC and polyethylene containers and 24 hours of contact time to polyamide containers.<sup>274</sup>

Similarly, no significant loss of diltiazem hydrochloride occurred from 1-g/L solutions in dextrose 5% and in sodium chloride 0.9% in cellulose propionate (Abbott), butadiene styrene (B. Braun), and metacrylate butadiene styrene (Avon) burettes for 24 hours at  $21^{\circ}\text{C}$  and when delivered over 5 hours through PVC (Abbott and Baxter), PVC/polyethylene double polymer (Abbott), and polybutadiene (Avon) administration tubing.<sup>274</sup>

## Filtration

Cellulose ester filters (B. Braun and Millipore) were found to result in a temporary reduction in the concentration of delivered diltiazem hydrochloride from a 1-g/L solution in sodium chloride 0.9%. The concentration of delivered diltiazem hydrochloride returned to near 100% after about 1 to 2 hours of infusion through the filter. No reduction in delivered concentration was found if dextrose 5% was used as the vehicle. No loss occurred in either infusion solution with polyamide (Pall) filters.<sup>274</sup>

## Compatibility Information

## Dimenhydrinate

AHFS 56:22.08

### Products

Dimenhydrinate is available in 1-mL and 10-mL vials containing dimenhydrinate 50 mg/mL in propylene glycol 50% and water. Sodium hydroxide and/or hydrochloric acid may be used to adjust the pH and benzyl alcohol is present in multiple-dose vials as a preservative. Dimenhydrinate contains 53 to 55.5% of diphenhydramine and 44 to 47% of 8-chlorotheophylline.<sup>1(6/06) 4</sup>

### pH

From 6.4 to 7.2.<sup>1(6/06) 4</sup>

### Administration

Dimenhydrinate is administered by intramuscular injection or by intravenous injection over 2 minutes after dilution with 10 mL of sodium chloride 0.9%.<sup>1(6/06) 4</sup>

### Stability

Intact containers should be stored at controlled room temperature and protected from freezing.<sup>1(6/06) 4</sup>

### pH Effects

A test of dimenhydrinate solutions at pH 2 to 10 showed no separation or precipitation at pH 5.4 to 8.6 on extended room temperature storage. Below pH 5.4, a white powdery precipitate of 8-chlorotheophylline formed within 24 hours. Above pH 8.6, an oily liquid separated within 30 minutes.<sup>279</sup>

# Diphenhydramine Hydrochloride

AHFS 4:04

## Products

Diphenhydramine hydrochloride is available as a 50-mg/mL solution in 1-mL vials and disposable syringes. Also present in the vials is 0.1 mg/mL of benzethonium chloride. The pH may have been adjusted with sodium hydroxide or hydrochloric acid.<sup>1(1/08)</sup>

## pH

From 4 to 6.5.<sup>17</sup>

## Trade Name(s)

Benadryl

## Administration

Diphenhydramine hydrochloride is administered by deep intramuscular injection, slow direct intravenous injection, or continuous or intermittent intravenous infusion.<sup>1(1/08)</sup> <sup>4</sup> Subcutaneous or perivascular injection should be avoided due to irritation.<sup>4</sup>

## Stability

Diphenhydramine hydrochloride in intact containers should be stored in light-resistant containers at controlled room temperature. Freezing should be avoided.<sup>1(1/08)</sup> <sup>4</sup>

Diphenhydramine hydrochloride under simulated summer conditions in paramedic vehicles was exposed to temperatures ranging from 26 to 38°C over 4 weeks. Analysis found no loss of the drug under these conditions.<sup>2562</sup>

## Central Venous Catheter

Diphenhydramine hydrochloride (Schein) 2 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

# Dobutamine Hydrochloride

**AHFS 12:12.08.08**

## Products

Dobutamine hydrochloride is available in 20-, 40-, and 100-mL single-dose vials as a concentrate for injection. Each mL contains 12.5 mg of dobutamine (as the hydrochloride), sodium bisulfite 0.24 mg, and hydrochloric acid and/or sodium hydroxide to adjust the pH. Dobutamine hydrochloride concentrate for injection must be diluted further to a concentration not greater than 5 mg/mL before administration.<sup>1(1/07) 4</sup>

Dobutamine hydrochloride also is available in plastic bags as premixed solutions in concentrations of 1, 2, and 4 mg/mL in dextrose 5%. Sodium metabisulfite and edetate disodium dihydrate also may be present.<sup>4</sup>

## pH

From 2.5 to 5.5.<sup>1(1/07) 4 17</sup> The premixed infusion solutions in dextrose 5% have a pH ranging from 2.5 to 5.5.<sup>4</sup>

## Osmolality

The osmolality of dobutamine hydrochloride injection (Lilly) was determined to be 273 mOsm/kg by freezing-point depression and vapor pressure.<sup>1071</sup> At a concentration of 5 mg/mL (manufacturer and diluent unspecified), the osmolality was determined to be 361 mOsm/kg by freezing-point depression.<sup>1233</sup>

The premixed infusion solutions in dextrose 5% have osmolalities ranging from 260 to 284 mOsm/kg for the 4 concentrations available.<sup>4</sup>

## Administration

Dobutamine hydrochloride is administered by intravenous infusion after dilution to a concentration no greater than 5 mg/mL. The concentration used is dependent on the patient's dosage and fluid requirements. An infusion pump or other infusion control device should be used to control the flow rate.<sup>1(1/07) 4</sup>

## Stability

Intact containers should be stored at controlled room temperature and protected from excessive heat and freezing. Solutions that are further diluted for intravenous infusion should be used within 24 hours.<sup>1(1/07) 4</sup>

Dobutamine hydrochloride concentrate for injection is a clear, colorless to pale straw-colored solution. Solutions of dobutamine hydrochloride may have a pink discoloration. This discoloration, which will increase with time, results from a slight oxidation of the drug. However, there is no significant loss of drug within the recommended storage times for solutions of the drug.<sup>4</sup>

Dobutamine hydrochloride has been stated to be incompatible with alkaline solutions.<sup>1(1/07) 4</sup>

## Syringes

Dobutamine hydrochloride (Lilly) 250 mg/50 mL in dextrose 5% exhibited no change in appearance and no drug loss when

stored in 60-mL plastic syringes (Becton Dickinson) for 24 hours at 25°C.<sup>1579</sup>

Dobutamine hydrochloride (Lilly) 5 mg/mL in dextrose 5% was packaged in 50-mL polypropylene syringes (Becton Dickinson) and stored at 4 and 24°C in the dark and exposed to room light for 48 hours. Dobutamine losses were less than 10% throughout the study.<sup>1961</sup>

To assess the stability of dobutamine 500 mg in 50-mL syringes, dobutamine hydrochloride (Phoenix) 12.5-mg/mL concentrate for injection was mixed with dextrose 5% for final dobutamine and dextrose concentrations of 10 mg/mL and 1%, respectively, and packaged as 3 mL in 50-mL syringes (Becton Dickinson).<sup>3511</sup> Syringes were stored at 4 and 40°C protected from light and at room temperature, both protected from and exposed to light.<sup>3511</sup> Calculated times to 5% loss from initial concentrations were approximately 111, 74, 56, and 45 days for samples stored at 4°C protected from light, room temperature protected from light, room temperature exposed to light, and 40°C protected from light, respectively.<sup>3511</sup> However, syringes stored at room temperature protected from light, 40°C protected from light, and room temperature exposed to light demonstrated discoloration at 42, 35, and 28 days, respectively; syringes stored at 4°C protected from light did not demonstrate any such discoloration.<sup>3511</sup> While all samples demonstrated less than 10% loss from initial concentrations in 42 days, the authors concluded that syringes stored at 4°C protected from light and room temperature protected from light have a shelf life of 42 and 35 days, respectively.<sup>3511</sup>

## Sorption

Delivering dobutamine hydrochloride (Lilly) 5 mg/mL in dextrose 5% by syringe pump over 12 hours at 24°C through polyvinyl chloride (PVC) and polyethylene tubing did not result in substantial dobutamine losses.<sup>1961</sup>

## Filtration

Dobutamine hydrochloride (Lilly) 0.5 mg/mL in dextrose 5% and sodium chloride 0.9% was filtered through a 0.22- $\mu$ m cellulose ester membrane filter (Ivex-HP, Millipore) over 6 hours. No significant drug loss due to binding to the filter was noted.<sup>1034</sup>

## Central Venous Catheter

Dobutamine hydrochloride (Astra) 4 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

## Compatibility Information

Zidovudine	BW	4 mg/mL <sup>a</sup>	LI	5 mg/mL <sup>a</sup>	Physically compatible for 4 hr at 25°C	1193	C

<sup>a</sup> Tested in dextrose 5%.

<sup>b</sup> Tested in sodium chloride 0.9%.

<sup>c</sup> Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>d</sup> Tested in sterile water for injection.

<sup>e</sup> Tested in bacteriostatic sodium chloride 0.9% preserved with benzyl alcohol 0.9%.

<sup>f</sup> Tested as the premixed infusion solution.

<sup>g</sup> Lyophilized formulation tested.

<sup>h</sup> Refer to Appendix for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>i</sup> Run at 10 mL/hr.

<sup>j</sup> In dextrose 5% infused at 1.2 mL/hr.

<sup>k</sup> Tested in dextrose 5% in sodium chloride 0.45%.

<sup>l</sup> Tested in Ringer's injection, lactated.

<sup>m</sup> Nesiritide is incompatible with bisulfite antioxidants used in some drug formulations. The specific formulation of the product to be used should be checked to assure that no sulfite antioxidants are present.

<sup>n</sup> Test performed using the formulation WITHOUT edetate disodium.

<sup>o</sup> Tested in either dextrose 5% or in sodium chloride 0.9%, but the report did not specify which solution.

<sup>p</sup> Tested in a 1:1 mixture of (1) dextrose 5% and dextrose 5% in sodium chloride 0.45% with and without potassium chloride 20 mEq/L and also in (2) dextrose 10% in sodium chloride 0.45% with and without potassium chloride 20 mEq/L.

<sup>q</sup> Tested in a 1:1 mixture of dextrose 5% and TPN #274 (see Appendix).

<sup>r</sup> Piperacillin component. Piperacillin in an 8:1 fixed-ratio concentration with tazobactam.

<sup>s</sup> Salt not specified.

<sup>t</sup> Quinupristin and dalfopristin components combined.

<sup>u</sup> Ceftolozane component. Ceftolozane in a 2:1 fixed-ratio concentration with tazobactam.

<sup>v</sup> Meropenem component. Meropenem in a 1:1 fixed-ratio concentration with vaborbactam.

<sup>w</sup> Test performed using the formulation WITH edetate disodium.

**Additional Compatibility Information*****Peritoneal Dialysis Solutions***

Dobutamine hydrochloride (Lilly) 2.5, 5, and 7.5 mcg/mL in Dianeal PD-1 (Baxter) with dextrose 1.5 and 4.25% retained at least 90% when stored for 24 hours at 4, 26, and 37°C.<sup>1417 1702</sup>

## Docetaxel

### AHFS 10:00

#### Products

Several different formulations of docetaxel injection products are available.<sup>3012 3013 3014 3015 3099</sup> **CAUTION: Care should be taken to ensure that the correct drug product, dose, and preparation procedure are used and that no confusion among differing products and concentrations occurs.**

The use of gloves during preparation of docetaxel doses is recommended.<sup>3012 3013 3014 3015 3099</sup> If docetaxel concentrate, powder, or any reconstituted or diluted solution comes in contact with skin, the affected area should be washed thoroughly with soap and water.<sup>3012 3013 3014 3015 3099</sup> If contact with mucosa occurs, thorough flushing with water is required.<sup>3012 3013 3014 3015 3099</sup>

*Docetaxel concentrate with diluent (2-vial package).* Docetaxel concentrate is available in a 2-vial package: the first vial contains docetaxel concentrate 0.5 mL (20 mg) or 2 mL (80 mg), while the second vial contains 1.95 or 7.2 mL, respectively, of the special diluent.<sup>3014</sup> Each mL of docetaxel concentrate in the first vial contains docetaxel (anhydrous) 40 mg, polysorbate 80 1040 mg, and dehydrated alcohol 60 mg.<sup>3014</sup> Citric acid anhydrous also may have been added to adjust the pH.<sup>3014</sup> The diluent vial contains the special diluent, which is composed of polyethylene glycol 400 13% (w/v) in water for injection.<sup>3014</sup> Both the docetaxel vials and the accompanying diluent vials contain an overfill.<sup>3014</sup>

Preparation of the final diluted solution for infusion from this 2-vial formulation requires a 2-step dilution procedure prior to administration.<sup>3014</sup> Step 1 is the preparation of the *initial* diluted solution, which is then further diluted to the *final* diluted solution for infusion in step 2.<sup>3014</sup>

To prepare the initial diluted solution (step 1), the vial of accompanying diluent should be partially inverted to withdraw the entire contents (approximately 1.95 mL for docetaxel 20 mg and approximately 7.2 mL for docetaxel 80 mg) and the contents should be added to the appropriate corresponding vial of docetaxel concentrate.<sup>3014</sup> Using repeated inversions, each vial of diluted docetaxel concentrate should then be thoroughly mixed for about 45 seconds; vials should not be shaken.<sup>3014</sup> This initial diluted solution is a clear solution having a docetaxel concentration of 10 mg/mL.<sup>3014</sup> If foam appears on the surface of the solution from the surfactant (i.e., polysorbate 80) in the formulation, the vials should be allowed to stand until any foam has dissipated; however, it is not necessary for all of the foam to have dissipated before proceeding with the rest of the preparation steps.<sup>3014</sup>

To prepare the final diluted solution (step 2), the appropriate dose of the docetaxel 10-mg/mL initial diluted solution should be withdrawn from the vial and added to 250 mL of sodium chloride 0.9% or dextrose 5% in a glass or plastic (e.g., polypropylene, polyolefin) infusion container to produce a final diluted solution for infusion with a concentration of 0.3 to 0.74 mg/mL.<sup>3014</sup> For docetaxel doses exceeding 200 mg, a larger volume

of infusion solution should be used so that the concentration of the final diluted solution for infusion does not exceed 0.74 mg/mL.<sup>3014</sup> The final diluted solution for infusion should be thoroughly mixed by rotation.<sup>3014</sup>

The manufacturer cautions that the 2-vial and 1-vial formulations of docetaxel concentrate should not be used together.<sup>3014</sup>

*Docetaxel concentrate (1-vial package).* Docetaxel also is available in single-use and multidose 1-vial formulations as concentrates of either 10<sup>3013</sup> or 20 mg/mL<sup>3012 3014</sup> in polysorbate 80 and dehydrated alcohol.<sup>3012 3013 3014</sup> Anhydrous citric acid,<sup>3013 3014</sup> polyethylene glycol,<sup>3013</sup> propylene glycol,<sup>3016</sup> edetate disodium,<sup>3016</sup> and povidone<sup>3018</sup> also may be present in some products; specific product labeling should be consulted for additional formulation details.<sup>3012 3013 3014 3016 3018</sup> These concentrates do not require a 2-step dilution process; instead, these concentrates may be added directly to an infusion solution as a single step.<sup>3012 3013 3014</sup>

Manufacturer recommendations differ on storage of the various 1-vial formulations;<sup>3012 3013 3014</sup> if stored under refrigeration, the appropriate number of vials should be allowed to stand at room temperature for approximately 5 minutes prior to use.<sup>3012</sup> The appropriate dose of the docetaxel concentrate should be withdrawn from the vials using *only* a 21-gauge needle;<sup>3012 3013 3014</sup> larger bore needles (e.g., 18- or 19-gauge) may result in coring of the stopper and the presence of rubber particulates.<sup>3012 3014</sup> The dose should be added to 250 mL of sodium chloride 0.9% or dextrose 5% in a glass or plastic (e.g., polypropylene, polyolefin) infusion container to produce a diluted solution for infusion with a docetaxel concentration of 0.3 to 0.74 mg/mL.<sup>3012 3013 3014</sup> For docetaxel doses exceeding 200 mg, a larger volume of infusion solution should be used so that the concentration of the diluted solution for infusion does not exceed 0.74 mg/mL.<sup>3012 3013 3014</sup> The diluted solution for infusion should be thoroughly mixed by gentle manual rotation.<sup>3012 3013 3014</sup>

*Docetaxel alcohol-free concentrate (1-vial package).* An alcohol-free 1-vial formulation of docetaxel 20 mg/mL concentrate also is available for dilution as a single step.<sup>3099</sup> This formulation is available in 1-mL (20 mg) single-dose vials and 4-mL (80 mg) and 8-mL (160 mg) multidose vials.<sup>3099</sup> Each mL contains docetaxel (anhydrous) 20 mg, soybean oil 27.5 mg, polysorbate 80 585 mg, citric acid 10 mg, and polyethylene glycol 300 442.2 mg.<sup>3099</sup> The appropriate dose of the docetaxel injection should be withdrawn from the vials using a 20-gauge needle and transferred to 250 mL of sodium chloride 0.9% or dextrose 5% in a glass or plastic (e.g., polypropylene, polyolefin) infusion container in a single injection to produce a diluted solution for infusion with a concentration of 0.3 to 0.74 mg/mL.<sup>3099</sup> For docetaxel doses exceeding 200 mg, a larger volume of infusion solution should be used so that the concentration of the diluted solution for infusion does not exceed 0.74 mg/mL.<sup>3099</sup> The diluted solution for infusion should be thoroughly mixed by gentle manual rotation.<sup>3099</sup>

*Docetaxel lyophilized powder with diluent (2-vial package).* Docetaxel also is available as a lyophilized powder in a single-use vial containing 20 or 80 mg of docetaxel (anhydrous) packaged with a diluent vial containing approximately 1 or 4 mL of diluent (ethanol 35.4% [w/w] in polysorbate 80).<sup>3015</sup> Both the docetaxel vials and the accompanying diluent vials contain a slight overfill.<sup>3015</sup>

To prepare the solution for infusion, the appropriate number of vials of powder and accompanying diluent should be allowed to stand at room temperature for approximately 5 minutes prior to use.<sup>3015</sup> The diluent vials should be partially inverted to withdraw the diluent using an 18- to 21-gauge, 1½-inch needle.<sup>3015</sup> The diluent should be transferred to the powder vial, and the vial should be shaken well to completely dissolve the powder.<sup>3015</sup> The 20-mg vial should be reconstituted with 1 mL of the accompanying diluent to yield a solution containing 20 mg/0.8 mL (equivalent to 25 mg/mL); the 80-mg vial should be reconstituted with 4 mL of the accompanying diluent to yield a solution with a concentration of 24 mg/mL.<sup>3015</sup> If bubbles appear in the solution from the surfactant (i.e., polysorbate 80) in the formulation, the vials should be allowed to stand until any bubbles have dissipated.<sup>3015</sup>

The appropriate dose of the docetaxel reconstituted solution should be withdrawn from the vial and added to 250 mL of sodium chloride 0.9% or dextrose 5% in a glass or plastic (e.g., polypropylene, polyolefin) infusion container to produce a final diluted solution for infusion with a concentration of 0.3 to 0.74 mg/mL.<sup>3015</sup> For docetaxel doses exceeding 200 mg, a larger volume of infusion solution should be used so that the concentration of the final diluted solution for infusion does not exceed 0.74 mg/mL.<sup>3015</sup> The final diluted solution for infusion should be thoroughly mixed by manual rotation.<sup>3015</sup>

### Alcohol Content

Docetaxel injection products differ in the amount of alcohol (ethanol) present in the formulation:<sup>3012 3013 3014 3015 3019 3025 3099</sup>

Manufacturer	Formulation	Alcohol (ethanol) Content (g/m <sup>2</sup> ) per Docetaxel 100 mg/m <sup>2</sup> dose	Ref
Accord	1-vial concentrate	1.975	3014
Accord	2-vial concentrate	0.15	3014
Actavis	1-vial concentrate	2	3018
Eagle	Alcohol-free concentrate	0	3099
Hospira	1-vial concentrate	1.8	3013
Pfizer	1-vial concentrate	3.2	3016
Sandoz	1-vial concentrate	2.6	3017
Sanofi-Aventis	1-vial concentrate	2	3012
Sun Pharma Global	Lyophilized powder	1.425	3015

The manufacturers and FDA state that consideration should be given to the alcohol content of docetaxel injection products when prescribing or administering the drug, especially in patients in whom alcohol intake should be avoided or

minimized<sup>3012 3013 3014 3015 3019</sup> or when used in conjunction with other medications.<sup>3019</sup>

### Trade Name(s)

Docefrez, Taxotere

### Administration

Docetaxel is administered as a 1-hour intravenous infusion at ambient temperature and light to patients who have been adequately premedicated to control adverse effects.<sup>3012 3013 3014 3015</sup> To minimize patient exposure to the diethylhexyl phthalate (DEHP) plasticizer, the infusion solution should be infused using polyethylene-lined administration sets.<sup>3012 3013 3014 3015 3099</sup>

### Stability

All diluted docetaxel solutions for infusion should be visually inspected for particulate matter and discoloration prior to administration; any solution that is not clear or that appears to contain a precipitate should be discarded.<sup>3012 3013 3014 3015</sup>

*Docetaxel concentrate with diluent (2-vial package)* is a viscous clear yellow to brownish-yellow solution.<sup>3014</sup> Intact vials of docetaxel with the accompanying special diluent should be stored at controlled room temperature and protected from light.<sup>3014</sup>

The manufacturer states that the *initial* diluted solution is stable for up to 8 hours after preparation when stored under refrigeration or at room temperature.<sup>3014</sup> Thiesen and Kramer evaluated the stability of docetaxel 10-mg/mL initial diluted solution over 28 days at 25 and 4°C.<sup>2242</sup> The initial diluted solution remained visually clear with no color change and no docetaxel loss at either temperature.<sup>2242</sup>

The manufacturer states that the *final* diluted solution for infusion is stable for 4 hours, including the 1-hour infusion time, if stored between 2 and 25°C.<sup>3014</sup>

*Docetaxel concentrate (1-vial package)* formulations vary in color from clear, colorless to pale yellow to brownish-yellow.<sup>3012 3013 3014 3016 3017 3018</sup> Recommended storage conditions of intact vials also vary; however, most products should be stored between 2 and 25°C in the original container to protect from light.<sup>3012 3013 3014 3016 3017 3018</sup> Freezing of the docetaxel concentrate vials does not adversely affect most 1-vial concentrate products.<sup>3012 3013 3014 3016 3017</sup> Multidose vials are stable for up to 28 days from initial vial puncture; however, temperature storage requirements and light protection recommendations during that time vary among products.<sup>3013 3014 3016 3017</sup> Specific product labeling should be consulted for additional storage and stability details.

The diluted solution prepared from docetaxel concentrate (Taxotere, Sanofi-Aventis) is stable for up to 6 hours, including the 1-hour infusion time, if stored between 2 and 25°C;<sup>3012</sup> diluted solutions prepared from some generic 1-vial concentrate products have been described as stable for up to 4 hours under the same conditions.<sup>3013 3014 3016 3017 3018</sup> In addition, the physical and chemical stability of the diluted solution for infusion in non-polyvinyl chloride (non-PVC) bags has been demonstrated for up to 48 hours for solutions prepared as recommended and

stored at 2 to 8°C for certain products.<sup>3012</sup> Specific product labeling should be consulted for additional stability details.

*Docetaxel alcohol-free concentrate (1-vial package)* is a clear, colorless to yellow viscous solution.<sup>3099</sup> Intact vials of the drug should be stored at 20 to 25°C in the original package to protect from light.<sup>3099</sup> Following dilution of the alcohol-free formulation in sodium chloride 0.9% or dextrose 5% for infusion, the solution is stable for 24 hours if stored between 2 and 25°C.<sup>3099</sup> Multidose vials are stable for up to 28 days from initial vial puncture with multiple needle entries and withdrawals when stored at 2 to 8°C and protected from light.<sup>3099</sup>

*Docetaxel lyophilized powder with diluent (2-vial package)* is a white powder that forms a clear solution when reconstituted.<sup>3015</sup> Intact vials of the drug and accompanying diluent should be stored at 2 to 8°C in the original package to protect against bright light.<sup>3015</sup> The manufacturer states that the reconstituted solution is stable for up to 8 hours after preparation when stored under refrigeration or at room temperature.<sup>3015</sup> The final diluted solution for infusion is stable for 6 hours, including the 1-hour infusion time, if stored between 2 and 25°C.<sup>3015</sup> Physical and chemical stability of the final diluted solution for infusion in non-PVC bags also has been demonstrated for up to 48 hours for solutions prepared as recommended and stored at 2 to 8°C.<sup>3015</sup>

Docetaxel 0.8 mg/mL in sodium chloride 0.9% did not exhibit an antimicrobial effect on *Enterococcus faecium*, *Staphylococcus aureus*, *Pseudomonas aeruginosa*, and *Candida albicans* inoculated into the solution. Diluted solutions should be stored under refrigeration whenever possible, and the potential for microbiological growth should be considered when assigning expiration periods.<sup>2160</sup>

### Freezing Solutions

Although freezing is not noted to adversely affect most 1-vial docetaxel concentrate products,<sup>3012 3013 3014 3016</sup> one manufacturer states that the diluted docetaxel solution for infusion should not be frozen.<sup>3017</sup>

### Crystallization

Some docetaxel products are supersaturated and may crystallize over time.<sup>3012 3015 3016</sup> If crystallization is noted, the drug must no longer be used and should be discarded.<sup>3012 3015 3016</sup>

### Plasticizer Leaching

The surfactant (polysorbate 80) contained in docetaxel formulations can leach plasticizer from DEHP-plasticized PVC containers and administration sets.<sup>1683</sup> The amount of DEHP plasticizer leached is time and concentration dependent;<sup>1683</sup> it is also a function of the lipophilicity of the fluid that comes into contact with the DEHP-plasticized PVC container or device.<sup>3100</sup> The manufacturers recommend that docetaxel not be allowed to contact such containers and equipment.<sup>3012 3013 3014 3015 3099</sup> To minimize patient exposure to the plasticizer, the infusion solution should be stored in glass or plastic (e.g., polyolefin, polypropylene) containers and infused using polyethylene-lined administration sets.<sup>3012 3013 3014 3015 3099</sup>

In 1996, an acceptability limit of no more than 5 parts per million (5 mcg/mL) for DEHP plasticizer leached from PVC-containing devices (e.g., containers) was proposed based on a

review of metabolic and toxicologic considerations.<sup>2185</sup> FDA later evaluated the safety of DEHP exposure by comparing doses of DEHP received by patients undergoing various medical procedures with a defined tolerable intake value of DEHP, a value that was based upon the results of selected critical toxicity studies in experimental animals.<sup>3100</sup> Based on the results of the safety assessment, FDA concluded that there is little risk posed by exposure to the amount of DEHP released from PVC bags used to store and administer drugs that require an excipient for solubilization *when label instructions for preparation and administration are followed*.<sup>3100</sup> However, such conclusions do not take into account increased risk for adverse effects from DEHP exposure in certain patients (e.g., critically ill male neonates or infants, male infants less than 1 year of age, male offspring of pregnant or breast-feeding women undergoing certain medical treatments) or potential adverse effects related to aggregate exposure for patients exposed to multiple medical devices, procedures, or intravenous medications known to leach DEHP, for which there are varying levels of concern.<sup>3100 3101</sup>

Mazzo et al. evaluated the leaching of DEHP plasticizer by docetaxel 0.56 and 0.96 mg/mL in dextrose 5% and in sodium chloride 0.9%. PVC bags of the solutions were used to prepare the admixtures. The leaching of the plasticizer was found to be time and concentration dependent; however, there was little difference between the 2 infusion solutions. After storage for 8 hours at 21°C, leached DEHP was found in the range of 30 to 51 mcg/mL for the 0.96-mg/mL concentration and 25 to 36 mcg/mL for the 0.56-mg/mL concentration. During a simulated 1-hour infusion, the amount of leached DEHP did not exceed 14 mcg/mL.<sup>1825</sup>

A study was performed on the compatibility of docetaxel 0.31 and 0.88 mg/mL in dextrose 5% or sodium chloride 0.9% with various infusion sets. The docetaxel solutions were run through the administration sets and the effluent was analyzed for DEHP plasticizer. At the higher concentration of docetaxel tested (0.88 mg/mL), unacceptable amounts of DEHP were leached from the Baxter vented nitroglycerin set (2C7552S), the Baxter vented volumetric pump nitroglycerin set (2C1042), and the IMED standard PVC set (9210). At both the low and high concentrations tested (0.31 and 0.88 mg/mL), unacceptable amounts of DEHP were leached from the IVAC MiniMed Uni-Set microbore (28026) and MiniMed Uni-Set macrobore full set (28034). The sets cited in Table 1 and Table 2 leached little or no DEHP.<sup>2451</sup>

In another study, 20 mg of docetaxel (Taxotere, Sanofi-Aventis) was first dissolved in 1 mL of dehydrated alcohol and then diluted in 100 mL of sodium chloride 0.9%.<sup>3110</sup> The solution was circulated through an 85-cm length of commercial PVC intravenous infusion tubing (Becton Dickinson) containing 25% DEHP by weight at a rate of 1.2 to 3 mL/min over a period of 1 hour.<sup>3110</sup> A decrease in light transmittance was first detected at 30 minutes and precipitation of the drug was noted by 1 hour.<sup>3110</sup> Precipitation was thought to be the result of leached DEHP interacting with surfactant (polysorbate 80) molecules in the docetaxel formulation, thereby decreasing the solubility of the drug.<sup>3110</sup> This phenomenon was not observed with the use of low-DEHP content (10% by weight) PVC and non-PVC intravenous infusion tubings (Polysciencetech).<sup>3110</sup>

With use of infusion bags and tubing that are free of DEHP plasticizer and the elimination of PVC precision flow regulators, a reduction in leached DEHP of up to 99% has been reported.<sup>2679</sup>

Docetaxel vehicle equivalent to docetaxel 0.74 mg/mL in dextrose 5% was tested in VISIV polyolefin bags at room temperature near 23°C for 24 hours. No leached plastic components were found within the 24-hour study period.<sup>2660 2792</sup>

Docetaxel in PVC containers leached 200 to 500 mcg/mL of DEHP in 48 hours when stored under refrigeration and at room temperature, respectively. The use of nonplasticized containers such as polyethylene plastic containers was recommended.<sup>2718</sup>

**Table 1. Administration sets compatible with docetaxel infusions at concentrations of 0.88 mg/mL or less<sup>2451</sup>**

Manufacturer	Administration Set
Abbott	LifeCare 5000 Plum non-PVC specialty set (11594) LifeCare model 4P specialty set, non-PVC (11434) Life Shield anesthesia pump set OL with cartridge (13503) Nitroglycerin primary i.v. pump set OL, vented (1772) Omni-Flow universal primary i.v. pump short minibore (40527)
Block Medical	Verifuse nonvented administration set with 0.22-µm filter, check valve, and non-DEHP PVC tubing (V021015)
I-Flow	Vivus-400 polyethylene-lined infusion set (5000-784)
IMED	Closed system non-PVC fluid path nonvented quick spike set (9630) Non-PVC set with inline filter (9986) Gemini 20 nonvented primary administration set for nitroglycerin and emulsions (2260)
IVAC	Universal set with low-sorbing tubing (52053, 59953, 575053) Reduced-PVC full set MiniMed Uni-Set macrobore (28190)
Ivion/Medex	WalkMed spike set (SP-06) with pump set (PS-401, PS-360, PS-560)
McGaw	Horizon pump vented nitroglycerin i.v. set (V7450) Intelligent pump vented nitroglycerin i.v. set (V7150)
SoloPak	Primary solution set with universal spike, 0.22-µm filter, and injection site (73600)

**Table 2. Extension sets compatible with docetaxel infusions at concentrations of 0.88 mg/mL or less<sup>2451</sup>**

Manufacturer	Administration Set
Abbott	IVEX-HP filter set (4524) IVEX-2 filter set (2679)
Baxter	Polyethylene-lined extension set with 0.22-µm air-eliminating filter (1C8363)
Becton Dickinson	E-Z infusion set (38-53121) E-Z infusion set shorty (38-53741) Intima i.v. catheter placement set (38-6918-1) J-loop connector (38-1252-2)
Braun	0.2-µm filter extension set (FE-2012L) Small-bore 0.2-µm filter extension set (PFE-2007) Small-bore extension set with T-fitting (ET-04T) Small-bore extension set with reflux valve (ET-116L) Whin-winged extension set 90° Huber needle (HW-2276) Whin extension set with Y-site and Huber needle (HW-2276 YHRF) Y-extension set with valve (ET-08-YL)
Gish Biomedical	VasTack noncoring portal-access needle system (VT 2022)
IMED	0.2-µm add-on filter set (9400XL)
IVAC	Spec-Sets extension set with 0.2-µm inline filter (C20028, C20350)

# Dolasetron Mesylate

AHFS 56:22.20

## Products

Dolasetron mesylate is available in 0.625-mL (12.5-mg) single-use ampuls and 5-mL (100-mg) single-use vials. Each mL of solution contains 20 mg of dolasetron mesylate and 38.2 mg of mannitol with acetate buffer in water for injection.<sup>1(8/08)</sup>

Dolasetron mesylate is also available in 25-mL (500-mg) multidose vials. Each mL of solution contains 20 mg of dolasetron mesylate, 29 mg of mannitol, and 5 mg of phenol with acetate buffer in water for injection.<sup>1(8/08)</sup>

## pH

From 3.2 to 3.8.<sup>1(8/08)</sup>

## Trade Name(s)

Anzemet

## Compatibility Information

### Solution Compatibility

#### Dolasetron mesylate

Test Soln Name	Mfr	Mfr	Conc/L or %	Remarks	Ref	CI

### Y-Site Injection Compatibility (1:1 Mixture)

#### Dolasetron mesylate

Test Drug	Mfr	Conc	Mfr	Conc	Remarks	Ref	CI
Acetaminophen	CAD	10 mg/mL	SAA	20 mg/mL	Physically compatible with less than 10% acetaminophen loss over 4 hr at room temperature	2841, 2844	C
Azithromycin	PF	2 mg/mL <sup>b</sup>	HMR	20 mg/mL <sup>c</sup>	Visually compatible	2368	C
Caspofungin acetate	ME	0.5 mg/mL <sup>b</sup>	SAA	20 mg/mL	Physically compatible with dolasetron mesylate given i.v. push over 2 to 5 min	2766	C

## Administration

Dolasetron mesylate is administered intravenously undiluted up to a rate of 100 mg/30 seconds or diluted in a compatible infusion solution to a volume of 50 mL for infusion over 15 minutes. The administration line should be flushed both before and after dolasetron mesylate administration.<sup>1(8/08)</sup>

## Stability

Dolasetron mesylate injection is a clear, colorless solution. Intact containers should be stored at controlled room temperature and protected from light.<sup>1(8/08)</sup>

## Syringes

Dolasetron mesylate (Aventis) 12.5 mg/0.63 mL was packaged in 1-mL syringes sealed with tip caps. No loss of dolasetron mesylate occurred after 240 days of storage at 22°C.<sup>2626</sup>

## Dopamine Hydrochloride

AHFS 12:12.08.08

### Products

Dopamine hydrochloride is available in 200-mg (40 mg/mL), 400-mg (40 mg/mL), 400-mg (80 mg/mL), 800-mg (80 mg/mL), and 800-mg (160 mg/mL) vials and prefilled syringes. The solutions also contain sodium metabisulfite 0.9% as an antioxidant, citric acid and sodium citrate buffer, and hydrochloric acid or sodium hydroxide to adjust the pH in water for injection.<sup>1(4/07) 4</sup>

Dopamine hydrochloride is available premixed for infusion in concentrations of 0.8, 1.6, and 3.2 mg/mL in dextrose 5%. Also present are sodium metabisulfite 0.5 mg/mL and hydrochloric acid and/or sodium hydroxide for pH adjustment.<sup>1(4/07)</sup>

### pH

Dopamine hydrochloride injection has a pH of about 3.3 (range 2.5 to 5). The premixed dopamine hydrochloride infusions have a pH of about 3.3 to 3.8 (range 2.5 to 4.5).<sup>1(4/07) 4</sup>

### Osmolality

The osmolality of dopamine hydrochloride 40 mg/mL was 619 mOsm/kg by freezing-point depression and 581 mOsm/kg by vapor pressure.<sup>1071</sup> At a concentration of 10 mg/mL (diluent unspecified), the osmolality was determined to be 277 mOsm/kg.<sup>1233</sup>

### Osmolarity

The osmolarity of premixed dopamine hydrochloride in dextrose 5% (Hospira) is 261, 269, and 286 mOsm/L for the 0.8-, 1.6-, and 3.2-mg/mL concentrations, respectively.<sup>1(4/07) 4</sup>

### Administration

Dopamine hydrochloride is administered by intravenous infusion into a large vein using an infusion pump or other infusion control device. The premixed infusion solutions are suitable for administration without dilution, but the concentrated injection must be diluted for use. Often the dose of concentrate is added to 250 or 500 mL of compatible solution. The concentration used depends on the patient's requirements. Concentrations as high as 3200 mcg/mL have been used.<sup>1(4/07) 4</sup>

### Stability

Intact containers of dopamine hydrochloride should be stored at controlled room temperature. The injections should be protected from excessive heat and from freezing.<sup>1(4/07) 4</sup> Do not use the injection if it is darker than slightly yellow or discolored in any other way.<sup>1(4/07)</sup>

Dopamine hydrochloride under simulated summer conditions in paramedic vehicles was exposed to temperatures ranging from 26 to 38°C over 4 weeks. Analysis found no loss of the drug under these conditions.<sup>2562</sup>

### pH Effects

The pH of the solution is one of the most critical factors determining dopamine hydrochloride stability. Dopamine hydrochloride

is stable over a pH range of 4 to 6.4 when mixed with other drugs in dextrose 5%,<sup>312</sup> but it is most stable at pH 5 or below.<sup>79</sup> In alkaline solutions, the catechol moieties are oxidized, cyclized, and polymerized to colored materials,<sup>312</sup> forming a pink to violet color.<sup>78</sup> Decomposition is also indicated by the formation of a yellow or brown discoloration of the solution.<sup>4</sup> Discolored solutions should not be used.<sup>1(4/07) 4 312</sup>

### Freezing Solutions

Dopamine hydrochloride 0.5 mg/mL in dextrose 5% was frozen at -20°C in polypropylene syringes (Codan Medical and B. Braun) for 6 months. No visible precipitation or color change was observed. However, layering or stratification occurred in the frozen samples. Repeated inversion of the syringes was required to yield a clear and uniform solution. Less than 2% dopamine loss occurred in 6 months to samples in the Codan syringes. However, samples frozen in the Braun syringes were less stable, with dopamine losses up to 14%. The Braun syringes when frozen allowed air to enter into the product, which could compromise sterility as well as stability.<sup>2530</sup>

### Light Effects

Exposure of dopamine hydrochloride 100 mg/100 mL in dextrose 5% to fluorescent and blue phototherapy light for 36 hours at 25°C, while static or flowing through tubing at 2 mL/hr, resulted in no significant difference in drug concentration compared to controls stored in the dark. Because no unacceptable loss occurs, protection of dopamine hydrochloride infusions from blue phototherapy lights is not necessary.<sup>1100</sup>

### Syringes

Dopamine hydrochloride (Abbott) 200 mg/50 mL in dextrose 5% exhibited no change in appearance and no drug loss when stored in 60-mL plastic syringes (Becton Dickinson) for 24 hours at 25°C.<sup>1579</sup>

Dopamine hydrochloride (Therabel Lucien Pharma) 4 mg/mL in dextrose 5% was packaged in 50-mL polypropylene syringes (Becton Dickinson) and stored at 4 and 24°C in the dark and exposed to room light for 48 hours. Dopamine losses were less than 10% throughout the study.<sup>1961</sup>

### Sorption

Dopamine hydrochloride has been shown not to exhibit sorption to polyvinyl chloride (PVC) bags and tubing, polyethylene tubing, polypropylene syringes, and polypropylene-polystyrene syringes.<sup>536 784 1961</sup>

### Filtration

Dopamine hydrochloride 100 mcg/mL in dextrose 5% or sodium chloride 0.9% was delivered over 5 hours through 4 kinds of 0.2-µm membrane filters varying in size and composition. Dopamine concentration losses of 3 to 5% were found during the first 60 minutes; subsequent dopamine levels returned to the original concentration when the binding sites became saturated.<sup>1399</sup>

### Central Venous Catheter

Dopamine hydrochloride (Abbott) 3.2 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was

found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

Zidovudine	BW	4 mg/mL <sup>a</sup>	AB	1.6 mg/mL <sup>a</sup>	Physically compatible for 4 hr at 25°C	1193	C

<sup>a</sup> Tested in dextrose 5%.

<sup>b</sup> Tested in sodium chloride 0.9%.

<sup>c</sup> Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>d</sup> Tested in sterile water for injection.

<sup>e</sup> Tested in dextrose 5%, Ringer's injection, lactated, sodium chloride 0.45%, and sodium chloride 0.9%.

<sup>f</sup> Tested in bacteriostatic sodium chloride 0.9% preserved with benzyl alcohol 0.9%.

<sup>g</sup> Tested in dextrose 5% in Ringer's injection, dextrose 5% in Ringer's injection, lactated, dextrose 5%, Ringer's injection, lactated, and sodium chloride 0.9%.

<sup>h</sup> Tested as the premixed infusion solution.

<sup>i</sup> Tested with albumin human 0.1%.

<sup>j</sup> Lyophilized formulation tested.

<sup>k</sup> Refer to Appendix for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>l</sup> Injected into a line being used to infuse dopamine hydrochloride in dextrose 5% in sodium chloride 0.3% with potassium chloride 20 mEq.

<sup>m</sup> Tested in dextrose 5% in sodium chloride 0.45%.

<sup>n</sup> Tested in Ringer's injection, lactated.

<sup>o</sup> Final concentration after mixing.

<sup>p</sup> Nesiritide is incompatible with bisulfite antioxidants used in some drug formulations. The specific formulation of the product to be used should be checked to assure that no sulfite antioxidants are present.

<sup>q</sup> Test performed using the formulation WITHOUT edetate disodium.

<sup>r</sup> Test performed using the formulation WITH edetate disodium.

<sup>s</sup> Tested in either dextrose 5% or in sodium chloride 0.9%, but the report did not specify which solution.

<sup>t</sup> Tested in a 1:1 mixture of (1) dextrose 5% and dextrose 5% in sodium chloride 0.45% with and without potassium chloride 20 mEq/L and also in (2) dextrose 10% in sodium chloride 0.45% with and without potassium chloride 20 mEq/L.

<sup>u</sup> Tested in a 1:1 mixture of dextrose 5% and TPN #274 (see Appendix).

<sup>v</sup> Piperacillin component. Piperacillin in an 8:1 fixed-ratio concentration with tazobactam.

<sup>w</sup> Ceftolozane component. Ceftolozane in a 2:1 fixed-ratio concentration with tazobactam.

<sup>x</sup> Quinupristin and dalbopristin components combined.

<sup>y</sup> Salt not specified.

<sup>z</sup> Test performed using the Cubicin formulation.

<sup>aa</sup> Meropenem component. Meropenem in a 1:1 fixed-ratio concentration with vaborbactam.

<sup>bb</sup> Ceftazidime component. Ceftazidime in a 4:1 fixed-ratio concentration with avibactam.

<sup>cc</sup> Tested in dextrose 5%, sodium chloride 0.9%, and Ringer's injection, lactated.

## Doripenem

AHFS 8:12.07.08

### Products

Doripenem is available in single-use vials containing doripenem 250 or 500 mg on the anhydrous basis.<sup>2916</sup> Reconstitute each vial with 10 mL of sterile water for injection or sodium chloride 0.9% and gently shake to form a 25- or 50-mg/mL suspension, respectively.<sup>2916</sup> These suspensions are not suitable for administration.<sup>2916</sup>

To prepare as a solution suitable for intravenous infusion, withdraw the vial contents using a syringe with a 21-gauge needle and transfer to an appropriately-sized infusion bag of dextrose 5% or sodium chloride 0.9%, shaking gently after addition until the solution is clear.<sup>2916</sup> For a 250-mg dose prepared using the 250-mg vial, the vial contents should be transferred to a 50- or 100-mL infusion bag to yield a doripenem concentration of approximately 4.2 or 2.3 mg/mL, respectively.<sup>2916</sup> For a 500-mg dose prepared using the 500-mg vial, the vial contents should be transferred to a 100-mL infusion bag to yield a doripenem concentration of approximately 4.5 mg/mL.<sup>2916</sup>

Alternatively, for a 250-mg dose prepared using the 500-mg vial, the vial contents should be withdrawn from the vial using a syringe with a 21-gauge needle and added to a 100-mL infusion bag of dextrose 5% or sodium chloride 0.9%.<sup>2916</sup> The bag should be gently shaken until the solution is clear.<sup>2916</sup> Then 55 mL of this solution should be removed and discarded;<sup>2916</sup> the remaining solution delivers 250 mg of doripenem at a concentration of approximately 4.5 mg/mL.<sup>2916</sup>

### pH

From 4.5 to 5.5.<sup>2916</sup>

### Trade Name(s)

Doribax

### Administration

Doripenem is administered by intravenous infusion over 1 hour after dilution in dextrose 5% or sodium chloride 0.9%.<sup>2916</sup>

### Stability

Intact vials of doripenem should be stored at controlled room temperature.<sup>2916</sup> After initial reconstitution, the suspension may be stored for up to 1 hour prior to adding to the intravenous solution.<sup>2916</sup>

After dilution in dextrose 5% or sodium chloride 0.9%, the solution may range from colorless to slightly yellow in appearance; variations in color within this range are not indications of differences in drug stability.<sup>2916</sup> The manufacturer states that doripenem is stable for 4 hours in dextrose 5% and 12 hours in sodium chloride 0.9% at room temperature.<sup>2916</sup> If stored under refrigeration, doripenem is stated to be stable for 24 hours in dextrose 5% and 72 hours in sodium chloride 0.9%.<sup>2916</sup> These time frames include both storage and administration.<sup>2916</sup>

### Freezing Solutions

The manufacturer states that the initial reconstituted doripenem suspension or diluted solutions for infusion should not be frozen.<sup>2916</sup>

Solutions of doripenem 5 and 10 mg/mL in sodium chloride 0.9% were frozen at  $-20^{\circ}\text{C}$ . Upon thawing a visible white precipitate was found. Vigorous shaking for 3 to 12 minutes resulted in the precipitate no longer being visible. Not more than 5% doripenem loss occurred upon 14 days of frozen storage followed by 24 hours of thawing under refrigeration and then 2 hours at room temperature; a similar amount of loss occurred upon 28 days of frozen storage followed by 4 to 6 hours of thawing at room temperature.<sup>2809</sup>

## Doxapram Hydrochloride

AHFS 28:20.32

### Products

Doxapram hydrochloride is available in 20-mL multiple-dose vials.<sup>3220</sup> Each mL of solution contains doxapram hydrochloride 20 mg and benzyl alcohol 0.9% in water for injection.<sup>3220</sup>

Infusions of doxapram may be prepared by transferring 12.5 mL (250 mg) of doxapram hydrochloride to an infusion bag containing 250 mL of dextrose 5%, dextrose 10%, or sodium chloride 0.9% or adding 20 mL (400 mg) of doxapram hydrochloride to 180 mL of dextrose 5%, dextrose 10%, or sodium chloride 0.9%; the concentration to be prepared is dependent upon the indication.<sup>3220</sup>

### pH

The pH of the undiluted injection ranges from 3.5 to 5.<sup>3220</sup>

### Trade Name(s)

Dopram

### Administration

Doxapram hydrochloride is administered by intravenous injection or by intravenous infusion following dilution in a compatible infusion solution.<sup>3220</sup>

### Stability

Doxapram hydrochloride is a clear, colorless solution.<sup>3220</sup> Intact vials of doxapram hydrochloride injection should be stored at controlled room temperature.<sup>3220</sup>

### pH Effects

Doxapram hydrochloride in solution became turbid when the pH was adjusted from 3.8 to 5.7 with 0.1 N sodium hydroxide.<sup>1177</sup> When the pH was adjusted down to 1.9 with 0.1 N hydrochloric acid, no visible change occurred to the clear solution.<sup>1177</sup> The drug is stated to be incompatible with alkaline drugs.<sup>3220</sup>

At pH 2.5 to 6.5, doxapram hydrochloride remained chemically stable for 24 hours.<sup>1177</sup> At pH 7.5 and above, a 10 to 15% doxapram hydrochloride loss occurred in about 6 hours.<sup>1177</sup>

## Doxorubicin Hydrochloride

### AHFS 10:00

#### Products

Doxorubicin hydrochloride is available as a lyophilized product in 10-, 20-, and 50-mg single-dose glass vials with 50 mg of lactose for each 10 mg of doxorubicin hydrochloride.<sup>1(10/06)</sup>

Reconstitution of the lyophilized products should be performed with sodium chloride 0.9%. Bacteriostatic diluents are not recommended. Add 5, 10, or 25 mL sodium chloride 0.9% to the 10-, 20-, or 50-mg vial, respectively. After the diluent is added, the vial should be shaken and the drug allowed to dissolve, forming a 2-mg/mL solution.<sup>1(10/06)</sup>

Additionally, doxorubicin hydrochloride is available in 5-, 10-, 25-, and 100-mL vials as a 2-mg/mL solution without preservatives. The solution also contains sodium chloride 0.9% and hydrochloric acid to adjust the pH in water for injection.<sup>1(10/06)</sup>

#### pH

The pH of lyophilized doxorubicin hydrochloride reconstituted with sodium chloride 0.9% is 3.8 to 6.5.<sup>4</sup> The pH of the solution products is adjusted to 3.<sup>1(10/06)</sup>

#### Trade Name(s)

Adriamycin

#### Administration

Doxorubicin hydrochloride is administered intravenously, preferably into the tubing of a running intravenous infusion of sodium chloride 0.9% or dextrose 5% over not less than 3 to 5 minutes.<sup>1(10/06)</sup> <sup>4</sup> The drug should not be administered intramuscularly or subcutaneously, and extravasation should be avoided because of local tissue necrosis.<sup>1(10/06)</sup>

In the event of spills or leaks, a doxorubicin hydrochloride manufacturer recommends the use of sodium hypochlorite 5% (household bleach) for inactivation.<sup>1200</sup>

#### Stability

Doxorubicin hydrochloride liquid injections should be stored under refrigeration and protected from light. Intact vials should be kept in their cartons until use.<sup>1(10/06)</sup> <sup>4</sup>

The lyophilized products in intact vials should be stored at room temperature and protected from light. The manufacturer states that its reconstituted lyophilized products are stable for 7 days at room temperature and 15 days under refrigeration.<sup>1(10/06)</sup>

For 50-mcg/mL and 0.5-mg/mL doxorubicin hydrochloride solutions, Janssen et al. reported that a greater rate of decomposition occurred in the more concentrated solution.<sup>1206</sup> However, most other studies found no concentration dependence for the degradation rate.<sup>489 526 1208 1255</sup>

A darkening of doxorubicin hydrochloride color has been noted when solutions of the drug contact aluminum metal. This change was initially noticed in the first small amount of drug

to be injected through a needle with an aluminum hub. When solutions of doxorubicin hydrochloride containing aluminum are allowed to stand, the color becomes much darker than the control. Precipitation may also occur. As a precautionary measure, the author recommended not using any aluminum-containing apparatus for preparing or administering doxorubicin hydrochloride.<sup>653</sup>

In another evaluation, stainless steel needles with steel or plastic hubs and pieces of aluminum were immersed in doxorubicin hydrochloride 2 mg/mL in sterile water for injection or sodium chloride 0.9%. After 24 hours, the solutions containing the needles were unchanged in appearance and pH. The solution containing the aluminum was darker in color, and the pH had changed from 4.8 to 5.2. The concentrations of all solutions remained the same after 6 hours, but after 3 days, the solution containing aluminum was down to 91.9% while the others were only down to 94.4%. The authors concluded that doxorubicin hydrochloride does react with aluminum but at a slow rate and without major loss. They recommended not storing the drug in syringes capped with aluminum-hubbed needles but thought that doxorubicin could be injected safely through aluminum-hubbed needles.<sup>887</sup>

Immersion of a needle with an aluminum component in doxorubicin hydrochloride (Adria) 2 mg/mL resulted in a darkening of the solution, with black patches forming on the aluminum in 12 to 24 hours at 24°C with protection from light.<sup>988</sup>

Doxorubicin hydrochloride 0.5 mg/mL in sodium chloride 0.9% supported the growth of *Escherichia coli*, *Klebsiella pneumoniae*, *Pseudomonas aeruginosa*, and *Candida albicans*, which are implicated in nosocomial infections. The arbitrary extension of expiration dates to doxorubicin hydrochloride solutions is highly questionable.<sup>827</sup>

Doxorubicin hydrochloride, etoposide phosphate, and vincristine sulfate admixtures at a variety of concentrations were unable to pass the USP test for antimicrobial effectiveness. Mixtures of these drugs are not "self-preserving" and permit microbial growth.<sup>2343</sup> The potential for microbiological growth should be considered when assigning expiration periods.

#### pH Effects

Doxorubicin hydrochloride appears to have pH-dependent stability in solution.<sup>526 1007 1037</sup> It becomes progressively more stable as the pH of drug-infusion solution admixtures becomes more acidic at 7.4 to 4.5.<sup>526</sup> The pH range of maximum stability has been variously stated to be about 4 to 5,<sup>1007 1460 3 to 4, 1037</sup> and about 4.<sup>1208</sup> At a concentration of 0.1 mg/mL in buffer solutions stored at 4°C, no significant doxorubicin loss occurred in 60 days at pH 4, but substantial decomposition occurred at pH 7.4.<sup>1206</sup> Doxorubicin hydrochloride is unstable at pH values less than 3 or greater than 7.<sup>4</sup> In acidic media, splitting of the glycosidic bond results in a red-colored, water-insoluble aglycone and

a water-soluble amino sugar.<sup>4</sup> In alkaline media, a color change to deep purple is indicative of decomposition. This color change also occurs with other anthracyclines.<sup>394</sup> It is thought to reflect cleavage of the amino sugar, resulting in an ineffective moiety.<sup>524</sup>

### Freezing Solutions

Hoffman et al. found that doxorubicin hydrochloride, reconstituted to 2 mg/mL with sterile water for injection and kept at 4°C, exhibited a 1.5% loss in 1 month and a 10.5% loss in 6 months. Freezing the solutions at -20°C resulted in no loss over 30 days. It was indicated that filtration of stored solutions through a 0.22- $\mu$ m filter was appropriate to ensure sterility.<sup>652</sup>

Doxorubicin hydrochloride (Farmitalia) 70 mg/50 mL in polyvinyl chloride (PVC) bags of sodium chloride 0.9% (Travenol) could be frozen at -20°C for at least 30 days and thawed by exposure to microwave radiation for 2 minutes with no significant change in concentration. However, the doxorubicin hydrochloride concentration apparently began declining after the fourth repetition of the freeze-thaw treatment with a loss of about 5%.<sup>818</sup>

The stability of doxorubicin hydrochloride 1 mg/mL in sodium chloride 0.9% in PVC containers at -20°C was evaluated. No drug loss occurred after 2 weeks of storage and thawing for 150 minutes at room temperature or 180 seconds in a microwave oven. Refreezing the solutions and rethawing at room temperature or in a microwave oven 3 weeks later (total of 5 weeks of frozen storage) resulted in 3% drug loss.<sup>1256</sup>

Although the thawing of frozen doxorubicin hydrochloride solutions in microwave ovens has been suggested,<sup>818 1256</sup> Williamson recommended only room temperature thawing because of the risks of drug decomposition from overheating and exposure if the bags burst.<sup>1257</sup>

### Light Effects

Doxorubicin hydrochloride is sensitive to light, especially in very dilute solutions.<sup>489 1073 1094</sup> However, the photolability of dilute solutions is not observed with more concentrated solutions. A 10-fold difference in photolability half-life was found between concentrations of 0.01 and 0.1 mg/mL.<sup>1594</sup> The manufacturers recommend protecting the solutions from exposure to sunlight and that any unused solution be discarded.<sup>1(10/06) 4</sup>

An evaluation of etoposide phosphate (Bristol-Myers Squibb) 2 mg/mL, doxorubicin hydrochloride 0.4 mg/mL, and vincristine sulfate 0.016 mg/mL (16 mcg/mL) in sodium chloride 0.9% in polyolefin plastic bags (McGaw) found little or no effect of constant exposure to normal fluorescent room light for 124 hours. The admixtures were physically compatible, and all 3 drugs in the admixture remained stable throughout the time period stored at an elevated temperature of 35 to 40°C.<sup>2343</sup>

### Syringes

Doxorubicin hydrochloride (Farmitalia) 2 mg/mL repackaged in polypropylene syringes exhibited little loss after storage for 43 days at 4°C.<sup>1460</sup>

Doxorubicin hydrochloride (Adria) 2 mg/mL in sodium chloride 0.9% in glass vials and plastic syringes (Monoject and Terumo) and also 1 mg/mL in sodium chloride 0.9% in plastic

syringes (Monoject) exhibited no visual changes and little or no loss when stored at 4 and 23°C while exposed to light for 124 days. Potential extractable materials from the syringes were not detected during the study period.<sup>1594</sup>

### Implantable Pumps

Vogelzang et al. reported the stability of 3- and 5-mg/mL concentrations in sodium chloride 0.9% in the reservoir of a Medtronic DAD implantable pump at 37°C. Losses of about 5 to 6% in 1 week and 9 to 11% in 2 weeks occurred. Analyses after longer periods continued to show about a 5 to 6% loss per week at 37°C.<sup>1255</sup>

### Sorption

Doxorubicin hydrochloride 16 mcg/mL in dextrose 5% and sodium chloride 0.9% in PVC containers was infused through PVC infusion sets at 21 mL/hr over 24 hours at 22°C while exposed to light. No evidence of sorption was found.<sup>1700</sup>

Doxorubicin hydrochloride (Farmitalia) 1 mg/mL in sodium chloride 0.9% exhibited no loss due to sorption to PVC and polyethylene administration lines during simulated infusions at 0.875 mL/hr for 2.5 hours via a syringe pump.<sup>1795</sup>

### Filtration

Although doxorubicin hydrochloride was reported to undergo considerable binding to cellulose ester and polytetrafluoroethylene filters,<sup>1249 1415 1416</sup> other studies did not confirm unacceptable losses at clinical concentrations. Doxorubicin hydrochloride 2 mg/mL in sterile water for injection showed no loss due to filtration when filtered through a 0.22- $\mu$ m Millex filter.<sup>652</sup>

In another study, doxorubicin hydrochloride (Adria) 30 mg/15 mL was injected as a bolus through a 0.2- $\mu$ m nylon, air-eliminating filter (Ultipor, Pall) to evaluate the effect of filtration on simulated intravenous push delivery. About 92% of the drug was delivered through the filter after flushing with 10 mL of sodium chloride 0.9%.<sup>809</sup>

Doxorubicin hydrochloride 1 mg/mL in sodium chloride 0.9% exhibited little loss due to sorption to cellulose acetate (Minisart 45, Sartorius), polysulfone (Acrodisc 45, Gelman), and nylon (Nylaflo, Gelman) filters. However, a 20 to 25% loss due to sorption occurred during the first 60 minutes of infusion through nylon filters (Utipore, Pall). A 35% loss was found during the first 15 min using a nylon filter (Posidyne ELD96, Pall). Return to the full concentrations occurred gradually within 1.5 to 2.5 hours.<sup>1795</sup>

### Central Venous Catheter

Doxorubicin hydrochloride (Pharmacia) 0.25 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

# Doxorubicin Hydrochloride Liposomal

AHFS 10:00

## Products

Doxorubicin hydrochloride liposomal is available as a red translucent liposomal dispersion providing 2 mg/mL of doxorubicin hydrochloride packaged in vials containing 20 and 50 mg of drug.<sup>1(1/08)</sup>

Over 90% of the doxorubicin hydrochloride is provided inside liposome carriers composed of *N*-(carbonyl-methoxypolyethylene glycol 2000)-1,2-distearoyl-*sn*-glycero-3-phosphoethanolamine sodium, 3.19 mg/mL; fully hydrogenated soy phosphatidylcholine, 9.58 mg/mL; and cholesterol, 3.19 mg/mL. The product also contains about 2 mg/mL of ammonium sulfate, histidine as a buffer, hydrochloric acid and/or sodium hydroxide to adjust pH, and sucrose to adjust tonicity.<sup>1(1/08)</sup>

**CAUTION:** Care should be taken to ensure that the correct drug product, dose, and administration procedures are used and that no confusion with other products occurs.

## Trade Name(s)

Doxil

## Administration

Doxorubicin hydrochloride liposomal is administered intravenously after dilution in dextrose 5%. Doses of 90 mg or less should be diluted in 250 mL, while doses exceeding 90 mg should be diluted in 500 mL of dextrose 5%. The product should not be administered as a bolus injection, as the undiluted dispersion, as a rapid infusion, or by other routes. Extravasation should be avoided; the drug is extremely irritating to tissues. The use of protective gloves during dose preparation is recommended.<sup>1(1/08)</sup>

The functional properties of a drug incorporated into a liposomal dispersion like this one may differ substantially from the functional properties of the conventional aqueous formulation.<sup>1(1/08)</sup>

**CAUTION:** Care should be taken to ensure that the correct drug product, dose, and administration procedures are used and that no confusion with other products occurs.

## Stability

Intact vials of doxorubicin hydrochloride liposomal should be stored under refrigeration at 2 to 8°C. After dilution in dextrose 5% for administration, the drug should be stored under refrigeration and administered within 24 hours after preparation. Freezing should be avoided because prolonged freezing may adversely affect liposomal products. However, short-term freezing (less than 1 month) did not adversely affect this product.<sup>1(1/08)</sup>

Doxorubicin hydrochloride liposomal 0.15 mg/mL in dextrose 5% did not result in the loss of viability of *Staphylococcus aureus*, *Enterococcus faecium*, *Pseudomonas aeruginosa*, and *Candida albicans* within 120 hours at 22°C. Diluted solutions should be stored under refrigeration whenever possible, and the potential for microbiological growth should be considered when assigning expiration periods.<sup>2740</sup>

## Filtration

Doxorubicin hydrochloride liposomal is a liposomal dispersion; filtration, including inline filtration, should not be performed.<sup>1(1/08)</sup>

## Doxycycline Hyclate

AHFS 8:12.24

### Products

Doxycycline hyclate is available as a lyophilized powder in vials containing the equivalent of 100 mg of doxycycline with ascorbic acid 480 mg and mannitol 300 mg or the equivalent of 200 mg of doxycycline with ascorbic acid 960 mg and mannitol 600 mg.<sup>3071</sup>

The 100- or 200-mg vials should be reconstituted with 10 mL or 20 mL, respectively, of sterile water for injection; sodium chloride; dextrose 5%; Ringer's injection; invert sugar 10%; Ringer's injection, lactated; dextrose 5% in Ringer's injection, lactated; Normosol M or R in dextrose 5%; or Plasma-Lyte 56 or 148 in dextrose 5%.<sup>3071</sup> The resultant solution contains the equivalent of 10 mg/mL of doxycycline.<sup>3071</sup> This reconstituted solution must be further diluted to a concentration of 0.1 to 1 mg/mL with a compatible infusion solution prior to use.<sup>3071</sup> (See Solution Compatibility.)

### pH

The pH range for reconstituted solutions of 10 mg/mL is 1.8 to 3.3.<sup>3071</sup>

### Osmolality

The osmolality of doxycycline (Elkins-Sinn) 1 mg/mL was determined to be 292 mOsm/kg in dextrose 5% and 310 mOsm/kg in sodium chloride 0.9%.<sup>1375</sup>

### Administration

Doxycycline hyclate is administered by intravenous infusion, usually over 1 to 4 hours.<sup>3071</sup> Rapid administration should be avoided.<sup>3071</sup> The reconstituted solution should be diluted further with a compatible infusion solution to a concentration of 0.1 to 1 mg/mL.<sup>3071</sup> Other parenteral routes (e.g., intramuscular, subcutaneous) are not recommended, and extravasation should be avoided.<sup>3071</sup>

### Stability

Intact vials should be stored at 20 to 25°C and should remain in the carton until time of use to protect from light.<sup>3071</sup>

Solutions of doxycycline at concentrations of 0.1 to 1 mg/mL prepared with sodium chloride, dextrose 5%, Ringer's injection,

or invert sugar 10% may be stored for up to 72 hours prior to starting the infusion when kept in the refrigerator and protected from both direct sunlight and artificial light.<sup>3071</sup> Infusions must then be completed within 12 hours.<sup>3071</sup>

Doxycycline prepared in sodium chloride or dextrose 5% is noted to be stable under fluorescent light for 48 hours, but must be protected from direct sunlight during storage and infusion.<sup>3071</sup> Doxycycline prepared in Ringer's injection, invert sugar 10%, Ringer's injection, lactated, or dextrose 5% in Ringer's injection, lactated also must be protected from direct sunlight during infusion.<sup>3071</sup>

Because of the acidity of the solution, doxycycline hyclate may precipitate the free acids of barbiturate salts and sulfonamide derivatives. It may also adversely affect the stability of acid-labile drugs.<sup>6 20 22 27</sup>

### Freezing Solutions

The manufacturer states that at a concentration of 10 mg/mL in sterile water for injection, doxycycline is stable for 8 weeks when frozen at -20°C immediately following reconstitution.<sup>3071</sup> Frozen solutions that have been completely thawed should not be heated.<sup>3071</sup> Thawed solutions should not be refrozen.<sup>3071</sup>

Doxycycline (Pfizer) 10 mg/mL in sterile water for injection was stable for 8 weeks when frozen at -20°C. At a concentration of 1 mg/mL in dextrose 5%, doxycycline also showed no significant decomposition over 8 weeks at -20°C.<sup>310</sup>

### Sorption

Doxycycline was shown not to exhibit sorption to PVC bags and tubing, polyethylene tubing, Silastic tubing, and polypropylene syringes.<sup>536 606</sup>

### Central Venous Catheter

Doxycycline (Fujisawa) 0.5 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

## Compatibility Information

### Solution Compatibility

#### Doxycycline hyclate

Test Soln Name	Mfr	Mfr	Conc/L or %	Remarks	Ref	C/I
Dextrose 5%			0.1 to 1 g	Stable for 48 hr at 25°C	3071	C
Dextrose 5%	BA <sup>a</sup>	PF	800 mg and 1 g	Visually compatible with 5 to 8% loss in 96 hr at 23°C. 2% loss in 7 days at 4°C	1928	C

TPN #212 to #215 <sup>f</sup>			LY	1 mg/mL <sup>a</sup>	Physically compatible for 4 hr at 23°C	2109	C
Vinorelbine tartrate	BW	1 mg/mL <sup>b</sup>	ES	1 mg/mL <sup>b</sup>	Physically compatible for 4 hr at 22°C	1558	C

<sup>a</sup> Tested in dextrose 5%.<sup>b</sup> Tested in sodium chloride 0.9%.<sup>c</sup> Tested in both dextrose 5% and sodium chloride 0.9%.<sup>d</sup> Tested in sterile water for injection.<sup>e</sup> Lyophilized formulation tested.<sup>f</sup> Refer to Appendix for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.<sup>g</sup> Run at 21 mL/hr.<sup>h</sup> Given over 30 minutes by syringe pump.<sup>i</sup> Run at 94 mL/hr.

### *Y-Site Injection Compatibility (1:1 Mixture) (Cont.)*

<sup>j</sup> Test performed using the formulation WITHOUT edetate disodium.

<sup>k</sup> Tested in Ringer's injection, lactated.

<sup>l</sup> Piperacillin component. Piperacillin in an 8:1 fixed-ratio concentration with tazobactam.

<sup>m</sup> Ceftolozane component. Ceftolozane in a 2:1 fixed-ratio concentration with tazobactam.

<sup>n</sup> Meropenem component. Meropenem in a 1:1 fixed-ratio concentration with vaborbactam.

<sup>o</sup> Test performed using the formulation WITH edetate disodium.

# Droperidol

AHFS 28:24.92

## Products

Droperidol is available in 1- and 2-mL ampuls and vials.<sup>2906 2907</sup> Each mL of solution contains droperidol 2.5 mg with lactic acid and, if necessary, sodium hydroxide<sup>2907</sup> to adjust the pH.<sup>2906 2907</sup>

## pH

From 3 to 3.8.<sup>2906 2907</sup>

## Osmolality

The osmolality of droperidol 2.5 mg/mL was determined to be 16 mOsm/kg.<sup>1233</sup>

## Administration

Droperidol may be administered intramuscularly or slowly intravenously.<sup>2906 2907</sup>

## Stability

Intact ampuls and vials of droperidol should be stored at controlled room temperature and retained in the original container to protect from light.<sup>2906 2907</sup>

Precipitation may occur if droperidol is mixed with barbiturates.<sup>4</sup>

## Syringes

The stability of droperidol 2.5 mg/mL repackaged in polypropylene syringes was evaluated. Little change in concentration was found after 4 weeks at room temperature out of direct light.<sup>2164</sup>

## Central Venous Catheter

Droperidol (Abbott) 0.4 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

## Compatibility Information

### Solution Compatibility

#### Droperidol

Test Soln Name	Mfr	Mfr	Conc/L or %	Remarks	Ref	C/I
Dextrose 5%	AB <sup>a</sup> , TR <sup>b</sup>	JN	20 mg	Physically compatible and stable for 7 days at 27°C	750	C
Ringer's injection, lactated	TR <sup>a</sup>	JN	20 mg	Physically compatible and stable for 7 days at 27°C	750	C
Ringer's injection, lactated	TR <sup>b</sup>	JN	20 mg	Physically compatible. Stable with no loss for 24 hr at 27°C. 15% loss in 48 hr attributed to sorption	750	C
Sodium chloride 0.9%	AB <sup>a</sup>	JN	20 mg	Physically compatible with about 5% drug loss in 7 days at 27°C	750	C
Sodium chloride 0.9%	TR <sup>b</sup>	JN	20 mg	Physically compatible and stable for 7 days at 27°C	750	C
Sodium chloride 0.9%	<sup>c</sup>	AMR	1.25 g	Compatible and stable for 24 hr at 23°C. Droperidol precipitates if refrigerated	2199	C

<sup>a</sup> Tested in glass containers.

<sup>b</sup> Tested in PVC containers.

<sup>c</sup> Tested in polypropylene syringes.

## Additive Compatibility

### Droperidol

Test Drug	Mfr	Conc/L or %	Mfr	Conc/L or %	Test Solution	Remarks	Ref	C/I
Butorphanol tartrate	HE	80 mg	XU	50 mg	NS <sup>c</sup>	Physically compatible with less than 2% loss of either drug in 15 days at 4 and 25°C protected from light	2908	C
Fentanyl citrate with ketamine HCl	DB JN	10 mg 1 g	JN	50 mg	NS <sup>a</sup>	Visually compatible. 5% increase in all drugs in 30 days at 4 and 25°C due to water loss	2653	C
Fentanyl citrate with ketamine HCl	DB JN	10 mg 1 g	JN	50 mg	NS <sup>b</sup>	Visually compatible with little loss of the drugs in 30 days at 25°C	2653	C
Ketamine HCl with fentanyl citrate	JN DB	1 g 10 mg	JN	50 mg	NS <sup>a</sup>	Visually compatible. 5% increase in all drugs in 30 days at 4 and 25°C due to water loss	2653	C
Ketamine HCl with fentanyl citrate	JN DB	1 g 10 mg	JN	50 mg	NS <sup>b</sup>	Visually compatible with little loss of the drugs in 30 days at 25°C	2653	C

<sup>a</sup> Tested in PVC containers.

<sup>b</sup> Tested in glass containers.

<sup>c</sup> Tested in PVC and glass containers.

## Drugs in Syringe Compatibility

### Droperidol

Test Drug	Mfr	Amt	Mfr	Amt	Remarks	Ref	C/I
Atropine sulfate	ST	0.4 mg/1 mL	MN	2.5 mg/1 mL	Physically compatible for at least 15 min	326	C
Bleomycin sulfate		1.5 units/0.5 mL		1.25 mg/0.5 mL	Physically compatible for 5 min at room temperature followed by 8 min of centrifugation	980	C
Buprenorphine HCl					Physically and chemically compatible	4	C
Butorphanol tartrate	BR	4 mg/2 mL	MN	5 mg/2 mL	Physically compatible for 30 min at room temperature	566	C
