The osmolality of oxacillin sodium 50 mg/mL was 381 mOsm/kg in dextrose 5% and 396 mOsm/kg in sodium chloride 0.9%.<sup>1375</sup>

The osmolality of oxacillin sodium was calculated for the following dilutions:<sup>1054</sup>

Diluent	Osmolality (mOsm/kg)	
	50 mL	100 mL
<b>1 g</b>		
Dextrose 5%	326	295
Sodium chloride 0.9%	353	321
<b>2 g</b>		
Dextrose 5%	379	329
Sodium chloride 0.9%	406	356

The following maximum oxacillin sodium concentrations have been recommended to achieve osmolalities suitable for peripheral infusion in fluid-restricted patients:<sup>1180</sup>

Diluent	Maximum Concentration (mg/mL)	Osmolality (mOsm/kg)
Dextrose 5%	59	530
Sodium chloride 0.9%	53	519
Sterile water for injection	106	422

The frozen premixed solutions are iso-osmotic, having an osmolality of about 300 mOsm/kg.<sup>4</sup>

### Sodium Content

Each gram of oxacillin sodium powder contains approximately 2.5 to 3.1 mEq of sodium.<sup>4</sup>

### Administration

Oxacillin sodium may be administered by deep intramuscular injection, direct intravenous injection, or by continuous or intermittent intravenous infusion. By direct intravenous injection, the dose should be given over a 10-minute period. To minimize vein irritation, intravenous injections should be made as slowly as possible. For intermittent infusion, the drug should be further diluted with a compatible solution to a concentration of 0.5 to 40 mg/mL.<sup>4</sup>

### Stability

Oxacillin sodium in intact vials should be stored at controlled room temperature. After reconstitution, oxacillin sodium is stable for 3 days at room temperature and for 1 week under refrigeration at concentrations used for intramuscular or direct intravenous injection. The reconstituted hospital bulk package is stable for 24 hours at room temperature.<sup>4</sup>

The frozen premixed injection is stable at  $-20^{\circ}\text{C}$  for at least 90 days after shipping. The frozen premixed infusions should be thawed at room temperature or under refrigeration and should not be refrozen after being thawed. The thawed solutions are stated to be stable for 48 hours at room temperature and 21 days under refrigeration.<sup>4</sup>

### Freezing Solutions

Oxacillin sodium, 500 mg/2.5 mL and 1 g/5 mL in sterile water for injection in glass and plastic syringes and 200 mg/mL in the original vial, was frozen at  $-20^{\circ}\text{C}$ . Adequate stability was maintained over 3 months.<sup>303</sup>

In another study, oxacillin sodium 1 g/100 mL of dextrose 5% in polyvinyl chloride (PVC) bags was frozen at  $-20^{\circ}\text{C}$  for 30 days. The bags were then thawed by exposure to ambient temperature or microwave radiation. The solutions had no precipitation or color change and no drug loss. Subsequent storage at room temperature for 24 hours yielded a physically compatible solution, which exhibited a 3 to 4% loss.<sup>554</sup>

### Syringes

Oxacillin sodium (Bristol) 8.33, 16.7, and 33.3 mg/mL in dextrose 5% and in sodium chloride 0.9% packaged in plastic syringes was reported to be stable for 24 hours at room temperature, 8 days refrigerated, and 30 days frozen at  $-20^{\circ}\text{C}$ .<sup>31</sup>

### Ambulatory Pumps

The stability of oxacillin sodium 120 mg/mL in sterile water for injection was evaluated in PVC portable infusion pump reservoirs (Pharmacia Deltec). No oxacillin loss in 3 days at  $25^{\circ}\text{C}$  and 5% loss in 14 days at  $5^{\circ}\text{C}$  was found.<sup>2080</sup>

### Sorption

Little loss due to sorption of oxacillin sodium (Bristol) 1 g/100 mL in dextrose 5% and sodium chloride 0.9% in trilayer solution bags (Bieffe Medital) composed of polyethylene, polyamide, and polypropylene occurred in 2 hours. Similarly, no loss was found during a 1-hour simulated infusion.<sup>1918</sup>

# Oxaliplatin

AHFS 10:00

## Products

Oxaliplatin is available as a 5-mg/mL concentrated solution in 10-, 20-, and 40-mL single-use vials.<sup>2852 2853</sup>

Oxaliplatin is also available in single-use vials containing 50 or 100 mg of lyophilized drug and lactose monohydrate as an excipient.<sup>2854</sup> Reconstitute the 50- or 100-mg vials with 10 or 20 mL, respectively, of water for injection or dextrose 5%.<sup>2854</sup>

## Trade Name(s)

Eloxatin

## Administration

For intravenous infusion, both the concentrated injection and the reconstituted solution must be diluted in 250 to 500 mL of dextrose 5% prior to administration.<sup>2852 2853 2854</sup> Chloride-containing solutions must *not* be used for reconstitution<sup>2854</sup> or dilution.<sup>2852 2853 2854</sup>

Oxaliplatin is administered by intravenous infusion over 2 hours.<sup>2852 2853 2854</sup>

Contact of oxaliplatin solutions with aluminum in needles or metal parts of administration equipment should be avoided.<sup>2852 2853 2854</sup> Aluminum has caused degradation of some platinum compounds.<sup>2852 2853 2854</sup>

## Stability

Intact vials of both formulations are stored at controlled room temperature.<sup>2852 2853 2854</sup> Protect vials of the concentrated solution from light by storing in the outer carton, and do not freeze.<sup>2852 2853</sup> Vials of the lyophilized formulation and solutions diluted for infusion do not require light protection.<sup>2852 2853 2854</sup>

Following reconstitution of the lyophilized oxaliplatin formulation in the original vial, the resulting solution may be stored up to 24 hours under refrigeration.<sup>2854</sup>

After final dilution of either formulation for administration in 250 to 500 mL of dextrose 5%, the manufacturers indicate that the drug is stable for six hours at room temperature or for 24 hours under refrigeration.<sup>2852 2853 2854</sup> However, Sanofi stated that oxaliplatin diluted in dextrose 5% for infusion was stable for 24 hours at room temperature; at a concentration of 3 g/L, the drug was stated to be stable for at least five days at room temperature.<sup>2623</sup>

## pH Effects

Oxaliplatin is incompatible with alkaline drugs and solutions and should not be mixed with or administered simultaneously with them.<sup>2852 2853 2854</sup> Administration lines should be flushed with dextrose 5% prior to administering any other medication.<sup>2852 2853 2854</sup>

## Additional Compatibility Information

### Infusion Solutions

Stability of oxaliplatin (Accord) 0.1 mg/mL in dextrose 5% (Braun), sodium chloride 0.9% (Braun), Ringer's injection, lactated (Braun), Dianeal PD-4 with dextrose 1.36% (Baxter), and phosphate buffer (pH 7.4) 0.14 M at 42°C was evaluated for use of the drug as hyperthermic intraperitoneal chemotherapy.<sup>3524</sup>

Less than 10% oxaliplatin loss occurred in 2 hours in dextrose 5%.<sup>3524</sup> In phosphate buffer and Dianeal PD-4 with dextrose 1.36%, drug losses of less than 10% occurred within 30 minutes; however, losses exceeded 10% by 2 hours.<sup>3524</sup> In Ringer's injection, lactated and sodium chloride 0.9%, the solutions with the greatest chloride ion concentrations, drug losses exceeded 10% as early as 30 minutes and losses of 18 and 21%, respectively, occurred within 2 hours.<sup>3524</sup>

## Oxycodone Hydrochloride

AHFS 28:08.08

### Products

Oxycodone hydrochloride is available as a 10-mg/mL injection (equivalent to 9 mg of oxycodone base per mL) in 1- and 2-mL ampuls. Also present in the formulation are citric acid monohydrate, sodium citrate, sodium chloride, and hydrochloric acid and/or sodium hydroxide to adjust pH in water for injection.<sup>38</sup>

### Administration

Oxycodone hydrochloride is administered by subcutaneous or intravenous injection or infusion. For infusion, the drug may be

diluted to a concentration of 1 mg/mL in dextrose 5% or sodium chloride 0.9%.<sup>38</sup>

### Stability

Intact vials should be stored at controlled room temperature. The ampuls should be used immediately upon opening; unused portions should be discarded immediately. The manufacturer states that oxycodone hydrochloride diluted for infusion is stable for 24 hours under refrigeration.<sup>38</sup>

# Oxytocin

AHFS 76:00

## Products

Oxytocin is available in 1-mL single-use vials and 10-, 30-, and 50-mL multiple-dose vials.<sup>2856 2857 2858</sup> Each mL contains oxytocin 10 units with chlorobutanol 0.5%.<sup>2856 2857 2858</sup> Acetic acid may have been added to adjust the pH during manufacture.<sup>4 2856 2857 2858</sup>

## Units

One unit of oxytocin is equivalent to 2 to 2.2 mcg of pure oxytocin.<sup>4</sup>

## pH

The pH range is from 3 to 5.<sup>17 2858</sup>

## Trade Name(s)

Pitocin

## Administration

Oxytocin is administered by intravenous infusion using an infusion control device;<sup>4</sup> the drug may also be administered by intramuscular injection,<sup>2856 2857 2858</sup> although intramuscular injection is usually not recommended for induction or augmentation of labor because the drug's effects are unpredictable and difficult to control.<sup>4</sup>

For intravenous administration, the injection should be diluted to a usual concentration of 10 milliunits/mL by adding 10 units (1 mL) to 1000 mL of Ringer's injection, lactated, or sodium chloride 0.9%.<sup>4 2856 2857 2858</sup> A higher concentration range of 10 to 40 milliunits/mL in sodium chloride 0.9% or dextrose 5% has been cited for select indications.<sup>2856 2857 2858</sup>

## Stability

Oxytocin injection should be stored at controlled room temperature<sup>2856 2857 2858</sup> and protected from freezing.<sup>2858</sup> Do not use the solution if it is discolored or contains a precipitate.<sup>4 2856 2857 2858</sup> Discard unused portions of the drug.<sup>2857 2858</sup>

Oxytocin appears to be rapidly decomposed in the presence of sodium bisulfite.<sup>333</sup>

## Filtration

Oxytocin (Parke-Davis) 25 units/100 mL in dextrose 5% and sodium chloride 0.9% was filtered at about 3 mL/min through a 0.22- $\mu$ m cellulose ester membrane filter (Ivex-2). At this concentration, 25 times higher than normally used, oxytocin appeared to bind initially to the filter from the sodium chloride 0.9% solution. Results in dextrose 5% were equivocal. From these data, it is not possible to draw a definite conclusion regarding substantial binding of oxytocin during normal usage.<sup>533</sup>

## Paclitaxel

### AHFS 10:00

### Products

Paclitaxel is available as a 6-mg/mL non-aqueous concentrate for injection in 5-, 16.7-, 25-, and 50-mL multidose vials.<sup>3338 3339 3341</sup> In most formulations, each mL of the concentrate for injection also contains polyoxyl 35 castor oil (Cremophor EL; polyoxyethylated castor oil) surfactant 527 mg and dehydrated alcohol 396 mg.<sup>3338 3339</sup> Some formulations also incorporate citric acid anhydrous 2 mg/mL.<sup>3339</sup> The concentrate for injection must be diluted prior to administration.<sup>3338 3339</sup>

**CAUTION:** Care should be taken to ensure that the correct drug product, dose, and administration procedures are used and that no confusion with other products occurs. Although Abraxane, an albumin-bound paclitaxel suspension also exists,<sup>3219</sup> it is sufficiently different from conventional solvent-formulated paclitaxel that extrapolating information to or from it would be inappropriate.

### pH

The pH of paclitaxel (WG Critical Care) diluted for infusion ranges from 3 to 7.<sup>3342</sup>

### Trade Name(s)

Taxol

### Administration

Paclitaxel is administered by intravenous infusion.<sup>3338 3339</sup> The concentrate must be diluted to a final paclitaxel concentration of 0.3 to 1.2 mg/mL in dextrose 5%, sodium chloride 0.9%, dextrose 5% in sodium chloride 0.9%, or dextrose 5% in Ringer's injection.<sup>3338 3339</sup> Manufacturers note that the Chemo Dispensing Pin device or other similar devices with spikes should *not* be used with paclitaxel vials because they can cause the stopper to collapse, thereby resulting in loss of solution sterility.<sup>3338 3339</sup>

Administration of the diluted solution over 3 or 24 hours is often recommended, depending upon the indication and the specific regimen used.<sup>3338 3339</sup> An inline filter with a pore size not greater than 0.22  $\mu\text{m}$  should be used for administration of the diluted solution.<sup>3338 3339</sup> Intravenous solution containers and administration sets used should be free of the plasticizer diethylhexyl phthalate (DEHP) that may be leached from polyvinyl chloride (PVC) infusion bags or sets.<sup>3338 3339</sup> Diluted paclitaxel solutions preferably should be stored in glass, polypropylene, or polyolefin containers and administered through polyethylene-lined administration sets.<sup>3338 3339</sup> The infusion site should be monitored closely for possible infiltration during administration.<sup>3338 3339</sup>

As with other toxic drugs, caution should be exercised in the handling of paclitaxel.<sup>3338 3339</sup> The use of impervious gloves is always advised when handling vials of the drug.<sup>3338 3339</sup> If skin contact with paclitaxel occurs, the exposed area should be washed immediately and thoroughly with soap and water.<sup>3338 3339</sup>

For mucous membrane contact, the exposed area should be flushed thoroughly with water.<sup>3338 3339</sup> Procedures for the proper disposal of paclitaxel should be considered.<sup>3338 3339</sup>

Use of self-venting sets spiked into glass bottles of paclitaxel admixtures has occasionally resulted in solution dripping from the air vent. Presumably, the surfactant content wetted the hydrophobic filter, allowing the solution to drip.<sup>1843</sup> In another observation, the spikes of administration sets were made sufficiently slippery by surfactant in the paclitaxel formulation that the spike slipped out after it had been seated through the rubber bung of the glass bottle. The admixture also leaked due to a poor seal. The authors recommend use of non-PVC plastic solution containers to avoid the problem.<sup>2052</sup>

**CAUTION:** Care should be taken to ensure that the correct drug product, dose, and administration procedures are used and that no confusion with other products occurs.

### Stability

Paclitaxel is a clear, colorless to slightly yellow viscous solution.<sup>3338 3339</sup> Intact vials should be stored at controlled room temperature in the original package to protect from light.<sup>3338 3339</sup> Stability is not adversely affected by refrigeration or freezing.<sup>3338 3339</sup> Refrigeration may result in the precipitation of formulation components; however, warming to room temperature redissolves the material and does not adversely affect the product.<sup>3338 3339</sup> If the solution remains cloudy or an insoluble precipitate is noted, the product should be discarded.<sup>3338 3339</sup> Diluted paclitaxel solutions should be visually inspected for particulate matter and discoloration prior to administration.<sup>3338 3339</sup>

Paclitaxel 0.7 mg/mL diluted in sodium chloride 0.9% did not exhibit an antimicrobial effect on the growth of 3 of 4 organisms (*Enterococcus faecium*, *Staphylococcus aureus*, *Pseudomonas aeruginosa*, and *Candida albicans*) inoculated into the solution. *S. aureus* remained viable for 4 hours. *E. faecium* and *P. aeruginosa* remained viable for 48 hours, and *C. albicans* remained viable to the end of the study at 120 hours. Diluted solutions of paclitaxel should be stored under refrigeration whenever possible, and the potential for microbiological growth should be considered when assigning expiration periods.<sup>2160</sup>

### Turbidity

Paclitaxel is a clear, colorless to slightly yellow viscous solution.<sup>3338 3339</sup> After dilution in an infusion solution, the drug may exhibit haziness because of the surfactant content of the formulation.<sup>1528 3338 3339</sup>

### Precipitation

Although after dilution in specified infusion solutions, paclitaxel is physically and chemically stable for up to 27 hours<sup>3338 3339</sup> or longer,<sup>1746 1842 2708</sup> precipitation has occurred irregularly and unpredictably. Such precipitation occurs within the recommended range of 0.3 to 1.2 mg/mL and at lower paclitaxel

concentrations. These precipitates have been observed in the infusion tubing distal to the pump chamber.<sup>1716</sup> Although precipitation of insoluble drugs in an aqueous medium is a foregone conclusion, the time to precipitation is irregular. It may be accelerated by the presence or formation of crystallization nuclei, agitation, and contact with incompatible drugs or materials.<sup>1374</sup><sup>1521</sup> Since the mechanism of this irregular precipitation has not been identified,<sup>1739</sup> vigilance throughout the infusion of paclitaxel is required.

### Sorption

No paclitaxel loss due to sorption to containers or sets has been observed.<sup>1520 2230 2231 2232</sup>

### Plasticizer Leaching

Contact of undiluted paclitaxel concentrate with plasticized PVC equipment and devices is not recommended.<sup>3338 3339</sup> With use of infusion bags and tubing that are free of DEHP plasticizer and the elimination of PVC precision flow regulators, a reduction in leached DEHP of up to 96% has been reported.<sup>2679</sup>

Paclitaxel vehicle equivalent to paclitaxel 1.2 mg/mL in dextrose 5% in VISIV polyolefin bags was tested at room temperature near 23°C for 24 hours. No plastic components leached within the 24-hour study period.<sup>2660 2792</sup>

Paclitaxel itself does not contribute to the extraction of the plasticizer DEHP.<sup>1520</sup> However, the surfactant, Cremophor EL, in the paclitaxel formulation extracts DEHP from PVC containers and sets. The amount of DEHP extracted increases with time and drug concentration.<sup>1520 1683 2146</sup> Consequently, the use of DEHP-plasticized PVC containers and sets is not recommended for infusion of paclitaxel solutions.<sup>3338 3339</sup> Instead, manufacturers recommend the use of glass, polypropylene, or polyolefin containers and non-PVC containing administration sets (e.g., polyethylene-lined administration sets).<sup>3338 3339</sup>

The use of inline filters that incorporate short PVC-coated inlet and outlet tubing (e.g., Ivex-2) has not resulted in a substantial amount of DEHP leaching.<sup>3338 3339</sup>

A study was performed on the compatibility of paclitaxel 0.3- and 1.2-mg/mL infusions with various non-PVC infusion sets. The paclitaxel infusions were run through the study sets, and the effluent was then analyzed for leached DEHP plasticizer. The following sets had significant and unacceptable amounts of leached DEHP: Baxter vented nitroglycerin (2C7552S), Baxter vented basic solution (1C8355S), McGaw Horizon pump vented nitroglycerin (V7450), and McGaw Intelligent pump vented nitroglycerin (V7150). Although these sets were largely non-PVC, their highly plasticized pumping segments contributed the DEHP. The administration and extension sets cited in Tables 1 and 2 exhibited no more leached DEHP than the Ivex-2 filter set specified in the product labeling.<sup>1843</sup>

**Table 1. Administration sets compatible with paclitaxel infusions by manufacturer<sup>1843</sup>**

Abbott	LifeCare 5000 Plum PVC specialty set (11594)
Abbott	Life Shield anesthesia pump set OL with cartridge (13503)

Abbott	LifeCare model 4P specialty set, non-PVC (11434)
Abbott	Omni-Flow universal primary intravenous pump short minibore patient line (40527)
Baxter	Vented volumetric pump nitroglycerin set (2C1042)
Block Medical	Verifuse nonvented administration set with 0.22- $\mu$ m filter, check valve, injection site, and non-DEHP PVC tubing (V021015)
I-Flow	Vivus-4000 polyethylene-lined infusion set (5000-784)
IMED	Standard PVC set (9215)
IMED	Closed-system non-PVC fluid path nonvented quick-spike administration set (9635)
IMED	Non-PVC set with inline filter (9986)
IMED	Gemini 20 nonvented primary administration set for nitroglycerin and emulsions (2262)
IVAC	Universal set with low-sorbing tubing (52053, 59953, and 575053)
Ivion/Medex	WalkMed spike set (SP-06) with pump set (PS-401, PS-360, FPS-560, or FPX-560)
Siemens	Reduced-PVC full set MiniMed Uni-Set macrobore (28-60-190)

Ivion/Medex	Extension set with 0.22- $\mu$ m filter (IV4A07-IV3)
PALL	SetSaver extended-life disposable set with 0.2- $\mu$ m filter (ELD-96P and ELD-96LL)
PALL	SetSaver extended-life disposable microbore extension tubing with 0.2- $\mu$ m Posidyne filter (ELD-96LYL and ELD-96LYLN)
Pfizer/Strato Medical	Lifeport vascular-access system infusion set with Y-site (LPS 3009)

Paclitaxel 0.3 and 1.2 mg/mL was prepared in PVC bags in dextrose 5% and in sodium chloride 0.9%. Leaching of the plasticizer was found to be time and concentration dependent; however, there was little difference between the 2 infusion solutions. After storage for 8 hours at 21°C, leached DEHP in the range from 73 to 108 mcg/mL was found for the 1.2-mg/mL concentration and from 21 to 30 mcg/mL for the 0.3-mg/mL concentration. During a simulated 1-hour infusion using DEHP plasticized administration sets, the amount of leached DEHP did not exceed 18 mcg/mL at the 0.3-mg/mL paclitaxel concentration, but resulted in a maximum of 114 mcg/mL at the 1.2-mg/mL paclitaxel concentration.<sup>1825</sup>

DEHP plasticizer leaching from PVC containers and administration sets and the amount of DEHP leached was reported to depend on surfactant concentration and length of contact period. Authors also reported leaching of up to 30 mg of DEHP per dose from Flo-Gard Low Adsorption Sets (Baxter), a set with a reduced amount of PVC present in its construction.<sup>2146</sup>

In 1996, an acceptability limit of no more than 5 parts per million (5 mcg/mL) for DEHP plasticizer released from PVC-containing devices (e.g., containers, administration sets, other equipment) was proposed based on a review of metabolic and toxicologic considerations.<sup>2185</sup> FDA later evaluated the safety of DEHP exposure by comparing doses of DEHP received by patients undergoing various medical procedures with a defined tolerable intake value of DEHP, a value that was based upon the results of selected critical toxicity studies in experimental animals.<sup>3100</sup> Based on the results of the safety assessment, FDA concluded that there is little risk posed by exposure to the amount of DEHP released from PVC bags used to store and administer drugs that require an excipient for solubilization *when label instructions for preparation and administration are followed*.<sup>3100</sup> However, such conclusions do not take into account increased risk for adverse effects from DEHP exposure in certain patients (e.g., critically ill male neonates or infants, male infants less than 1 year of age, male offspring of pregnant or breast-feeding women undergoing certain medical treatments) or potential adverse effects related to aggregate exposure for patients exposed to multiple medical devices, procedures, or intravenous medications known to leach DEHP, for which there are varying levels of concern.<sup>3100 3101</sup>

Two reduced-phthalate administration sets for the Acclaim (Abbott) pump were evaluated. Administration set model 11993-48 (Abbott) is composed of polyethylene tubing but has

a DEHP-plasticized pumping segment. Administration set model L-12060 (Abbott) is composed of tris(2-ethylhexyl)trimellitate (TOTM)-plasticized PVC tubing and a DEHP-plasticized pumping segment. Paclitaxel diluent at concentrations equivalent to 0.3 and 1.2 mg/mL in dextrose 5% delivered rapidly over 3 hours at 23°C did not leach detectable levels of TOTM from model L-12060 or DEHP from either set. Similarly, slow delivery over 4 days of the 0.3-mg/mL concentration yielded detectable but not quantifiable amounts of plasticizer. However, slow delivery of the equivalent of 1.2 mg/mL over 4 days yielded large but variable amounts of DEHP from both sets; DEHP concentrations ranged from 30 to 150 mcg/mL. Consequently, these 2 reduced-phthalate sets are suitable for short-term delivery up to 3 hours of paclitaxel at concentrations up to 1.2 mg/mL. However, these sets should not be used for slow delivery of paclitaxel.<sup>2198</sup>

Paclitaxel vehicle equivalent to paclitaxel 0.3 and 1.2 mg/mL in dextrose 5% did not leach TOTM plasticizer from a TOTM-plasticized PVC set (SoloPak) during simulated 3-hour administration. During extremely slow delivery at 5.2 mL/hr for 4 days, no detectable TOTM was found in the 0.3-mg/mL equivalent concentration, and only a barely detectable, unquantifiable amount of TOTM was found with the 1.2-mg/mL equivalent solution.<sup>2232</sup>

Paclitaxel 0.3 and 1.2 mg/mL in dextrose 5% or in sodium chloride 0.9% in ethylene vinyl acetate (EVA) containers was found to leach an unknown material stored at 25 and 32°C for 24 hours.<sup>2182</sup>

### Filtration

The manufacturer recommends the use of an inline filter with a pore size not greater than 0.22  $\mu$ m for administration of diluted paclitaxel.<sup>3338 3339</sup> No substantial loss of paclitaxel due to filtration through an inline 0.22- $\mu$ m filter has occurred during simulated delivery.<sup>1520 3338 3339</sup>

The acceptability of the 0.22- $\mu$ m IV Express Filter Unit (Millipore) for the administration of paclitaxel was evaluated. Paclitaxel vehicle equivalent to paclitaxel 1.2 mg/mL (for plasticizer leaching) and paclitaxel 0.3 mg/mL (for sorption potential) in 500 mL of dextrose 5% in polyolefin containers was delivered through the filter units over a 3-hour period at a rate of 167 mL/hr at about 23°C to simulate paclitaxel administration. No leached plasticizer and no loss of paclitaxel due to sorption was found.<sup>2231</sup>

### Central Venous Catheter

The acceptability of the Arrow-Howes triple-lumen, 7 French, 30-cm polyurethane central catheter (Arrow International) for the administration of paclitaxel was evaluated. Paclitaxel vehicle equivalent to paclitaxel 0.3 and 1.2 mg/mL (for catheter component leaching) and paclitaxel 0.3 mg/mL (for sorption potential) were prepared in polyolefin bags of dextrose 5%. The solutions were delivered through the polyurethane central venous catheters for periods of 3 hours and of 24 hours at 23°C to simulate rapid and slow administration. No leached catheter components were found in the effluent solution and no loss of paclitaxel occurred.<sup>2230</sup>

## Compatibility Information

## Paclitaxel (albumin-bound)

AHFS 10:00

### Products

Albumin-bound paclitaxel is available as a white to yellow lyophilized powder or cake in single-use vials.<sup>3219</sup> Each vial contains 100 mg of paclitaxel formulated as albumin-bound nanoparticles (mean particle size of approximately 130 nm).<sup>3219</sup> Each vial contains human albumin 900 mg with sodium caprylate and sodium acetyltryptophanate.<sup>3219</sup>

**CAUTION: Care should be taken to ensure that the correct drug product, dose, and administration procedures are used and that no confusion with other products occurs.** Albumin-bound paclitaxel should not be substituted for or with other paclitaxel formulations.<sup>3219</sup>

The lyophilized powder or cake should be reconstituted by slowly (over at least 1 minute) injecting 20 mL of sodium chloride 0.9%, directing the stream of diluent onto the inside wall of the vial.<sup>3219</sup> The diluent should *not* be injected directly onto the lyophilized powder or cake as this will result in foaming.<sup>3219</sup> After injection of the full volume of the diluent, the vial should be allowed to stand for at least 5 minutes to ensure proper wetting of the powder or cake, after which point the vial should be gently swirled and/or inverted slowly for at least 2 minutes until complete powder or cake dissolution has occurred.<sup>3219</sup> Foam generation should be avoided; if foaming or clumping occurs, the reconstituted suspension should stand for at least 15 minutes until the foaming subsides.<sup>3219</sup>

The reconstituted albumin-bound paclitaxel suspension should be milky, homogenous, and free of visible particulates.<sup>3219</sup> If particulates are visible or settling occurs, the vial should be inverted gently again to ensure resuspension prior to use.<sup>3219</sup> If precipitates are observed, the suspension should be discarded.<sup>3219</sup>

Each mL of the reconstituted suspension contains 5 mg of paclitaxel.<sup>3219</sup> The appropriate dose of the drug should be withdrawn from the vial and injected into an empty plasticized polyvinyl chloride (PVC) container or a PVC or non-PVC type intravenous bag.<sup>3219</sup>

The use of medical devices (e.g., syringes, intravenous bags) containing silicone oil as a lubricant in the preparation and administration of albumin-bound paclitaxel may result in the formation of proteinaceous strands.<sup>3219</sup> Following transfer of the reconstituted suspension into the intravenous bag, the suspension should be visually inspected prior to administration; the suspension should be discarded if proteinaceous strands have formed or if particulate matter or discoloration is observed.<sup>3219</sup>

### Trade Name(s)

Abraxane

© Copyright, June 2017. American Society of Health-System Pharmacists, Inc.

### Administration

Albumin-bound paclitaxel suspension is administered by intravenous infusion over 30 or 30 to 40 minutes, depending upon the indication.<sup>3219</sup> The manufacturer states that limiting the infusion time to 30 minutes reduces the possibility of infusion-related reactions.<sup>3219</sup>

Extravasation of albumin-bound paclitaxel has been reported.<sup>3219</sup> The infusion site should be monitored closely for possible infiltration during administration.<sup>3219</sup>

As with other toxic drugs, caution should be exercised in the handling of albumin-bound paclitaxel.<sup>3219</sup> Manufacturers recommend the use of gloves.<sup>3219</sup> If skin contact with the lyophilized powder or cake or the reconstituted suspension occurs, the affected area(s) should be washed immediately and thoroughly with soap and water since tingling, burning, and redness may occur following topical exposure; for mucosal membrane contact, the affected area(s) should be flushed thoroughly with water.<sup>3219</sup> Procedures for the proper disposal of albumin-bound paclitaxel should be considered.<sup>3219</sup>

**CAUTION: Care should be taken to ensure that the correct drug product, dose, and administration procedures are used and that no confusion with other products occurs.**

### Stability

Intact vials should be stored at 20 to 25°C in the original package to protect from bright light; neither freezing nor refrigeration of the vials is noted to adversely affect stability.<sup>3219</sup>

Reconstituted albumin-bound paclitaxel suspension prepared in the vial should be used immediately, but may be stored for a maximum of 24 hours at 2 to 8°C when replaced in the original carton to protect from bright light.<sup>3219</sup> Reconstituted albumin-bound paclitaxel suspension transferred to an infusion bag also should be used immediately, but may be stored for a maximum of 24 hours at 2 to 8°C when protected from bright light.<sup>3219</sup> The time after reconstitution in the vial and after transfer to an infusion bag together should not exceed a combined time of 24 hours at 2 to 8°C; however, this refrigerated storage time may be followed by additional storage of the infusion bag at ambient temperature (approximately 25°C) and lighting conditions for a maximum of 4 hours.<sup>3219</sup>

Vials are for single use only; unused portions should be discarded.<sup>3219</sup>

### Plasticizer Leaching

Use of diethylhexyl phthalate (DEHP)-free containers or administration sets is *not* required for the preparation or administration of albumin-bound paclitaxel suspension.<sup>3219</sup>

## Palonosetron Hydrochloride

AHFS 56:22.20

### Products

Palonosetron is available as a 50-mcg/mL solution in 5-mL (0.25-mg) and 1.5-mL (0.075-mg) single-use vials containing palonosetron hydrochloride equivalent to palonosetron as the free base.<sup>2870</sup> Each mL of solution also contains mannitol 41.5 mg, disodium edetate, and citrate buffer in water for injection.<sup>2870</sup>

### Equivalency

Palonosetron hydrochloride 0.28 mg is equivalent to 0.25 mg of palonosetron as the free base.<sup>2870</sup>

### pH

From 4.5 to 5.5.<sup>2870</sup>

### Tonicity

Palonosetron hydrochloride injection is isotonic.<sup>2870</sup>

### Trade Name(s)

Aloxi

### Administration

Palonosetron hydrochloride injection is administered intravenously without dilution.<sup>2870</sup>

In adults, a dose should be administered over 10 or 30 seconds, depending upon the indication.<sup>2870</sup> Pediatric doses should be infused over 15 minutes.<sup>2870</sup>

The manufacturer states that the infusion line should be flushed with sodium chloride 0.9% prior to and following administration of palonosetron hydrochloride injection.<sup>2870</sup>

### Stability

Palonosetron hydrochloride injection is a clear, colorless solution.<sup>2870</sup> Intact vials of palonosetron hydrochloride injection should be stored at controlled room temperature and should be protected from light and freezing.<sup>2870</sup>

Palonosetron hydrochloride injection should be visually inspected for particulate matter or discoloration prior to administration.<sup>2870</sup>

## Pamidronate Disodium

AHFS 92:24

### Products

Pamidronate disodium is available as a concentrate for injection in 10-mL vials containing 30, 60, or 90 mg pamidronate disodium in 10 mL water for injection.<sup>2846 2847</sup> Each mL of solution also contains mannitol 47, 40, or 37.5 mg, respectively, and phosphoric acid and/or sodium hydroxide to adjust the pH.<sup>2846 2847</sup>

Pamidronate disodium is also available as a lyophilized powder in vials containing 30 or 90 mg of the drug.<sup>2847</sup> Reconstitute 30- or 90-mg vial with 10 mL sterile water for injection to yield solutions containing 3 or 9 mg/mL, respectively, of pamidronate disodium.<sup>2847</sup> Each mL of the resulting 3- or 9-mg/mL pamidronate disodium solution also contains mannitol 47 or 37.5 mg, respectively, and phosphoric acid for pH adjustment.<sup>2847</sup>

### pH

The injection concentrate has a pH of 6 to 7.<sup>2846 2847</sup>

The pH of the lyophilized product is adjusted to 6.5 prior to lyophilization.<sup>2847</sup> After reconstitution, the pH is 6 to 7.4.<sup>2847</sup>

### Trade Name(s)

Aredia

### Administration

Pamidronate disodium concentrate or reconstituted solution is administered by intravenous infusion over 2 to 24 hours after dilution in 250 to 1000 mL of a compatible diluent.<sup>2846 2847</sup>

### Stability

Intact vials of pamidronate disodium concentrate and lyophilized powder for injection should be stored at controlled room temperature.<sup>2846 2847</sup>

After the lyophilized pamidronate disodium powder for injection has been reconstituted as directed, the manufacturer states that the drug may be stored under refrigeration for up to 24 hours.<sup>2847</sup>

## Pancuronium Bromide

AHFS 12:20.20

### Products

Pancuronium bromide is available in 2- and 5-mL vials containing 2 mg/mL of drug.<sup>2871</sup> It is also available in 10-mL vials at a concentration of 1 mg/mL.<sup>2871 2872</sup> Each mL (Hospira) also contains sodium acetate anhydrous 1.2 mg, benzyl alcohol 1%, and sodium chloride to adjust for isotonicity.<sup>2872</sup> Each mL (Teva) also contains sodium acetate anhydrous 2 mg, benzyl alcohol 1%, sodium chloride 4 mg for isotonicity, and water for injection.<sup>2871</sup> Acetic acid and/or sodium hydroxide is added to adjust the pH.<sup>2871 2872</sup>

### pH

The solution has been adjusted to pH 3.8 to 4.2 by the manufacturer.<sup>2871 2872</sup>

### Osmolality

The osmolality of pancuronium bromide (Organon) 1 mg/mL was determined to be 277 mOsm/kg by freezing-point depression and 273 mOsm/kg by vapor pressure.<sup>1071</sup>

The osmolality of pancuronium bromide 2 mg/mL was determined to be 338 mOsm/kg.<sup>1233</sup>

### Administration

Pancuronium bromide is administered intravenously.<sup>2871 2872</sup>

### Stability

Pancuronium bromide should be stored under refrigeration at 2 to 8°C.<sup>2871 2872</sup> However, the manufacturer indicates that the drug is stable for 6 months at room temperature.<sup>853 1181 1433 2871 2872</sup>

### Sorption

The manufacturer indicates that pancuronium bromide in compatible infusion solutions does not undergo sorption to glass or plastic containers during short-term storage over 48 hours.<sup>2871 2872</sup> However, the drug may exhibit sorption to plastic containers with prolonged contact.<sup>4</sup>

## Compatibility Information

## Pantoprazole Sodium

AHFS 56:28.36

### Products

Pantoprazole sodium is available as a lyophilized powder in single-dose vials containing pantoprazole 40 mg as the sodium salt with edetate disodium 1 mg and sodium hydroxide to adjust pH during manufacturing.<sup>2850 3358</sup>

Pantoprazole sodium also is available as a lyophilized powder in single-dose vials containing pantoprazole 40 mg as the sodium salt with sodium hydroxide to adjust pH during manufacturing.<sup>3357</sup>

Reconstitute a 40-mg vial with 10 mL of sodium chloride 0.9% to a concentration of 4 mg/mL.<sup>2850 3357 3358</sup> For intravenous infusion, 1 vial (40 mg) of the reconstituted drug solution may be diluted with 100 mL or 2 vials (80 mg) may be diluted with 80 mL of sodium chloride 0.9%, dextrose 5%, or Ringer's injection, lactated to yield concentrations of about 0.4 or 0.8 mg/mL, respectively.<sup>2850 3357 3358</sup>

### pH

The pH of the reconstituted solution ranges from 9 to 10.5<sup>2850 3358</sup> or from 9.5 to 11.5.<sup>3357</sup>

### Equivalency

Pantoprazole sodium 45.1 mg provides 40 mg of pantoprazole.<sup>2850 3357 3358</sup>

### Trade Name(s)

Protonix I.V.

### Administration

Pantoprazole sodium injection reconstituted as directed to a concentration of 4 mg/mL may be administered by intravenous infusion over a period of at least 2 minutes.<sup>2850 3357 3358</sup> The reconstituted solution also may be diluted in a compatible infusion solution to a concentration of about 0.4 or 0.8 mg/mL and administered by intravenous infusion over about 15 minutes.<sup>2850 3357 3358</sup> Manufacturers state that pantoprazole sodium injection is only for intravenous infusion and that other parenteral routes of administration are not recommended.<sup>2850 3357 3358</sup>

The drug also has been administered as an intravenous bolus, followed by continuous intravenous infusion administered at a rate of 8 mg/hr.<sup>3359 3360</sup>

Pantoprazole sodium injection should be administered intravenously through a dedicated intravenous line or Y-site.<sup>2850 3357 3358</sup> The intravenous line used to administer the drug should be flushed with dextrose 5%, sodium chloride 0.9%, or Ringer's injection, lactated prior to and following pantoprazole sodium administration.<sup>2850 3357 3358</sup>

Administration of pantoprazole sodium formulations containing edetate disodium has been associated with thrombophlebitis.<sup>2850 3358</sup>

Caution should be used when formulations of pantoprazole sodium injection containing edetate disodium are co-administered intravenously with other drugs containing EDTA.<sup>2850 3358</sup> (See Stability.)

### Stability

Intact vials of pantoprazole sodium should be stored at controlled room temperature and should be protected from light during storage.<sup>2850 3357 3358</sup>

After reconstitution as directed, pantoprazole sodium injection may be stored for up to 6 hours at room temperature before dilution or 24 hours at room temperature if administered without dilution.<sup>2850 3357 3358</sup> Manufacturers note that the reconstituted<sup>2850 3357 3358</sup> and diluted solutions<sup>3357</sup> should not be frozen.

After dilution in a compatible infusion solution, the drug must be used within 24 hours from the time of initial reconstitution when stored at room temperature.<sup>2850 3357 3358</sup>

Reconstituted and diluted solutions of pantoprazole sodium should be visually inspected for particulate matter and discoloration prior to and during administration.<sup>2850 3357 3358</sup> Protection from light exposure is not required for reconstituted or diluted solutions.<sup>2850 3357 3358</sup>

Some formulations of pantoprazole sodium injection contain edetate disodium, the salt form of EDTA.<sup>2850 3358</sup> Edetate disodium may chelate metal ions (e.g., zinc), and therefore some formulations of pantoprazole sodium injection may not be compatible with products containing zinc.<sup>2850 3358</sup> Caution should be used when formulations of the drug containing edetate disodium are co-administered intravenously with other drugs containing EDTA.<sup>2850 3358</sup>

Pantoprazole sodium admixtures prepared for infusion did not undergo discoloration over 24 hours at room temperature when exposed to light;<sup>2507</sup> however, solutions have been noted to develop a slight yellow shade that is more apparent in more highly concentrated solutions over periods of up to 28 days.<sup>2851</sup> This color change did not appear to be associated with decomposition of the drug.<sup>2851</sup>

### pH Effects

The stability of pantoprazole in solution is pH dependent; the rate of degradation of the drug increases with decreasing pH.<sup>2850 3357 3358</sup>

### Syringes

Reconstituted pantoprazole sodium (Wyeth) 4 mg/mL in sodium chloride 0.9% in polypropylene syringes (Terumo) has been found to be physically and chemically stable for at least 96 hours at room temperature of 24°C when exposed to light and when refrigerated at 4°C.<sup>2656</sup>

# Papaverine Hydrochloride

AHFS 24:12.92

## Products

Papaverine hydrochloride is available in 2-mL single-dose ampuls and vials and 10-mL multiple-dose vials. Each mL of solution contains 30 mg of papaverine as the hydrochloride.<sup>1(2/06) 4</sup> The multiple-dose vials also contain edetate disodium 0.005%, chlorobutanol 0.5%, and sodium hydroxide to adjust the pH.<sup>1(2/06)</sup> The single-dose containers are preservative free.<sup>4</sup>

### pH

Not below 3.<sup>17</sup>

## Administration

Papaverine hydrochloride may be administered by intramuscular or slow intravenous injection over one to two minutes.<sup>1(2/06) 4</sup>

## Stability

Papaverine hydrochloride injection should be stored at controlled room temperature and protected from light, temperatures of 40°C or higher, and from freezing.<sup>1(2/06) 4</sup> It should not be refrigerated because of a reduction in solubility with possible precipitation.<sup>593</sup> The solutions should be clear and colorless to pale yellow.<sup>1(2/06)</sup> The yellow discoloration of papaverine hydrochloride injection does not appear to be related to drug decomposition. Analysis of a yellow injection found nearly 100% of the drug. Furthermore, yellow discoloration is not produced by intentional degradation from boiling with acid or base.<sup>1996</sup>

## Pemetrexed Disodium

### AHFS 10:00

### Products

Pemetrexed disodium is available in single-dose vials containing 100 or 500 mg of pemetrexed as the disodium salt.<sup>3396</sup> Vials also contain mannitol 106 or 500 mg, respectively.<sup>3396</sup> Hydrochloric acid and/or sodium hydroxide may have been added to adjust pH.<sup>3396</sup>

Each 100- or 500-mg vial of pemetrexed should be reconstituted with 4.2 or 20 mL, respectively, of sodium chloride 0.9% (without preservatives) and swirled gently until the powder is completely dissolved to yield a 25-mg/mL solution.<sup>3396</sup> Calcium-containing solutions should not be used for reconstitution.<sup>3396</sup> The reconstituted solution should be visually inspected for particulate matter and discoloration prior to dilution; if particulate matter is present, the vial should be discarded.<sup>3396</sup> The appropriate dose of the reconstituted solution must be diluted with additional sodium chloride 0.9% (without preservatives) to achieve a total volume of 100 mL.<sup>3396</sup>

### Equivalency

Pemetrexed disodium 139.8 mg as the heptahydrate is equivalent to 100 mg of pemetrexed.<sup>3396</sup> Pemetrexed disodium 699 mg as the heptahydrate is equivalent to 500 mg of pemetrexed.<sup>3396</sup>

### Trade Name(s)

Alimta

### Administration

Pemetrexed disodium diluted for infusion should be administered by intravenous infusion over 10 minutes.<sup>3396</sup>

As with other toxic drugs, caution should be exercised in the handling and preparation of pemetrexed and applicable special handling and disposal procedures should be followed.<sup>3396</sup>

### Stability

Pemetrexed disodium is a white to light-yellow or green-yellow powder that forms a clear, colorless to yellow or green-yellow

solution upon reconstitution.<sup>3396</sup> Intact vials of pemetrexed disodium should be stored at controlled room temperature.<sup>3396</sup> The reconstituted solution and the diluted solution for infusion may be stored for up to 24 hours after reconstitution at 2 to 8°C.<sup>3396</sup> Any unused portions should be discarded.<sup>3396</sup>

Pemetrexed (Lilly) 9 mg/mL in sodium chloride 0.9% did not result in the loss of viability of *Pseudomonas aeruginosa* within 120 hours at room temperature of 22°C. A slight antimicrobial effect against *Staphylococcus aureus* was reported after 120 hours at room temperature; this slight effect cannot be regarded as sufficient for patient protection from growth of this microorganism. Diluted solutions should be stored under refrigeration whenever possible, and the potential for microbiological growth should be considered when assigning expiration periods.<sup>2740</sup>

Pemetrexed (Lilly) 25 mg/mL reconstituted with sodium chloride 0.9% was reported to be stable for 48 hours at 23°C exposed to or protected from light and for 31 days at 4°C exhibiting little or no drug loss when packaged in polypropylene syringes (Becton Dickinson) with Red Cap tip seals (Burrton).<sup>2676</sup>

### Freezing Solutions

Pemetrexed (Lilly) 2 to 20 mg/mL in dextrose 5% and also in sodium chloride 0.9% frozen at -20°C in polyvinyl chloride (PVC) bags developed substantial amounts of microparticulates, up to 30,000/mL, at all time points in the study up to 90 days. Especially concerning was the presence of hundreds of particles of 10 µm and larger, which may adversely impact patient safety. Although little loss of the drug occurred, the formation of such large quantities of microparticulates made the solutions unacceptable for use. The microparticulates that formed appeared to be related to the PVC containers because upon repeating the study in glass laboratory vessels, few microparticulates appeared.<sup>2693</sup>

## Penicillin G Potassium

AHFS 8:12.16.04

### Benzylpenicillin Potassium

#### Products

Penicillin G potassium is available in vial sizes of 5 million and 20 million units.<sup>1(2/08)</sup> The commercial products contain sodium citrate and citric acid as buffers. Depending on the route of administration, reconstitute the vials with sterile water for injection, dextrose 5%, or sodium chloride 0.9%. The recommended reconstitution volumes may vary slightly among manufacturers; the amount of diluent recommended by the manufacturer should be used for reconstitution. To reconstitute the product, loosen the powder in the vials. While holding the vial horizontally, rotate it and add the diluent slowly, directing the stream against the wall of the vial. Shake the vial vigorously. When the required volume of solvent is greater than the capacity of the vial, a portion of the total volume of diluent may be added to the vial first to dissolve the drug. The resulting solution should then be withdrawn and mixed with the remainder of the needed diluent in a larger container.<sup>1(2/08) 4</sup>

Penicillin G potassium is also available as frozen premixed infusion solutions of 1, 2, and 3 million units in 50 mL of dextrose 4, 2.3, and 0.7%, respectively. The products also contain sodium citrate buffer; hydrochloric acid and/or sodium hydroxide may have been used to adjust the pH during manufacture.<sup>1(2/08)</sup>

#### Units

Each milligram of penicillin G potassium has 1440 to 1680 USP units. Each milligram of the powder for injection (which contains sodium citrate buffer) has 1355 to 1595 USP units.<sup>4</sup>

#### pH

The reconstituted powder for injection has a pH of 6 to 8.5.<sup>1(2/08)</sup> The frozen premixed infusion solutions have a pH of 5.5 to 8.<sup>1(2/08) 4</sup>

#### Osmolality

The frozen premixed penicillin G potassium infusion solutions are iso-osmotic with an osmolality of 300 mOsm/kg.<sup>1(2/08)</sup>

The osmolality of penicillin G potassium (Pfizer) 250,000 units/mL in sterile water for injection was determined to be 776 mOsm/kg by freezing-point depression and 767 mOsm/kg by vapor pressure.<sup>1071</sup> Another report cited the osmolality of this concentration as 749 mOsm/kg.<sup>50</sup>

The osmolality of penicillin G potassium 50,000 units/mL was 402 mOsm/kg in dextrose 5% and 414 mOsm/kg in sodium chloride 0.9%. At 100,000 units/mL, the osmolality was 535 mOsm/kg in dextrose 5% and 554 mOsm/kg in sodium chloride 0.9%.<sup>1375</sup>

The osmolality of penicillin G potassium was calculated for the following dilutions:<sup>1054</sup>

Diluent	Osmolality (mOsm/kg)	
	50 mL	100 mL
<b>3 million units</b>		
Dextrose 5%	411	340
Sodium chloride 0.9%	437	367
<b>5 million units</b>		
Dextrose 5%	501	394
Sodium chloride 0.9%	527	420

The following maximum penicillin G potassium concentrations were recommended to achieve osmolalities suitable for peripheral infusion in fluid-restricted patients:<sup>1180</sup>

Diluent	Maximum Concentration (units/mL)	Osmolality (mOsm/kg)
Dextrose 5%	81,568	566
Sodium chloride 0.9%	73,455	545
Sterile water for injection	147,205	513

#### Sodium and Potassium Content

Penicillin G potassium contains, in each million units, 1.7 mEq of potassium and 0.3 mEq of sodium.<sup>1(2/08)</sup>

#### Administration

NOTE: Do not confuse other forms of penicillin G with penicillin G potassium.

Penicillin G potassium is administered by intramuscular injection or continuous or intermittent intravenous infusion. It may also be administered by intrathecal, intra-articular, and intrapleural injections and other local instillations. Vials containing 20 million units are intended for intravenous administration. For intramuscular injections, concentrations of up to 100,000 units/mL will cause a minimum of discomfort. Higher concentrations may be used when needed.<sup>1(2/08) 4</sup>

In high doses, intravenous administration should be performed slowly to avoid electrolyte imbalance from the potassium content. For daily doses of 10 million units or more, the drug may be diluted in 1 or 2 L of infusion solution and administered in a 24-hour period. By intermittent intravenous infusion, one-fourth or one-sixth of the daily dose may be given over 1 to 2 hours and repeated every 6 to 4 hours, respectively. Divided doses are generally infused over 15 to 30 minutes in children and neonates.<sup>4</sup>

## Stability

The drug powder is stable at room temperature. After reconstitution, the drug is stable for 7 days under refrigeration.<sup>1(2/08) 4</sup>

However, penicillin G potassium 500,000 units/mL was stored at room temperature and 4°C. After 24 hours at room temperature, a new compound formed, which increased by 72 hours. Storage at 4°C substantially reduced the rate of formation. Although the activity of penicillin G potassium was retained over the time period, its potential as an antigen may change due to formation of polymers or conjugation products that may cause allergic reactions. It was recommended that the drug be freshly prepared before use or refrigerated during storage.<sup>785</sup>

Another study found increased formation of specific antipenicillin antibodies in patients administered aged penicillin solutions, not only at room temperature, but also 4°C. The causative antigens were degradation or transformation products of penicillin G. Freshly prepared solutions did not seem to be immunogenic.<sup>946</sup>

## pH Effects

The stability of penicillin G potassium 500,000 units/mL is greatest at pH 7.<sup>160</sup> Penicillin G activity rapidly declines at pH 5.5 and below and at pH values above 8.<sup>47</sup>

Penicillin G potassium is both an acid- and alkali-labile drug. It should not be mixed with drugs that may result in a final pH outside of its stability range of pH 5.5 to 8.<sup>47</sup> Unfortunately, the citrate buffer is of little value in the presence of strongly acidic or alkaline drugs.<sup>48</sup>

The times to 10% decomposition of combinations of penicillin G potassium buffered with multivitamin infusion concentrate in dextrose 5% and sodium chloride 0.9% have been calculated on the basis of the final pH of the admixture.<sup>304</sup>

Penicillin G Potassium	Multivitamin Infusion Concentrate	pH	Time to 10% Decomposition
1 million units/L	1 mL/L	5.1	6.51 hr
1 million units/L	5 mL/L	4.9	4.56 hr
3 million units/L	1 mL/L	5.4	13.54 hr
3 million units/L	5 mL/L	5	6.38 hr
5 million units/L	1 mL/L	5.7	22.01 hr
5 million units/L	5 mL/L	5.1	6.51 hr
10 million units/L	1 mL/L	5.9	over 24 hr
10 million units/L	5 mL/L	5.4	13.54 hr

## Freezing Solutions

Frozen premixed infusion solutions of penicillin G potassium are stable for at least 90 days from shipping stored at -20°C. The frozen solutions should be thawed at room temperature or under refrigeration and, once thawed, should not be refrozen. Thawing should not be performed using a warm water bath or microwave radiation. Thawed solutions are stated to be stable for 24 hours at room temperature and for 14 days under refrigeration.<sup>4</sup>

Penicillin G potassium 1 million units/100 mL of dextrose 5% in polyvinyl chloride (PVC) bags was frozen at -20°C for 30 days and then thawed by exposure to ambient temperature or microwave radiation. No evidence of precipitation or color change was observed, and a 3 to 4% loss was reported. The thawed solution at room temperature was physically compatible and exhibited no further loss over 24 hours.<sup>554</sup>

A fivefold increase in particles of 2 to 60 µm was produced by freezing and thawing penicillin G potassium (Squibb) 2 million units/100 mL of dextrose 5% (Travenol). The constituted drug was filtered through a 0.45-µm filter into PVC bags of solution and frozen for 7 days at -20°C. Thawing was performed at 29°C for 12 hours. Although the total number of particles increased significantly, no particles greater than 60 µm were observed; the solutions complied with USP standards for particle sizes and numbers in large volume parenteral solutions.<sup>822</sup>

Penicillin G potassium 1 million units/50 mL of sodium chloride 0.9% lost 5% in 16 days and 7% in 25 days when frozen at -7°C. However, samples of the same solution stored at 4°C showed similar results, indicating a lack of advantage for frozen storage.<sup>1035</sup>

## Ambulatory Pumps

The stability of penicillin G potassium 100,000 and 200,000 units/mL in sterile water for injection was evaluated in PVC portable pump reservoirs (Pharmacia Deltec). A 6% loss occurred in 3 days at 25°C. The 200,000-unit/mL concentration was also tested stored at 5°C. A 3% loss occurred in 14 days.<sup>2080</sup>

## Elastomeric Reservoir Pumps

Penicillin G potassium (Pfizer) 40,000 units/mL in both dextrose 5% and sodium chloride 0.9% was evaluated for binding potential to natural rubber elastomeric reservoirs (Baxter). No binding was found after storage for 2 weeks at 35°C with gentle agitation.<sup>2014</sup>

## Filtration

Filtering penicillin G potassium (Pfizer) through 5-µm stainless steel and 0.22-µm cellulose ester inline filters resulted in no significant reduction in activity under conditions of varying doses, temperatures, flow rates, and administration methods.<sup>167</sup>

**Additional Compatibility Information****Peritoneal Dialysis Solutions**

The activity of penicillin G 6 mg/L was evaluated in peritoneal dialysis fluids containing dextrose 1.5 and 4.25% (Dianeal 137, Travenol). Storage at 25°C resulted in about a 25% loss of antimicrobial activity in 24 hours. The loss of activity was attributed to the pH (5.2) of the dialysis fluids.<sup>515</sup>

However, penicillin G potassium (Parke-Davis) 500,000 units/L in peritoneal dialysis concentrate (Travenol) containing dextrose 30% with and without heparin sodium 2500 units/L underwent substantial reduction in activity within as little as 10 minutes.<sup>273</sup>

## Penicillin G Sodium

AHFS 8:12.16.04

### Benzylpenicillin Sodium

#### Products

Penicillin G sodium is available in vials containing 5 million units of drug with sodium citrate and citric acid as buffers. Depending on the route of administration, reconstitute the vials with sterile water for injection, dextrose 5%, or sodium chloride 0.9%; reconstitution of the 5 million-unit vial with 3 or 8 mL of diluent results in a final concentration of 1 million or 500,000 units/mL, respectively. Loosen the powder in the vial; while holding the vial horizontally, rotate it, and add the diluent slowly, directing the stream against the wall of the vial. Shake the vial vigorously.<sup>1(11/06) 4</sup>

#### Units

Each milligram of penicillin G sodium has 1500 to 1750 USP units. Each milligram of the powder for injection (which contains sodium citrate buffer) has 1420 to 1667 USP units.<sup>4</sup>

#### pH

From 5 to 7.5.<sup>1(11/06)</sup>

#### Osmolality

Penicillin G sodium 250,000 units/mL in sterile water for injection has an osmolality of 795 mOsm/kg.<sup>50</sup>

The osmolality of penicillin G sodium was calculated for the following dilutions:<sup>1054</sup>

Diluent	Osmolality (mOsm/kg)	
	50 mL	100 mL
<b>3 million units</b>		
Dextrose 5%	413	341
Sodium chloride 0.9%	439	368
<b>5 million units</b>		
Dextrose 5%	502	394
Sodium chloride 0.9%	529	421

The following maximum penicillin G sodium concentrations were recommended to achieve osmolalities suitable for peripheral infusion in fluid-restricted patients:<sup>1180</sup>

Diluent	Maximum Concentration (units/mL)	Osmolality (mOsm/kg)
Dextrose 5%	85,383	573
Sodium chloride 0.9%	76,891	563
Sterile water for injection	154,091	545

#### Sodium Content

Penicillin G sodium contains 1.68 mEq of sodium per million units.<sup>1(11/06)</sup>

#### Administration

NOTE: Do not confuse other forms of penicillin G with penicillin G sodium.

Penicillin G sodium is administered by intramuscular injection or by continuous or intermittent intravenous infusion. For intramuscular injections, concentrations of up to 100,000 units/mL will cause a minimum of discomfort. Higher concentrations may be used when needed. In high doses, intravenous administration should be performed slowly to avoid electrolyte imbalance from the sodium content. For daily doses of 10 million units or more, the drug may be diluted in 1 or 2 L of infusion solution and administered in a 24-hour period. By intermittent intravenous infusion, one-fourth or one-sixth of the daily dose may be given over 1 to 2 hours and repeated every 6 to 4 hours, respectively. Divided doses are generally infused over 15 to 30 minutes in children and neonates.<sup>4</sup>

#### Stability

The dry powder may be stored at controlled room temperature. After reconstitution, solutions may be stored for 3 days<sup>1(11/06)</sup> to 7 days<sup>4</sup> under refrigeration. Intravenous infusions containing this drug are stable at room temperature for at least 24 hours.<sup>4</sup>

The activity of penicillin G 6 mg/L was evaluated in peritoneal dialysis fluids containing dextrose 1.5 and 4.25% (Dianeal 137, Travenol). Storage at 25°C resulted in about a 25% loss of antimicrobial activity in 24 hours. The loss of activity was attributed to the pH (5.2) of the dialysis fluids.<sup>515</sup>

#### pH Effects

At 25°C, the maximum stability of penicillin G sodium is attained at pH 6.8,<sup>131</sup> but little difference in the rate of decomposition occurs in the pH range of 6.5 to 7.5.<sup>1947</sup> Not more than 10% loss occurs in 24 hours in a pH range of 5.4 to 8.5.<sup>131</sup> Unbuffered penicillin G sodium injection 12 and 48 mg/mL in sodium chloride 0.9% had an initial pH between 5.4 and 5.8. A 7% loss occurred in 2 days in samples stored at 5°C. However, reconstituting with citrate buffers having pH values of 6.5, 7, and 7.5 resulted in great stability improvement. At these same concentrations in sodium chloride 0.9% in minibags stored at 5°C, losses of 5 to 7% occurred in 28 days and 10% in 56 days.<sup>1671</sup>

#### Freezing Solutions

It has been shown that penicillin G sodium in concentrations of 1 to 10%, buffered to pH 6.85, loses not more than 1% in 1 month when frozen at -20°C.<sup>99</sup> Another report stated that solutions

of penicillin G sodium at a concentration of 50,000 units/mL in water, sodium chloride 0.9%, and 0.05 M citrate buffer and also at a concentration of 500,000 units/mL with sodium citrate 15 mg are stable for at least 12 weeks when frozen at  $-25^{\circ}\text{C}$ . At  $-5^{\circ}\text{C}$  in the citrate buffer, the rate of decomposition is considerably higher than at either  $-25$  or  $5^{\circ}\text{C}$ .<sup>156</sup>

Penicillin G sodium 2.5 million units/50 mL of dextrose 5% in PVC containers was physically compatible and stable for 39 days frozen at  $-20^{\circ}\text{C}$ . Subsequent thawing and storage at  $4^{\circ}\text{C}$  resulted in a 3 to 4% loss in 10 to 15 days and up to a 10% loss in 31 days.<sup>1125</sup>

Little penicillin G sodium loss occurred in a solution containing 180,000 units/mL in sterile water for injection in PVC and glass containers after 30 days at  $-20^{\circ}\text{C}$ . Subsequent thawing and storage for 4 days at  $5^{\circ}\text{C}$ , followed by 24 hours at  $37^{\circ}\text{C}$  to simulate the use of a portable infusion pump, resulted in about a 12 to 16% penicillin loss.<sup>1391</sup>

### Ambulatory Pumps

The stability of penicillin G sodium 100,000 and 200,000 units/mL in sterile water for injection was evaluated in PVC portable pump reservoirs (Pharmacia Deltec). A 4 to 6% loss occurred in 3 days at  $25^{\circ}\text{C}$ .<sup>2080</sup>

<sup>a</sup> Tested in dextrose 5%.

<sup>b</sup> Run at 21 mL/hr.

<sup>c</sup> Given over five minutes by syringe pump.

<sup>d</sup> Run at 94 mL/hr.

<sup>e</sup> Refer to Appendix for the composition of parenteral nutrition solutions. TPN indicates a 2-in-1 admixture.

<sup>f</sup> Tested in sodium chloride 0.9%.

## Pentamidine Isethionate

AHFS 8:30.92

### Products

Pentamidine isethionate is available as a lyophilized powder in single-dose vials containing 300 mg of the salt.<sup>3311</sup> For intramuscular injection, the vial contents should be reconstituted with 3 mL of sterile water for injection at 22 to 30°C.<sup>3311</sup> For intravenous administration, the vial contents should be reconstituted with 3 to 5 mL of sterile water for injection or dextrose 5% at 22 to 30°C; then the dose should be withdrawn from the vial and further diluted in 50 to 250 mL of dextrose 5% for administration.<sup>3311</sup>

Sodium chloride 0.9% should *not* be used initially to reconstitute pentamidine isethionate because precipitation will occur.<sup>3311</sup>

### pH

From 4.5 to 7.5.<sup>3312</sup>

### Equivalency

Pentamidine isethionate 1.74 mg is equivalent to pentamidine 1 mg.<sup>3315 3316</sup> Care should be taken to clarify upon which moiety (i.e., salt or base) a dosage is expressed and to ensure that no confusion exists with other pentamidine salts.<sup>3314 3315 3316</sup>

### Trade Name(s)

Pentam 300

### Administration

Pentamidine isethionate injection may be administered by intravenous infusion or deep intramuscular injection.<sup>3311</sup> Regardless of the route of administration, patients receiving the drug should be in the supine position and their blood pressure should be monitored closely during administration and several times thereafter until the blood pressure has stabilized.<sup>3311</sup>

For intravenous infusion, the calculated dose should be diluted in 50 to 250 mL of dextrose 5% prior to administration and infused over 60 to 120 minutes.<sup>3311</sup> The drug should *not* be administered by rapid intravenous injection or infusion.<sup>3311</sup>

Extravasation of pentamidine isethionate may cause ulceration, tissue necrosis, and/or sloughing at the site of injection.<sup>3311</sup> The intravenous needle or catheter must be properly positioned and closely observed throughout administration.<sup>3311</sup> If extravasation occurs, the injection should be discontinued immediately and restarted in another vein.<sup>3311</sup>

### Stability

Intact vials of powder should be stored at controlled room temperature and protected from light.<sup>3311</sup>

Reconstituted solutions prepared with sterile water for injection are stable for 48 hours in the original vial at room temperature if protected from light.<sup>3311</sup> Reconstituted solutions should be stored at 22 to 30°C to avoid crystallization.<sup>3311</sup> Solutions for intravenous infusion prepared in dextrose 5% containing pentamidine isethionate 1 and 2.5 mg/mL are stable for up to 24 hours at room temperature.<sup>3311</sup> Because no preservative is present, the manufacturer recommends discarding any remaining solution.<sup>3311</sup>

Solutions should be visually inspected for particulate matter and discoloration prior to administration.<sup>3311</sup>

Pentamidine isethionate (Fresenius Kabi) 0.8 to 98 mg/mL in sterile water for injection in polyvinyl chloride (PVC) bags and glass vials has been reported to be stable for 30 days at 4°C.<sup>3312</sup>

### Freezing Solutions

The manufacturer states that pentamidine isethionate solutions should be stored at 22 to 30°C to avoid crystallization.<sup>3311</sup>

Pentamidine isethionate (Fresenius Kabi) 1 to 30 mg/mL in dextrose 5% and sterile water for injection in PVC bags has been reported to be stable for 90 days at -20°C.<sup>3312</sup> Pentamidine isethionate (Fresenius Kabi) 0.8 to 2.5 mg/mL in dextrose 5% in PVC bags has been reported to be stable for 120 days at -20°C.<sup>3312</sup>

Pentamidine isethionate (Fresenius Kabi) 0.8 to 98 mg/mL in dextrose 5% and sterile water for injection in glass vials has been reported to be stable for 90 days at -20°C.<sup>3312</sup>

### Syringes

Pentamidine isethionate (Fresenius Kabi) 0.8 to 97 mg/mL in dextrose 5% and sterile water for injection packaged in disposable plastic syringes has been reported to be stable for 30 days at 4°C and 120 days at -20°C.<sup>3312</sup>

### Elastomeric Reservoir Pumps

Pentamidine isethionate (Fujisawa) 3 mg/mL in dextrose 5% and 2 mg/mL in sodium chloride 0.9% was evaluated for binding potential to natural rubber elastomeric reservoirs.<sup>2014</sup> No binding was found after storage for 2 weeks at 35°C with gentle agitation.<sup>2014</sup>

### Sorption

One study that demonstrated stability of pentamidine isethionate (Lyphomed) 1 or 2 mg/mL in dextrose 5% or sodium chloride 0.9% for 48 hours at 22 to 26°C in PVC bags also demonstrated losses of 2 or 10% when 2-mg/mL solutions in dextrose 5% or sodium chloride 0.9%, respectively, were infused through a PVC infusion set, potentially suggesting adsorption of the drug to the set.<sup>1142</sup>

## Pentazocine Lactate

AHFS 28:08.12

### Products

Pentazocine lactate is supplied in 1-mL ampuls, 1- and 2-mL syringe cartridges, and 10-mL multiple-dose vials. Each mL of solution contains<sup>1(10/06)</sup>:

Component	Ampul	Cartridge Unit	Vial
Pentazocine (as lactate)	30 mg	30 mg	30 mg
Sodium chloride	2.8 mg	2.2 mg	1.5 mg
Acetone sodium bisulfite		1 mg	2 mg
Methylparaben			1 mg
Water for injection	qs 1 mL	qs 1 mL	qs 1 mL

### pH

The pH is adjusted to 4 to 5 with lactic acid or sodium hydroxide.<sup>1(10/06)</sup>

### Osmolality

The osmolality of pentazocine lactate 30 mg/mL was determined to be 307 mOsm/kg.<sup>1233</sup>

### Trade Name(s)

Talwin

### Administration

Pentazocine lactate may be administered by intramuscular, subcutaneous, or intravenous injection. For repeated administration, intramuscular injection with constant rotation of the injection sites should be used. Subcutaneous injection should be used only when necessary because of possible tissue damage.<sup>1(10/06) 4</sup>

### Stability

Pentazocine lactate injection should be stored at controlled room temperature<sup>1(10/06)</sup> and protected from temperatures of 40°C or above and from freezing. Pentazocine lactate is incompatible with alkaline substances.<sup>4</sup>

### Syringes

Pentazocine lactate (Winthrop) 30 mg/1 mL, repackaged in 3-mL clear glass syringes (Hy-Pod) and stored at 25°C, exhibited no significant changes in pH, physical appearance, or drug concentration during 360 days of storage.<sup>535</sup>

## Pentobarbital Sodium

AHFS 28:24.04

### Products

Pentobarbital sodium 50 mg/mL is available in 20- and 50-mL multiple-dose vials. Each mL of solution also contains propylene glycol 40% (v/v), alcohol 10%, and hydrochloric acid and/or sodium hydroxide to adjust pH in water for injection.<sup>1(3/07)</sup>

### pH

Adjusted to approximately 9.5;<sup>1(3/07)</sup> range 9 to 10.5.<sup>17</sup>

### Trade Name(s)

Nembutal

### Administration

Pentobarbital sodium may be administered by deep intramuscular injection into a large muscle or by slow intravenous injection. The rate of intravenous administration should not exceed 50 mg/min. No more than 5 mL of solution (250 mg) should be injected intramuscularly at any one site.<sup>1(3/07)</sup><sup>4</sup>

### Stability

Intact vials of pentobarbital sodium should be stored at controlled room temperature and protected from excessive heat and freezing. Brief exposures to temperatures up to 40°C does not adversely affect the product.<sup>1(3/07)</sup>

Aqueous solutions of pentobarbital sodium are not stable. The commercially available pentobarbital sodium in a propylene

glycol vehicle is more stable. In an acidic medium, pentobarbital sodium may precipitate.<sup>4</sup> No solution containing a precipitate or that is cloudy should be used.<sup>1(3/07)</sup><sup>4</sup>

Pentobarbital sodium may raise the pH of admixture solutions to the alkaline range and, therefore, should not be mixed with alkali-labile drugs.<sup>47</sup>

### Syringes

Pentobarbital sodium 50 mg/mL was packaged in 1-mL glass and polypropylene syringes and 3-mL polypropylene syringes (Becton Dickinson) and stored at 25°C. No loss occurred in 31 days.<sup>2429</sup>

### Sorption

Pentobarbital sodium did not undergo sorption to a polyvinyl chloride (PVC) plastic test strip or PVC infusion solution bag.<sup>12</sup><sup>770</sup>

### Plasticizer Leaching

Pentobarbital sodium 2 mg/mL in dextrose 5% did not leach diethylhexyl phthalate (DEHP) plasticizer from 50-mL PVC bags in 24 hours at 24°C.<sup>1683</sup>

### Filtration

Pentobarbital sodium 600 mg/L and 1.25 g/L in dextrose 5% and also sodium chloride 0.9% was filtered through a 0.45- $\mu$ m filter. The delivered concentration did not decrease.<sup>754</sup>

## Pentostatin

### AHFS 10:00

#### Products

Pentostatin is available as a lyophilized powder in vials containing 10 mg of drug. Also present are 50 mg of mannitol and sodium hydroxide or hydrochloric acid to adjust the pH. Reconstitute the vial contents with 5 mL of sterile water for injection and shake well to yield a 2-mg/mL solution.<sup>1(8/07)</sup>

#### pH

From 7 to 8.5.<sup>1(8/07)</sup>

#### Trade Name(s)

Nipent

#### Administration

Pentostatin is administered intravenously by injection over five minutes or by infusion over 20 to 30 minutes when diluted in 25 to 50 mL of dextrose 5% or sodium chloride 0.9%. Adequate hydration is necessary prior to administering pentostatin. Administration of 500 to 1000 mL of dextrose 5% in sodium chloride 0.45% or similar solution prior to drug administration with an additional 500 mL of dextrose 5% or similar solution after drug administration is recommended.<sup>1(8/07) 4</sup>

#### Stability

The manufacturer recommends that pentostatin be stored under refrigeration,<sup>1(8/07)</sup> but other information indicates that the drug in intact vials is stable for at least three years at room temperature.<sup>234</sup>

The white to off-white powder yields a colorless solution when reconstituted. The manufacturer states that reconstituted pentostatin solutions are stable at room temperature for up to eight hours only because of the absence of antibacterial preservatives.<sup>1(8/07)</sup> Other information indicates that the reconstituted solution is stable for 72 hours at room temperature, exhibiting a 2 to 4% loss.<sup>234 1453</sup>

Pentostatin (Parke-Davis) 0.03 mg/mL diluted in sodium chloride 0.9% and stored at 22°C did not exhibit a substantial antimicrobial effect on the growth of four organisms (*Enterococcus faecium*, *Staphylococcus aureus*, *Pseudomonas aeruginosa*, and *Candida albicans*) inoculated into the solution. *C. albicans* maintained viability for 24 hours, and the others were viable for 48 to 120 hours. The author recommended that diluted solutions of pentostatin be stored under refrigeration whenever possible and that the potential for microbiological growth be considered when assigning expiration periods.<sup>2160</sup>

#### pH Effects

Pentostatin displays greater decomposition under acidic conditions compared to alkaline conditions. The pH range of maximum stability is about 6.5 to 11.5. At pH 6 to 8, hydrolysis is not sensitive to the ionic strength of the solution.<sup>1453</sup>

#### Sorption

Pentostatin does not undergo sorption to PVC containers or administration sets at concentrations between 0.18 and 0.33 mg/mL in dextrose 5% or sodium chloride 0.9%.<sup>1(8/07)</sup>

## Peramivir

AHFS 8:18.28

### Products

Peramivir injection is available as a concentrate in single-use vials containing peramivir 10 mg/mL (on the anhydrous basis) in sodium chloride 0.9%.<sup>2960</sup> Sodium hydroxide and/or hydrochloric acid may have been added to adjust the pH.<sup>2960</sup>

#### pH

From 5.5 to 8.5.<sup>2960</sup>

#### Tonicity

Peramivir injection is isotonic.<sup>2960</sup>

#### Trade Name(s)

Rapivab

### Administration

Peramivir is administered by intravenous infusion over 15 to 30 minutes after dilution of the injection concentrate to a maximum of 100 mL with a compatible infusion solution.<sup>2960</sup> (See Solution Compatibility.)

### Stability

Peramivir injection concentrate should be clear and colorless.<sup>2960</sup> Intact vials should be stored at controlled room temperature and retained in the original carton.<sup>2960</sup>

Visually inspect peramivir injection for particulate matter or discoloration prior to use.<sup>2960</sup>

Single-use vials of peramivir do not contain any preservatives.<sup>2960</sup> Diluted solutions should be used immediately or stored for up to 24 hours under refrigeration; any unused portion should be discarded after 24 hours.<sup>2960</sup> If refrigerated, diluted solutions should be allowed to come to room temperature and then administered immediately.<sup>2960</sup>

#### Sorption

Peramivir injection is stated to be compatible with materials commonly used for administration (e.g., PVC bags, PVC-free bags, polypropylene syringes, polyethylene tubing).<sup>2960</sup>

## Pertuzumab

AHFS 10:00

### Products

Pertuzumab is available as a preservative-free solution at a concentration of 30 mg/mL in 420-mg single-use vials.<sup>3091</sup> Each vial also contains L-histidine acetate 20 mM, sucrose 120 mM, and polysorbate 20 0.02%.<sup>3091</sup>

Vials of pertuzumab should be visually inspected for particulate matter and discoloration.<sup>3091</sup> To prepare a solution for infusion, the appropriate dose of the solution should be diluted in 250 mL of sodium chloride 0.9% in a polyvinyl chloride (PVC) or polyolefin bag; dextrose 5% should *not* be used.<sup>3091</sup> The infusion bag should be gently inverted to mix the diluted solution.<sup>3091</sup> The diluted solution should not be shaken.<sup>3091</sup>

### pH

6.<sup>3091</sup>

### Trade Name(s)

Perjeta

### Administration

Pertuzumab is administered only by intravenous infusion following dilution in 250 mL of sodium chloride 0.9%.<sup>3091</sup> Doses of 840 mg should be infused over 60 minutes; doses of 420 mg should be infused over 30 to 60 minutes.<sup>3091</sup> Pertuzumab should *not* be administered by intravenous push or bolus injection.<sup>3091</sup>

### Stability

Intact vials of pertuzumab should be stored at 2 to 8°C in the outer carton to protect from light until time of use.<sup>3091</sup> The drug should not be frozen or shaken.<sup>3091</sup>

The manufacturer recommends that diluted solutions of pertuzumab be used immediately once prepared; however, diluted solutions may be stored at 2 to 8°C for up to 24 hours when prepared as directed.<sup>3091</sup> The manufacturer states that pertuzumab should not be mixed with other drugs.<sup>3091</sup>

## Phenobarbital Sodium

AHFS 28:12.04

### Products

Phenobarbital sodium injection is available in various dosage forms and sizes, including 30, 60, 65, and 130 mg/mL, from several manufacturers. The product formulations also contain ethanol 10%, propylene glycol 67.8 to 75%, and water for injection. Some products also contain benzyl alcohol 1.5% as a preservative.<sup>1(2/08) 4</sup>

### pH

The USP cites the official pH range as 9.2 to 10.2.<sup>17</sup>

### Osmolality

The osmolality of phenobarbital sodium 65 mg/mL was 15,570 mOsm/kg by freezing-point depression and 9285 mOsm/kg by vapor pressure.<sup>1071</sup> The osmolality of phenobarbital sodium 200 mg/mL was 10,800 mOsm/kg.

The osmolality of phenobarbital sodium 100 mg was calculated for the following dilutions:<sup>1054</sup>

Diluent	Osmolality (mOsm/kg)	
	50 mL	100 mL
Dextrose 5%	296	289
Sodium chloride 0.9%	325	317

### Trade Name(s)

Luminal Sodium

### Administration

Phenobarbital sodium is administered by intramuscular injection into a large muscle and slow intravenous injection. The commercial injection is highly alkaline and may cause local tissue damage. Do not administer subcutaneously. When given intravenously, the rate of injection should not exceed 60 mg/min.<sup>1(2/08) 4</sup>

## Compatibility Information

### Solution Compatibility

#### Phenobarbital sodium

Test Soln Name	Mfr	Mfr	Conc/L or %	Remarks	Ref	C/I
Dextrose 2.5% in half-strength Ringer's injection	AB		320 mg	Physically compatible	3	C
Dextrose 5% in Ringer's injection	AB		320 mg	Physically compatible	3	C

### Stability

Phenobarbital sodium injection in intact containers should be stored at controlled room temperature and protected from light.<sup>1(2/08)</sup>

Phenobarbital sodium under simulated summer conditions in paramedic vehicles was exposed to temperatures ranging from 26 to 38°C over 4 weeks. Analysis found no loss of the drug under these conditions.<sup>2562</sup>

Phenobarbital sodium is not generally considered stable in aqueous solutions.<sup>4</sup> However, a test of phenobarbital sodium 10% (w/v) in aqueous solution showed 7% decomposition in 4 weeks when stored at 20°C. There was no measurable decomposition in 8 weeks with storage at -25°C.<sup>233</sup>

In addition, the stability of phenobarbital sodium diluted to a 10-mg/mL concentration in sodium chloride 0.9% for use in infants was studied. When stored at 4°C, the dilution was physically compatible with no loss of drug over 28 days.<sup>1294</sup>

Phenobarbital may precipitate from solutions of phenobarbital sodium, depending on the concentration and acidic pH.<sup>4</sup> No solution containing a precipitate or that is more than slightly discolored should be used.<sup>1(2/08) 4</sup>

Phenobarbital sodium may raise the pH of admixture solutions to the alkaline range and, therefore, should not be mixed with alkali-labile drugs.<sup>47</sup>

### Plasticizer Leaching

Phenobarbital sodium 6 mg/mL in dextrose 5% did not leach diethylhexyl phthalate (DEHP) plasticizer from 50-mL polyvinyl chloride (PVC) bags in 24 hours at 24°C.<sup>1683</sup>

### Filtration

Phenobarbital sodium 130 mg/L in dextrose 5%, sodium chloride 0.9%, and Ringer's injection, lactated filtered over 12 hours through a 5-µm stainless steel depth filter (Argyle Filter Connector), a 0.22-µm cellulose ester membrane filter (Ivex-2 Filter Set), and a 0.22-µm polycarbonate membrane filter (In-Sure Filter Set), showed no loss due to binding to the filters.<sup>320</sup>

## Phentolamine Mesylate

AHFS 12:16.04.04

### Products

Phentolamine mesylate is available in vials containing 5 mg of drug with 25 mg of mannitol as a lyophilized powder. Reconstitution with 1 mL of sterile water for injection results in a 5-mg/mL solution.<sup>1(4/06) 4</sup>

### pH

From 4.5 to 6.5.<sup>4</sup>

### Administration

Phentolamine mesylate may be administered by intramuscular or intravenous injection.<sup>1(4/06) 4</sup>

### Stability

The intact vials should be stored at controlled room temperature.<sup>1(4/06) 4</sup> Although the manufacturer recommends that reconstituted solutions be used immediately and not stored,<sup>1(4/06)</sup> other information indicates that such solutions are stable for 48 hours at room temperature and one week at 2 to 8°C.<sup>4</sup>

### Sorption

Phentolamine mesylate was shown not to exhibit sorption to PVC bags and tubing, polyethylene tubing, Silastic tubing, and polypropylene syringes.<sup>536 606</sup>

# Phenylephrine Hydrochloride

AHFS 12:12.04

## Products

Phenylephrine hydrochloride is available as a 1% solution in 1-mL single-use vials and 5- and 10-mL pharmacy bulk vials.<sup>3051</sup><sup>3052</sup> Each mL of solution contains phenylephrine hydrochloride 10 mg with sodium citrate dihydrate 4 mg, citric acid monohydrate 1 mg, sodium chloride 3.5 mg, and sodium metabisulfite 2 mg in water for injection.<sup>3051</sup> <sup>3052</sup> The pH may have been adjusted with sodium hydroxide and/or hydrochloric acid during manufacturing.<sup>3051</sup> <sup>3052</sup>

Pharmacy bulk vials should only be used in the preparation of solutions for continuous infusion.<sup>3052</sup>

## pH

The 10% solution of phenylephrine (West-Ward) has a pH ranging from 3 to 6.5.<sup>3051</sup> The 10% solution of Vazculep has a pH ranging from 3.5 to 5.5.<sup>3052</sup>

## Trade Name(s)

Vazculep

## Administration

Phenylephrine hydrochloride is administered by intravenous bolus injection or by continuous intravenous infusion.<sup>3051</sup> <sup>3052</sup> For intravenous bolus injection, a 100-mcg/mL solution from which the bolus injection is withdrawn should be prepared by diluting 1 mL (10 mg) of phenylephrine hydrochloride with 99 mL of dextrose 5% or sodium chloride 0.9%.<sup>3051</sup> <sup>3052</sup> For continuous intravenous infusion, 1 mL (10 mg) of phenylephrine hydrochloride should be added to 500 mL of dextrose 5% or sodium chloride 0.9% to yield a final concentration of 20 mcg/mL.<sup>3051</sup> <sup>3052</sup>

## Stability

Intact vials of phenylephrine hydrochloride should be stored at controlled room temperature and protected from light by storing in the original carton until time of use.<sup>3051</sup> <sup>3052</sup>

The diluted solution should be visually inspected for particulate matter and discoloration prior to use; the solution should not be used if it is colored or cloudy or contains particulate matter.<sup>3051</sup> <sup>3052</sup>

Once the closure of the pharmacy bulk vial has been penetrated with a suitable sterile transfer set or dispensing set that allows the measured dispensing of the vial contents, the vial should not be re-entered, and dispensing from the vial should be completed within 4 hours.<sup>3052</sup> Any unused portion should be discarded.<sup>3052</sup>

Phenylephrine hydrochloride was stable for 84 days at 60°C in a 250-mg/100-mL concentration in sterile water for injection.<sup>132</sup>

Phenylephrine hydrochloride in dextrose 5% is stated to be stable for at least 48 hours at pH 3.5 to 7.5.<sup>4</sup>

## Syringes

Phenylephrine hydrochloride (Gensia Sicor) 0.1 mg/mL packaged in polypropylene plastic syringes fitted with tip seals and stored at 23 to 25°C in fluorescent light and at 3 to 5°C and at -20°C in the dark for 30 days exhibited no precipitation, cloudiness, or color change and virtually no loss of drug.<sup>2737</sup>

## Central Venous Catheter

Phenylephrine hydrochloride (Ohmeda) 1 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

## Phenytoin Sodium

AHFS 28:12.12

### Products

Phenytoin sodium is available as a 50-mg/mL solution in 2- and 5-mL single-dose vials.<sup>3376</sup> Each mL of solution also contains propylene glycol 40% (v/v) and alcohol 10% (v/v) in water for injection.<sup>3376</sup> Sodium hydroxide may have been added to adjust the pH.<sup>3376</sup>

**CAUTION: Care should be taken to avoid confusion between phenytoin sodium and fosphenytoin sodium to prevent dosing errors.**<sup>3280</sup>

### pH

From 10 to 12.3.<sup>3376</sup>

### Osmolality

The osmolality of phenytoin sodium 50 mg/mL was 9740 mOsm/kg by freezing-point depression and 6175 mOsm/kg by vapor pressure.<sup>1071</sup> Another report indicated that the osmolality was 3035 mOsm/kg by freezing-point depression.<sup>1233</sup>

The osmolality of phenytoin sodium 500 mg in 50 and 100 mL of sodium chloride 0.9% was calculated to be 336 and 312 mOsm/kg, respectively.<sup>1054</sup>

### Administration

Phenytoin sodium is preferably administered intravenously, directly into a large peripheral or central vein through a large-gauge catheter.<sup>3376</sup> Prior to administration, patency of the intravenous catheter should be tested with a flush of sodium chloride.<sup>3376</sup> Following each intravenous administration of phenytoin sodium, the same catheter used to administer the drug should be flushed with sodium chloride to avoid irritation caused by the alkalinity of the phenytoin sodium formulation.<sup>3376</sup>

For the treatment of status epilepticus, a loading dose of phenytoin sodium should be administered intravenously *slowly*.<sup>3376</sup> For adults, the manufacturer recommends administration of phenytoin sodium at a rate not exceeding 50 mg/min.<sup>3376</sup> For pediatric patients, the manufacturer recommends administration of phenytoin sodium at a rate not exceeding 1 to 3 mg/kg/min or 50 mg/min, whichever is slower.<sup>3376</sup> The intramuscular route of administration should not be used in the treatment of status epilepticus.<sup>3376</sup>

For non-emergent indications, phenytoin sodium should be administered more slowly, either as a loading dose or by intermittent intravenous infusion.<sup>3376</sup> When administered as an intravenous infusion, phenytoin sodium solution should be diluted in sodium chloride 0.9% to a final phenytoin sodium concentration no less than 5 mg/mL.<sup>3376</sup> Administration of phenytoin sodium solution diluted in sodium chloride 0.9% should begin immediately after dilution through an inline filter with a pore size of 0.22 to 0.55  $\mu\text{m}$ .<sup>3376</sup>

Although phenytoin sodium also may be administered by intramuscular injection, it can cause pain, necrosis, and

abscess formation at the injection site and can result in erratic or delayed absorption of the drug.<sup>3376</sup> The manufacturer states that the drug generally should *not* be administered intramuscularly because of these risks.<sup>3376</sup> In addition, the intramuscular route of administration should not be used in the treatment of status epilepticus.<sup>3376</sup>

Purple glove syndrome, characterized by edema, discoloration, and pain distal to the site of infusion, has been reported following intravenous administration of phenytoin sodium through a peripheral vein and may or may not be associated with extravasation.<sup>3376</sup>

### Stability

Intact vials should be stored at controlled room temperature.<sup>3376</sup> If the undiluted solution is refrigerated or frozen, a precipitate may form; however, this precipitate will dissolve upon standing at room temperature.<sup>3376</sup> On dissolution of the precipitate, the product is still suitable for use.<sup>3376</sup> Also, a faint yellow color, which has no effect on concentration, may sometimes develop in the injection.<sup>3376</sup>

Phenytoin sodium solution diluted for infusion should *not* be refrigerated.<sup>3376</sup> Infusion of phenytoin sodium solution diluted in sodium chloride 0.9% should begin immediately after dilution and must be completed within 1 to 4 hours after preparation.<sup>3376</sup>

Phenytoin sodium solution should be visually inspected for particulate matter and discoloration prior to administration.<sup>3376</sup> Any unused portions should be discarded.<sup>3376</sup>

### Precipitation

The solubility of phenytoin sodium is such that crystallization or precipitation may result if the special vehicle is altered or the pH is lowered.<sup>62 63 613</sup> Unfortunately, direct intravenous injection of phenytoin sodium is inconvenient due to limitations on the rate of administration, and rapid administration increases the risk of severe adverse cardiovascular effects.<sup>3376</sup> In spite of the caveat against dilution, some clinicians have advocated the infusion of phenytoin sodium<sup>443 448 611 947 948 949 950 1295</sup> or administration into the tubing of a running infusion solution.<sup>63 65 338 445</sup>

There are a number of reports of phenytoin crystallization in infusion solutions within varying periods after dilution. While the time to crystal formation may be variable and difficult to predict, crystal formation is nonetheless inevitable.<sup>65 66 305 306 447 449 450 451 708 709 710 1421</sup>

The relationship of phenytoin sodium solubility to various solution characteristics was explored. It was noted that the effect of the special solvent system could be disregarded in dilutions of 1:5 or more. The pH of the admixture was stated to be the primary determinant of the occurrence or absence of crystallization. With a given solution, the pH is dependent on the volume of dilution, with a lower pH resulting from greater dilution. Phenytoin becomes less soluble in aqueous solution

as the pH drops. Equations for predicting the compatibility of phenytoin sodium in admixture solutions were presented, but it was noted that it is not possible to predict the time required to develop precipitation.<sup>713</sup>

Although some may feel that infusion of phenytoin sodium is, perhaps, too dangerous to perform clinically,<sup>452</sup> others indicate that such administration may be feasible provided proper precautions are taken such as using a suitable vehicle (i.e., sodium chloride 0.9% or Ringer's injection, lactated), using a sufficiently concentrated solution, starting the infusion immediately after preparation and completing administration within a relatively short time, using a 0.22- $\mu$ m inline filter, and watching the admixture very carefully.<sup>305 306 453 611 612 613 708 709 710 947 948 949 950 1295</sup>

Phenytoin may precipitate if the injection is mixed with dextrose or dextrose-containing solutions; mixing with these solutions should be avoided.<sup>3376</sup> Such precipitation has been found to occlude catheters. Instilling 5 mL of 8.4% sodium bicarbonate injection at 15- to 30-minute intervals has cleared catheters occluded with phenytoin precipitate. The sodium bicarbonate apparently raised the pH enough to result in dissolution of a sufficient amount of the phenytoin precipitate to

reopen the catheter;<sup>2299 2300</sup> however, the safety is uncertain because it is not known if some of the precipitated phenytoin is delivered into the bloodstream upon opening the occlusion.

### Sorption

Phenytoin sodium was shown not to exhibit sorption to polyvinyl chloride (PVC) bags and tubing, polyethylene tubing, Silastic tubing, and polypropylene syringes.<sup>536 606</sup>

### Plasticizer Leaching

Phenytoin sodium 10 mg/mL in sodium chloride 0.9% did not leach diethylhexyl phthalate (DEHP) plasticizer from 50-mL PVC bags in 24 hours at 24°C.<sup>1683</sup>

### Filtration

The manufacturer recommends the use of an inline filter with a pore size of 0.22 to 0.55  $\mu$ m for administration of phenytoin sodium solution diluted for infusion.<sup>3376</sup>

Phenytoin sodium 250 mg/5 mL was filtered at a rate of 1 mL/min through a 5- $\mu$ m stainless steel depth filter (Argyle Filter Connector). No reduction due to binding to the filter was observed.<sup>320</sup>

## Phytonadione

AHFS 88:24

### Phytomenadione

### Products

Phytonadione is available as a 2-mg/mL aqueous dispersion in 0.5-mL ampuls and as a 10-mg/mL aqueous dispersion in 1-mL ampuls and 5-mL vials. Each mL also contains polyoxyethylated fatty acid 70 mg, dextrose 37.5 mg, and benzyl alcohol 0.9% in water for injection.<sup>1(8/06)</sup>

### pH

The USP cites the official pH range as 3.5 to 7.<sup>17</sup> Phytonadione (Hospira) has a pH of 5 to 7.<sup>1(8/06)</sup>

### Osmolality

The osmolality of phytonadione 10 mg/mL was 325 mOsm/kg by freezing-point depression and 303 mOsm/kg by vapor pressure.<sup>1071</sup>

### Administration

The intramuscular or subcutaneous routes are preferred for phytonadione. If intravenous injection is unavoidable, phytonadione may be given by direct intravenous injection at a rate not exceeding 1 mg/min or by intravenous infusion.<sup>1(8/06) 4</sup>

### Stability

Phytonadione injection is available as an essentially clear yellow liquid. Phytonadione is photosensitive and should be protected from light at all times.<sup>1(8/06) 4</sup> When dilutions are indicated, administration should start immediately after mixing with the diluent; unused portions of the dilution, as well as unused contents of the ampul, should be discarded.<sup>4</sup>

### Light Effects

A study of phytonadione in intravenous solutions showed 50% decomposition in 15 days under fluorescent light and 43 to 63%

in three hours on exposure to sunlight.<sup>463</sup> A 10 to 15% loss occurs over 24 hours on exposure to fluorescent light or sunlight.<sup>854</sup> It has been recommended that infusion solutions containing phytonadione require wrapping the container with aluminum foil or other opaque material for light protection.<sup>4</sup>

The loss of phytonadione (Roche) 0.05 to 0.1 mg/mL from solutions in glass and polypropylene containers unprotected or packaged in light-protective overwraps when exposed to neon light and daylight was evaluated. Losses approached 80% in one day unprotected from light exposure. A brown polyethylene light protection bag provided the best protection, yielding no phytonadione loss during a seven-day exposure period. A white "light-tight" light-protective overwrap and a black plastic waste disposal bag failed to protect the phytonadione completely. In the black bag, phytonadione losses of over 30% occurred in seven days; the white light-protective overwrap was worse, allowing loss of nearly half of the phytonadione in one day. Substantial differences in light protection are afforded by the different materials and the efficacy of purported light-protection barriers for light-sensitive drugs should be validated prior to use.<sup>1923</sup>

Substantial loss of phytonadione from both TPN and TNA admixtures due to exposure to sunlight was reported. In three hours of exposure to sunlight, 50% loss of phytonadione had occurred. The presence or absence of lipids did not affect stability.<sup>2049</sup>

### Filtration

The manufacturer states that phytonadione passes through an inline filter with negligible loss occurring.<sup>854</sup>

# Piperacillin Sodium–Tazobactam Sodium

AHFS 8:12.16.16

## Products

The fixed combination of piperacillin sodium–tazobactam sodium is available as a lyophilized powder in preservative-free single-dose and ADD-Vantage vials containing 2.25 g (piperacillin 2 g plus tazobactam 250 mg), 3.375 g (piperacillin 3 g plus tazobactam 375 mg), or 4.5 g (piperacillin 4 g plus tazobactam 500 mg) as the sodium salts.<sup>2918 2919 2921</sup> The drug is also available in a pharmacy bulk package containing 40.5 g (piperacillin 36 g plus tazobactam 4.5 g) as the sodium salts.<sup>2918 2920</sup>

Generic piperacillin sodium–tazobactam sodium and Zosyn (Wyeth) products are *not* identical.<sup>2922 2932</sup> In 2006, all Zosyn products were reformulated to contain edetate disodium dihydrate (EDTA) as a metal chelator and sodium citrate as a buffering agent; these excipients were added to address issues with sporadic batch failures associated with excessive particulate matter related to commercially available diluents and solutions with acidic pH and the presence of trace amounts of zinc ions.<sup>2922 2932</sup> Other piperacillin sodium–tazobactam sodium products do not contain EDTA, sodium citrate, or any other excipients.<sup>2919 2920 2921</sup> These formulation differences between Zosyn products and other piperacillin sodium–tazobactam sodium products have been demonstrated to result in some differing compatibilities with certain solutions (e.g., Ringer's injection, lactated).<sup>2922 2932 2985</sup> Therefore, results of compatibility tests for one formulation cannot be extrapolated to another.<sup>2922 2932</sup> (See Solution Compatibility.)

Each 2.25, 3.375, or 4.5 g (combined components) single-dose vial should be reconstituted with 10, 15, or 20 mL, respectively, of sterile water for injection, sodium chloride 0.9%, bacteriostatic water for injection or bacteriostatic sodium chloride 0.9% (preserved with benzyl alcohol or parabens), or dextrose 5% and should be swirled until dissolved.<sup>2918 2921</sup> The contents of each single-dose vial should then be diluted in 50 to 150 mL of a compatible infusion solution; however, if sterile water for injection is used as the diluent, the maximum recommended volume per dose is 50 mL.<sup>2918 2921</sup>

ADD-Vantage vials of piperacillin sodium–tazobactam sodium should be prepared with 50 or 100 mL of dextrose 5% or sodium chloride 0.9% in ADD-Vantage diluent bags.<sup>2919</sup>

The 40.5-g pharmacy bulk package should be reconstituted with 152 mL of sterile water for injection, sodium chloride 0.9%, bacteriostatic water for injection or bacteriostatic sodium chloride 0.9% (preserved with benzyl alcohol or parabens), or dextrose 5% and should be shaken until dissolved; the resulting solution contains piperacillin 200 mg/mL plus tazobactam 25 mg/mL.<sup>2918 2920</sup> The reconstituted pharmacy bulk package solution must be diluted further in a compatible infusion solution; the recommended volume per dose is 50 to 100 mL,<sup>2918 2920 2922</sup> however, if sterile water for injection is used as the diluent, the maximum recommended volume per dose is 50 mL.<sup>2918 2920 2922</sup>

Piperacillin sodium–tazobactam sodium (Zosyn, Wyeth) also is available as a frozen iso-osmotic premixed injection in single-dose Galaxy containers containing piperacillin 40 mg/mL plus tazobactam 5 mg/mL or piperacillin 60 mg/mL plus tazobactam 7.5 mg/mL, as well as EDTA and sodium citrate dihydrate, in water for injection.<sup>2918 2922</sup> Dextrose hydrous is added to adjust the osmolality, and sodium bicarbonate and hydrochloric acid are used to adjust the pH.<sup>2918 2922</sup>

## pH

Zosyn (Wyeth) products: From 5.5 to 6.8.<sup>2918 2922</sup>

## Sodium Content

Zosyn (Wyeth) products contain 2.79 mEq (64 mg) of sodium per gram of piperacillin in the combination product.<sup>2918</sup>

Generic piperacillin sodium–tazobactam sodium products contain 2.35 mEq (54 mg) of sodium per gram of piperacillin in the combination product.<sup>2919 2920 2921</sup>

## Trade Name(s)

Zosyn

## Administration

Piperacillin–tazobactam solution for infusion prepared from single-dose vials or the pharmacy bulk package should be administered by intravenous infusion over at least 30 minutes after dilution in a compatible diluent to provide a recommended volume per dose of 50 to 150 mL.<sup>2918 2920 2921</sup> Such solutions for infusion prepared using single-dose vials or the pharmacy bulk package also can be infused using ambulatory infusion pumps.<sup>2918 2920 2921</sup>

Piperacillin sodium–tazobactam sodium (Zosyn, Wyeth) frozen iso-osmotic premixed injection in single-dose Galaxy containers should be thawed (see Stability: Freezing Solutions), and the solution should be administered by intravenous infusion over at least 30 minutes.<sup>2918</sup>

Use of extended infusion strategies (e.g., infusion over 4 hours) for piperacillin–tazobactam has been described in the literature.<sup>2934</sup> In such circumstances, however, careful attention must be paid to the possibility of incomplete dose administration resulting from drug loss through tubing residuals.<sup>2934</sup> Such loss is a function of both the concentration of the solution being infused and the residual volume of the specific tubing used for administration.<sup>2934</sup>

## Stability

The white to off-white<sup>2918 2920 2921</sup> or yellowish<sup>2919</sup> piperacillin sodium–tazobactam sodium lyophilized powder in intact vials should be stored at controlled room temperature.<sup>2918 2919 2920 2921</sup>

Single-dose vials of the solution should be used immediately after reconstitution.<sup>2918 2921</sup> Any remaining unused portion

should be discarded after 24 hours at room temperature or 48 hours under refrigeration at 2 to 8°C.<sup>2918 2921</sup> Vials should NOT be frozen after reconstitution.<sup>2918 2919 2921</sup>

The entire contents of the reconstituted pharmacy bulk package also should be used immediately after reconstitution.<sup>2918 2920</sup> Manufacturers' recommendations differ on the duration that the bulk pharmacy package may be stored at room temperature following reconstitution;<sup>2918 2920</sup> the specific product labeling should be consulted in such situations. Pharmacy bulk vials should NOT be frozen after reconstitution.<sup>2918 2920</sup>

After dilution in compatible infusion solutions, the drug is stable for up to 24 hours at room temperature or 1 week under refrigeration.<sup>2918 2920 2921</sup> Glass and plastic (including syringes, intravenous solution bags, and tubing) do not affect stability.<sup>2918 2919 2920 2921</sup>

Solutions prepared using the ADD-Vantage vials are stable for up to 24 hours at room temperature.<sup>2919</sup> These solutions should not be refrigerated nor frozen following reconstitution.<sup>2919</sup>

### Concentration Effects

In one study, piperacillin plus tazobactam dissolved in sterile water for injection to concentrations greater than 128 plus 16 g/L, respectively, resulted in unacceptably viscous solutions that impeded flow from elastomeric pumps to less than 75% of the nominal flow rate.<sup>3105</sup>

### Freezing Solutions

The commercially available, premixed frozen injection in single-dose Galaxy containers should be stored at or below –20°C.<sup>2918</sup> Thaw at room temperature or under refrigeration but not in a warm water bath or by microwave radiation.<sup>2918</sup> Thawed solutions should not be refrozen.<sup>2918</sup> After thawing, the solutions are stable for 24 hours at room temperature or 14 days refrigerated.<sup>2918</sup>

Piperacillin 80 mg/mL plus tazobactam 10 mg/mL in polyvinyl chloride (PVC) bags of dextrose 5% and sodium chloride 0.9% was frozen at –15°C for 30 days and thawed by microwave radiation for 45 seconds with no loss of either component.<sup>1768</sup>

Piperacillin 150 mg/mL plus tazobactam 18.75 mg/mL and piperacillin 200 mg/mL plus tazobactam 25 mg/mL in dextrose 5% and sodium chloride 0.9% were drawn as 20-mL aliquots into polypropylene syringes (Becton Dickinson). The syringes were frozen at –15°C for 30 days and then stored at 4°C for 7 days with no loss of either component.<sup>1768</sup>

Piperacillin 40 mg/mL plus tazobactam 5 mg/mL in dextrose 5% lost less than 3% after 3 months stored at –20°C. After microwave thawing, refrigerated storage resulted in 10% loss in 35 days.<sup>2614</sup>

### Syringes

Piperacillin 150 mg/mL plus tazobactam 18.75 mg/mL and piperacillin 200 mg/mL plus tazobactam 25 mg/mL in dextrose 5% and sodium chloride 0.9% were drawn as 20-mL aliquots into polypropylene syringes (Becton Dickinson). The syringes were stored at 25°C for 1 day and at 4°C for 7 days with no loss of either drug in the dextrose 5% samples. Similarly, no tazobactam loss occurred in the sodium chloride 0.9% solutions. However, piperacillin losses of 7% in 1 day at 25°C and 4% in 7 days at 4°C were found in the sodium chloride 0.9% solutions.<sup>1768</sup>

### Ambulatory Pumps

Infusion solutions prepared from single-dose vials and the bulk product have been shown to be stable for up to 12 hours at room temperature in an ambulatory infusion pump.<sup>2918 2920 2921</sup> Each dose was diluted to 25 or 37.5 mL, and stability was not affected.<sup>2918 2920 2921</sup>

### Central Venous Catheter

Piperacillin 10 mg/mL plus tazobactam 1.25 mg/mL (Lederle) in dextrose 5% was found to be compatible with the ARROW-g+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

<sup>a</sup> Tested in dextrose 5%.

<sup>b</sup> Tested in sodium chloride 0.9%.

<sup>c</sup> Refer to Appendix for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>d</sup> Tested in sterile water for injection.

<sup>e</sup> Tested in Ringer's injection, lactated.

<sup>f</sup> Injected via Y-site into an administration set running azithromycin.

<sup>g</sup> Test performed using the formulation WITHOUT edetate disodium.

<sup>h</sup> Test performed using the formulation WITH edetate disodium.

<sup>i</sup> Piperacillin component. Piperacillin in an 8:1 fixed-ratio concentration with tazobactam.

<sup>j</sup> Trimethoprim component. Trimethoprim in a 1:5 fixed-ratio concentration with sulfamethoxazole.

<sup>k</sup> Tested as the premixed infusion solution.

<sup>l</sup> If sterile water for injection is used as the diluent, manufacturers recommend a maximum volume per dose of 50 mL.

<sup>m</sup> Presence or absence of edetate disodium not specified.

<sup>n</sup> Quinupristin and dalfopristin components combined.

<sup>o</sup> Salt not specified.

<sup>p</sup> Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>q</sup> Ceftolozane component. Ceftolozane in a 2:1 fixed-ratio concentration with tazobactam.

<sup>r</sup> Meropenem component. Meropenem in a 1:1 fixed-ratio concentration with vaborbactam.

<sup>s</sup> Not specified whether concentration refers to single component or combined components.

**Additional Compatibility Information****Infusion Solutions**

Piperacillin–tazobactam (Zosyn, Wyeth) containing EDTA is compatible with Ringer's injection, lactated solution only for

Y-site administration.<sup>2918</sup> Formulations of the drug that do *not* contain EDTA are incompatible with Ringer's injection, lactated solution.<sup>2919 2920 2921</sup>

### *Peritoneal Dialysis Solutions*

The physical and chemical stability of piperacillin plus tazobactam (without EDTA) at concentrations of 200 plus 25 mcg/mL, respectively, were evaluated in Dianeal PD-2 with dextrose 1.5% and Dianeal PD-2 with dextrose 4.25%. Samples were stored at 4°C

for 14 days, 23°C for 7 days, and 37°C for 1 day. The samples were physically and chemically stable. Little or no loss of either component occurred in the 4°C samples throughout the 14-day period. At 23°C, losses of each component were in the range of 3 to 6% in 7 days. The 1-day losses at 37°C were similarly small.<sup>2018</sup>

## Plazomicin Sulfate

AHFS 8:12.02

### Products

Plazomicin sulfate is available in a concentration equivalent to plazomicin base 50 mg/mL in 10-mL single-dose (preservative-free) vials.<sup>3431</sup> Each vial also contains sodium hydroxide for pH adjustment and water for injection.<sup>3431</sup> The appropriate dose of plazomicin solution should be diluted in sodium chloride 0.9% or Ringer's injection, lactated to achieve a final volume of 50 mL.<sup>3431</sup>

### pH

Adjusted to 6.5.<sup>3431</sup>

### Trade Name(s)

Zemdri

### Administration

Plazomicin sulfate is administered by intravenous infusion over 30 minutes after dilution in sodium chloride 0.9% or Ringer's injection, lactated.<sup>3431</sup>

### Stability

Intact vials of plazomicin sulfate should be stored under refrigeration at 2 to 8°C.<sup>3431</sup> Plazomicin sulfate injection is a clear, colorless to yellow solution.<sup>3431</sup> The manufacturer states that the solution may become yellow, but that this change does not indicate a decrease in potency.<sup>3431</sup>

The manufacturer states that a solution of plazomicin diluted for infusion in sodium chloride 0.9% or Ringer's injection, lactated to concentrations of 2.5 to 45 mg/mL is stable for up to 24 hours at room temperature.<sup>3431</sup>

<sup>j</sup> Presence or absence of edetate disodium not specified.

<sup>k</sup> Piperacillin component. Piperacillin in an 8:1 fixed-ratio concentration with tazobactam.

<sup>l</sup> As epinephrine base rather than the salt.

<sup>m</sup> Salt not specified.

<sup>n</sup> Test performed using the formulation WITHOUT edetate disodium.

## Polymyxin B Sulfate

AHFS 8:12.28.28

### Products

Polymyxin B sulfate is available as a powder in vials containing 500,000 units of polymyxin B.<sup>3162 3163</sup> For intramuscular injection, the 500,000-unit vial should be reconstituted with 2 mL of sterile water for injection, sodium chloride 0.9%, or procaine hydrochloride 1%.<sup>3162 3163</sup> For intravenous infusion, 500,000 units of polymyxin B should be reconstituted by dissolving the drug in 300 to 500 mL of dextrose 5%.<sup>3162 3163</sup> For intrathecal administration, the 500,000-unit vial should be reconstituted with 10 mL of sodium chloride 0.9%.<sup>3162 3163</sup>

### Units

Each milligram of pure polymyxin base is equivalent to 10,000 units.<sup>3162 3163</sup> Each microgram of pure polymyxin base is equivalent to 10 units.<sup>3162 3163</sup>

### Administration

Polymyxin B sulfate is administered intravenously by continuous infusion, intrathecally, or intramuscularly.<sup>3162 3163</sup> Although poly-

myxin B sulfate may be administered by intramuscular injection, this route is not recommended due to severe injection site pain, particularly in infants and children.<sup>3162 3163</sup>

### Stability

Intact vials should be stored at controlled room temperature and retained in the carton until time of use to protect from light.<sup>3162 3163</sup> Aqueous solutions of polymyxin B sulfate may be stored under refrigeration for up to 12 months without a significant loss of potency; however, it is recommended that unused, refrigerated portions of the reconstituted solution be discarded after 72 hours.<sup>3162 3163</sup>

### pH Effects

The pH of maximum stability of polymyxin B is 3.4.<sup>2422</sup> In the pH range of 2 to 7, pH has little effect on the rate of decomposition; however, as pH values become more alkaline, solutions are less stable and the rate of decomposition increases markedly.<sup>1946 2422 3162 3163</sup>

## Posaconazole

AHFS 8:14.08

### Products

Posaconazole is available as an 18-mg/mL concentrate for injection in single-use vials containing 300 mg of the drug.<sup>2911</sup> The concentrate must be diluted prior to administration.<sup>2911</sup> Also present in each vial are betadex sulfobutyl ether sodium 6.68 g, edetate disodium 3 mg, hydrochloric acid and sodium hydroxide to adjust the pH, and water for injection.<sup>2911</sup>

### pH

The pH is adjusted to 2.6.<sup>2911</sup>

### Trade Name(s)

Noxafil

### Administration

Single-use vials contain posaconazole concentrate for injection that is administered only by slow intravenous infusion after diluting 16.7 mL (300 mg) of the concentrate in an intravenous bag or bottle containing a sufficient volume of a compatible infusion solution to yield a solution containing 1 to 2 mg/mL.<sup>2911</sup> Prior to dilution, the vials should be allowed to come to room temperature.<sup>2911</sup> The diluted solution must only be administered using a 0.22- $\mu$ m polyethersulfone or polyvinylidene difluoride inline filter.<sup>2911</sup>

Posaconazole is administered by slow intravenous infusion over approximately 90 minutes through a central venous line (e.g., central venous catheter, peripherally inserted central catheter).<sup>2911</sup> In certain circumstances (i.e., in anticipation of central

venous line placement or while the central venous line is being replaced or is being used for another treatment), a *single* dose of posaconazole may be administered through a peripheral venous catheter over approximately 30 minutes.<sup>2911</sup> If multiple doses of the drug are needed, a central line should be used; repeated administration of posaconazole through a peripheral venous catheter has been associated with thrombophlebitis.<sup>2911</sup> Posaconazole should *not* be administered as a bolus intravenous injection.<sup>2911</sup>

### Stability

Posaconazole concentrate for injection is a clear, colorless to yellow solution.<sup>2911</sup> Intact vials of posaconazole should be stored under refrigeration at 2 to 8°C.<sup>2911</sup> The injection contains no preservatives and is for single use.<sup>2911</sup> Any unused portions should be discarded.<sup>2911</sup>

After dilution, the resulting posaconazole solution also ranges from colorless to yellow; variations in color within this range do not affect product quality.<sup>2911</sup> Diluted solutions should be visually inspected for particulate matter prior to administration.<sup>2911</sup> Diluted solutions of posaconazole for infusion should be used immediately; admixtures not used immediately may be stored under refrigeration for up to 24 hours.<sup>2911</sup>

### Filtration

The concentrate for injection diluted for infusion must be administered through a 0.22- $\mu$ m polyethersulfone or polyvinylidene difluoride inline filter.<sup>2911</sup>

## Potassium Acetate

AHFS 40:12

### Products

Potassium acetate additive solution is available in 20-, 50-, and 100-mL single-dose vials at a concentration of 2 mEq/mL in water for injection. Each mL provides potassium acetate 196 mg. It is also available in 50-mL vials at a concentration of 4 mEq/mL in water for injection. Each mL provides 392 mg of potassium acetate. The pH of the solutions may have been adjusted with acetic acid when necessary. These concentrated solutions must be diluted for administration.<sup>1(9/06)</sup>

### pH

The pH of potassium acetate additive solution has been stated to be approximately 7.1 to 7.7<sup>4</sup> with a range of 5.5 to 8.<sup>1(9/06)</sup>

### Osmolarity

The osmolarity of the 2-mEq/mL solution is 4000 mOsm/L and the 4-mEq/mL solution is 8000 mOsm/L.<sup>1(9/06)</sup>

### Administration

Potassium acetate is administered as a dilute solution by slow intravenous infusion. It must not be administered undiluted.<sup>1(9/06)</sup><sup>4</sup> In most cases, the maximum recommended concentration is 40 mEq/L. Solutions generally may be infused at a rate up to 20 mEq/hr.<sup>4</sup>

### Stability

Potassium acetate additive solution should be stored at room temperature and protected from freezing. It should not be administered unless the solution is clear.<sup>1(9/06)</sup>

## Potassium Chloride

### AHFS 40:12

#### Products

Potassium chloride is available as concentrated solutions of 1.5 and 2 mEq/mL in 10-, 20-, 30-, and 40-mEq sizes in water for injection in ampuls, vials, and syringes. It is also available in a 30-mL (60-mEq) multiple-dose vial containing methylparaben 0.05% and propylparaben 0.005% as preservatives and 250-mL pharmacy bulk packages. The pH may have been adjusted with hydrochloric acid and if necessary potassium hydroxide during manufacture. The concentrated solutions must be diluted for use.<sup>1(5/06)</sup>

Potassium chloride is also available premixed in infusion solutions in concentrations of 10, 20, 30, and 40 mEq/L.<sup>4</sup>

#### pH

The pH is usually near 4.6 with a range from 4 to 8.<sup>1(5/06)</sup> 17

#### Osmolarity

The injections are very hypertonic; the 2-mEq/mL concentration has an osmolality of 4000 mOsm/L. The injection must be diluted for use.<sup>1(5/06)</sup>

#### Osmolality

The osmolality of potassium chloride (Abbott) 2 mEq/mL was determined to be 4355 mOsm/kg by freezing-point depression and 3440 mOsm/kg by vapor pressure.<sup>1071</sup>

The osmolality of a potassium chloride 7.5% solution was determined to be 1895 mOsm/kg.<sup>1233</sup>

#### Administration

Potassium chloride in the concentrated injections must be diluted before slow intravenous administration. Mix potassium

chloride injection thoroughly with the infusion solution before administration. The usual maximum concentration is 40 mEq/L. Extravasation should be avoided.<sup>1(5/06)</sup> 4

Great care is required when adding potassium chloride to infusion solutions, whether in flexible plastic containers or in rigid bottles. Adding potassium chloride to running infusion solutions hanging in the use position, especially in flexible containers, has resulted in the pooling of potassium chloride and a resultant high-concentration bolus of the drug being administered to patients, with serious and even fatal consequences. Attempts to mix adequately the potassium chloride in flexible containers by squeezing the container in the hanging position were unsuccessful. It is recommended that drugs be admixed with solutions in flexible containers when positioned with the injection arm of the container uppermost. With both rigid bottles and flexible containers, subsequent repeated inversion and agitation to effect thorough mixture are necessary.<sup>85 130</sup>

454 455 456 714 715 1127 1778 2151

#### Stability

The solution should be stored at controlled room temperature and used only if it is clear.<sup>1(5/06)</sup>

Potassium chloride injection 80 mEq/L added to dextrose 5% contained in glass bottles results in a leaching of precipitates consisting of silica and alumina.<sup>129</sup>

<sup>i</sup> Tested in Ringer's injection, lactated.

<sup>j</sup> Tested in dextrose 5% in Ringer's injection.

<sup>k</sup> Tested in dextrose 5% in Ringer's injection, lactated, dextrose 5%, Ringer's injection, lactated, and sodium chloride 0.9%.

<sup>l</sup> Lyophilized formulation tested.

<sup>m</sup> Refer to Appendix for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>n</sup> Tested in dextrose 5% in sodium chloride 0.45%.

<sup>o</sup> Tested in dextrose 5% in sodium chloride 0.225%.

<sup>p</sup> Tested with albumin human 0.1%.

<sup>q</sup> Test performed using the formulation WITHOUT edetate disodium.

<sup>r</sup> Piperacillin component. Piperacillin in an 8:1 fixed-ratio concentration with tazobactam.

<sup>s</sup> Quinupristin and dalbapristin components combined.

<sup>t</sup> Ceftolozane component. Ceftolozane in a 2:1 fixed-ratio concentration with tazobactam.

<sup>u</sup> Meropenem component. Meropenem in a 1:1 fixed-ratio concentration with vaborbactam.

<sup>v</sup> Ceftazidime component. Ceftazidime in a 4:1 fixed-ratio concentration with avibactam.

<sup>w</sup> Test performed using the formulation WITH edetate disodium.

**Additional Compatibility Information****Methylprednisolone**

The compatibility of methylprednisolone sodium succinate (Upjohn) with potassium chloride added to an auxiliary medication infusion unit has been studied. Primary admixtures were prepared by adding potassium chloride 40 mEq/L to dextrose 5%, dextrose 5% in sodium chloride 0.9%, and Ringer's injection, lactated. The primary admixture was added along with methylprednisolone sodium succinate (Upjohn) to the auxiliary medication infusion unit with the following results:<sup>329</sup>

Methylprednisolone Sodium Succinate	Potassium Chloride 40 mEq/L Primary Solution	Results
500 mg	D5S, D5W, LR qs 100 mL	Clear solution for 24 hr
1000 mg	D5W qs 100 mL	Clear solution for 24 hr
1000 mg	D5S, LR qs 100 mL	Clear solution for 6 hr
2000 mg	D5S, D5W, LR qs 100 mL	Clear solution for 24 hr

## Potassium Phosphates

### AHFS 40:12

#### Products

Potassium phosphates is available as a concentrate for injection in 5- or 15-mL single-dose vials and in a 50-mL pharmacy bulk package.<sup>3594 3595 3596</sup> The concentrate for injection must be diluted for use.<sup>3594 3595 3596</sup>

Each mL of the Fresenius Kabi and Hospira products contains monobasic potassium phosphate 224 mg and dibasic potassium phosphate 236 mg in water for injection.<sup>3594 3596</sup> The phosphate concentration of the concentrate for injection is 3 mmol/mL, and the potassium concentration is 4.4 mEq/mL.<sup>3594 3596</sup>

Each mL of the CMP Pharma product contains monobasic potassium phosphate 175 mg and dibasic potassium phosphate 300 mg in water for injection.<sup>3595</sup> The phosphate concentration of the concentrate for injection is 3 mmol/mL, and the potassium concentration is 4.7 mEq/mL.<sup>3595</sup>

The relationship between milliequivalents and millimoles of phosphate is expressed in the following equation:

$$(\text{mEq phosphate} = \text{mmol phosphate} \times \text{valence})$$

However, the average valence of phosphate changes with changes in pH. Consequently, it is necessary to specify a pH before the valence, and therefore the milliequivalents, can be determined. To avoid this problem, it has been suggested that doses of phosphate be expressed in terms of millimoles, which is independent of valence.<sup>178 716 717 718</sup> Alternatively, the dose may be expressed in terms of milligrams of phosphorus: 1 millimole of phosphorus equals 31 mg.<sup>205 717 3594 3595 3596</sup>

#### pH

Potassium phosphates injection (Fresenius Kabi) is stated to have a pH of 6 to 7.<sup>3594</sup>

Potassium phosphates injection (CMP Pharma) is stated to have a pH of 6.5 to 7.5.<sup>3595</sup>

#### Osmolarity

The calculated osmolarity of potassium phosphates injection (Fresenius Kabi, Hospira) is 7.4 mOsm/mL.<sup>3594 3596</sup>

The calculated osmolarity of potassium phosphates injection (CMP Pharma) is 7.7 mOsm/mL.<sup>3595</sup>

#### Aluminum Content

Potassium phosphates injection (Fresenius Kabi) contains no more than 2000 mcg of aluminum per L.<sup>3594</sup>

Potassium phosphates injection (CMP Pharma) contains no more than 15,000 mcg of aluminum per L.<sup>3595</sup>

Potassium phosphates injection (Hospira) contains no more than 31,000 mcg of aluminum per L.<sup>3596</sup>

#### Administration

Potassium phosphates injection is administered by intravenous infusion *only* after dilution or admixing in a larger volume of fluid;

the concentrate for injection is *not* for direct infusion.<sup>3594 3595</sup>  
<sup>3596</sup> Administration of undiluted or insufficiently diluted potassium phosphates injection and administration by rapid infusion (e.g., over 1 to 3 hours) or by bolus or rapid intravenous push has resulted in serious and sometimes fatal adverse effects.<sup>3594 3595</sup>

When the drug is used diluted in intravenous fluids for the correction of hypophosphatemia in *adults and pediatric patients 12 years of age or older*, the appropriate dose of potassium phosphates should be diluted to a total volume of 100 to 250 mL in sodium chloride 0.9% or dextrose 5%.<sup>3594 3595</sup> For *peripheral venous administration*, Fresenius Kabi states that the maximum recommended concentration is 6.8 mmol of phosphate/100 mL and the maximum recommended rate of administration is 6.8 mmol of phosphate/hr.<sup>3594</sup> For *peripheral venous administration*, CMP Pharma states that the maximum recommended concentration is 6.4 mmol of phosphate/100 mL and the maximum recommended rate of administration is 6.4 mmol of phosphate/hr.<sup>3595</sup> For *central venous administration*, manufacturers state that the maximum recommended concentration is 18 mmol of phosphate/100 mL and the maximum recommended rate of administration is 15 mmol of phosphate/hr.<sup>3594 3595</sup>

When the drug is used diluted in intravenous fluids for the correction of hypophosphatemia in *pediatric patients less than 12 years of age*, the appropriate dose of potassium phosphates should be diluted in the smallest recommended volume, taking into consideration the daily fluid requirements and the maximum concentrations recommended for peripheral and central venous administration.<sup>3594</sup> For *peripheral venous administration*, the manufacturer states that the maximum recommended concentration is 0.27 mmol of phosphate/10 mL.<sup>3594</sup> For *central venous administration*, the manufacturer states that the maximum recommended concentration is 0.55 mmol of phosphate/10 mL.<sup>3594</sup>

When the drug is used in parenteral nutrition admixtures, the appropriate dose of potassium phosphates injection should be added to the parenteral nutrition solution *after* the addition of amino acids, dextrose, and electrolyte solutions and *prior* to the addition of fat emulsion, if included.<sup>3594 3595</sup> Selection of the peripheral or central venous route depends upon the osmolarity of the final infusate.<sup>3594 3595</sup> Manufacturers state that solutions with an osmolarity of 900 mOsm/L or more must be infused through a central vein.<sup>3594 3595</sup>

The infusion set and catheter should be checked periodically during administration for precipitates.<sup>3594 3595</sup> Peripheral venous administration of the diluted and admixed drug can cause thrombophlebitis.<sup>3594 3595</sup> If thrombophlebitis develops, the catheter should be removed as soon as possible and appropriate treatment should be initiated.<sup>3594 3595</sup>

#### Stability

Potassium phosphates injection is a clear and colorless solution.<sup>3594</sup>  
<sup>3595 3596</sup> Intact vials of potassium phosphates injection (Fresenius

Kabi, Hospira) should be stored at controlled room temperature.<sup>3594 3596</sup> Intact vials of potassium phosphates injection (CMP Pharma) should be stored at 2 to 8°C and should not be frozen.<sup>3595</sup>

Solutions should be visually inspected for particulate matter and discoloration prior to and after dilution, and again prior to administration of the diluted solution for infusion or admixture.<sup>3594 3595 3596</sup>

Fresenius Kabi states that diluted solutions of potassium phosphates for infusion in dextrose 5% and sodium chloride 0.9% are stable for 4 hours at 20 to 25°C and 14 days at 2 to 8°C.<sup>3594</sup> CMP Pharma states that diluted solutions of potassium phosphates for infusion in dextrose 5% and sodium chloride 0.9% are stable for 48 hours at 20 to 25°C and 2 to 8°C.<sup>3595</sup>

Manufacturers state that parenteral nutrition admixtures to which potassium phosphates injection has been added

should be inspected both after mixing and prior to administration to ensure that precipitates have not formed and that the emulsion has not separated, in the case that fat emulsion has been added.<sup>3594 3595</sup> Parenteral nutrition admixtures to which potassium phosphates injection has been added should be used promptly after mixing.<sup>3594 3595</sup> Any storage of the admixtures should be limited to no longer than 24 hours at 2 to 8°C protected from light.<sup>3594 3595</sup> After removal from refrigeration, admixtures should be allowed to come to room temperature and should be used promptly, with completion of the infusion within 24 hours.<sup>3594 3595</sup> Any admixture remaining after that time should be discarded.<sup>3594 3595</sup>

Unused portions of single-dose vials should be discarded.<sup>3594</sup>  
<sup>3595 3596</sup> The pharmacy bulk package should be discarded within 4 hours of initial entry.<sup>3594</sup>

<sup>a</sup> Tested in dextrose 5%.

<sup>b</sup> Tested in sodium chloride 0.9%.

<sup>c</sup> Refer to Appendix for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>d</sup> Tested in dextrose 5% in sodium chloride 0.225%.

<sup>e</sup> Tested in Ringer's injection, lactated.

<sup>f</sup> Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>g</sup> Ceftolozane component. Ceftolozane in a 2:1 fixed-ratio concentration with tazobactam.

<sup>h</sup> Meropenem component. Meropenem in a 1:1 fixed-ratio concentration with vaborbactam.

<sup>i</sup> Ceftazidime component. Ceftazidime in a 4:1 fixed-ratio concentration with avibactam.

## Additional Compatibility Information

### Infusion Solutions

Potassium phosphates injection diluted for infusion should not be infused with calcium-containing intravenous fluids.<sup>3594 3595</sup>

### Calcium and Phosphate

#### UNRECOGNIZED CALCIUM PHOSPHATE PRECIPITATION IN A 3-IN-1 PARENTERAL NUTRITION MIXTURE RESULTED IN PATIENT DEATH.

The potential for the formation of a calcium phosphate precipitate in parenteral nutrition solutions is well studied and documented,<sup>1771 1777</sup> but the information is complex and difficult to apply to the clinical situation.<sup>1770 1772 1777</sup> The incorporation of fat emulsion in 3-in-1 parenteral nutrition solutions obscures any precipitate that is present which has led to substantial debate on the dangers associated with 3-in-1 parenteral nutrition mixtures and when or if the danger to the patient is warranted therapeutically.<sup>1770 1771 1772 2031 2032 2033 2034 2035 2036</sup> Because such precipitation may be life-threatening to patients,<sup>2037 2291</sup> FDA issued a Safety Alert containing the following recommendations:<sup>1769</sup>

1. "The amounts of phosphorus and of calcium added to the admixture are critical. The solubility of the added calcium should be calculated from the volume at the time the calcium is added. It should not be based upon the final volume.

Some amino acid injections for TPN admixtures contain phosphate ions (as a phosphoric acid buffer). These phosphate ions and the volume at the time the phosphate is added should be considered when calculating the concentration of phosphate additives. Also, when adding calcium and phosphate to an admixture, the phosphate should be added first.

The line should be flushed between the addition of any potentially incompatible components.

2. A lipid emulsion in a 3-in-1 admixture obscures the presence of a precipitate. Therefore, if a lipid emulsion is needed, either (1) use a 2-in-1 admixture with the lipid infused separately, or (2) if a 3-in-1 admixture is medically necessary, then add the calcium before the lipid emulsion and according to the recommendations in number 1 above.

If the amount of calcium or phosphate which must be added is likely to cause a precipitate, some or all of the calcium should be administered separately. Such separate infusions must be properly diluted and slowly infused to avoid serious adverse events related to the calcium.

3. When using an automated compounding device, the above steps should be considered when programming the device. In addition, automated compounders should be maintained and operated according to the manufacturer's recommendations.

Any printout should be checked against the programmed admixture and weight of components.

4. During the mixing process, pharmacists who mix parenteral nutrition admixtures should periodically agitate the admixture and check for precipitates. Medical or home care personnel who start and monitor these infusions should carefully inspect for the presence of precipitates both before and during infusion. Patients and care givers should be trained to visually inspect for signs of precipitation. They also should be advised to stop the infusion and seek medical assistance if precipitates are noted.

5. A filter should be used when infusing either central or peripheral parenteral nutrition admixtures. At this time, data have not been submitted to document which size filter is most effective in trapping precipitates.

Standards of practice vary, but the following is suggested: a 1.2- $\mu\text{m}$  air-eliminating filter for lipid-containing admixtures and a 0.22- $\mu\text{m}$  air-eliminating filter for non-lipid-containing admixtures.

- Parenteral nutrition admixtures should be administered within the following time frames: if stored at room temperature, the infusion should be started within 24 hours after mixing; if stored at refrigerated temperatures, the infusion should be started within 24 hours of rewarming. Because warming parenteral nutrition admixtures may contribute to the formation of precipitates, once administration begins, care should be taken to avoid excessive warming of the admixture.

Persons administering home care parenteral nutrition admixtures may need to deviate from these time frames. Pharmacists who initially prepare these admixtures should check a reserve sample for precipitates over the duration and under the conditions of storage.

- If symptoms of acute respiratory distress, pulmonary emboli, or interstitial pneumonitis develop, the infusion should be stopped immediately and thoroughly checked for precipitates. Appropriate medical interventions should be instituted. Home care personnel and patients should immediately seek medical assistance.<sup>11769</sup>

### Calcium Phosphate Precipitation Fatalities

Fatal cases of paroxysmal respiratory failure in 2 previously healthy women receiving peripheral vein parenteral nutrition were reported. The patients experienced sudden cardiopulmonary arrest consistent with pulmonary emboli. The authors used in vitro simulations and an animal model to conclude that unrecognized calcium phosphate precipitation in a 3-in-1 total nutrition admixture caused the fatalities. The precipitation resulted during compounding by introducing calcium and phosphate near to one another in the compounding sequence and prior to complete fluid addition. This resulted in a temporarily high concentration of the drugs and precipitation of calcium phosphate. Observation of the precipitate was obscured by the incorporation of 20% fat emulsion, intravenous, into the nutrition mixture. No filter was used during infusion of the fatal nutrition admixtures.<sup>2037</sup>

In a follow-up retrospective review, 5 patients were identified who had respiratory distress associated with the infusion of the 3-in-1 admixtures at around the same time. Four of these 5 patients died, although the cause of death could be definitively determined for only 2.<sup>2291</sup>

### Calcium and Phosphate Conditional Compatibility

Calcium salts are conditionally compatible with phosphate in parenteral nutrition solutions. The incompatibility is dependent on a solubility and concentration phenomenon and is not entirely predictable. Precipitation may occur during compounding or at some time after compounding is completed.

NOTE: Some amino acids solutions inherently contain calcium and phosphate, which must be considered in any projection of compatibility.

The compatibility of calcium and phosphate in several parenteral nutrition formulas for newborn infants was evaluated. Calcium gluconate 10% (Cutter) and potassium phosphate (Abbott) were used to achieve concentrations of 2.5 to 100 mEq/L of calcium and 2.5 to 100 mmol/L of phosphorus added. The parenteral nutrition solutions evaluated were as shown in Table 1. The results were reported as graphic depictions.

**Table 1. Parenteral nutrition solutions evaluated<sup>609</sup>**

Component	Solution Number			
	#1	#2	#3	#4
FreAmine III	4%	2%	1%	1%
Dextrose	25%	20%	10%	10%
pH	6.3	6.4	6.6	7.0 <sup>a</sup>

<sup>a</sup> Adjusted with sodium hydroxide.

The pH dependence of the phosphate–calcium precipitation has been noted. Dibasic calcium phosphate is very insoluble, while monobasic calcium phosphate is relatively soluble. At low pH, the soluble monobasic form predominates; but as the pH increases, more dibasic phosphate becomes available to bind with calcium and precipitate. Therefore, the lower the pH of the parenteral nutrition solution, the more calcium and phosphate can be solubilized. Once again, the effects of temperature were observed. As the temperature is increased, more calcium ion becomes available and more dibasic calcium phosphate is formed. Therefore, temperature increases will increase the amount of precipitate.<sup>609</sup>

Similar calcium and phosphate solubility curves were reported for neonatal parenteral nutrition solutions using TrophAmine (McGaw) 2, 1.5, and 0.8% as the sources of amino acids. The solutions also contained dextrose 10%, with cysteine and pH adjustment being used in some admixtures. Calcium and phosphate solubility followed the patterns reported previously.<sup>609</sup> A slightly greater concentration of phosphate could be used in some mixtures, but this finding was not consistent.<sup>1024</sup>

Using a similar study design, 6 neonatal parenteral nutrition solutions based on Aminosyn-PF (Abbott) 2, 1.5, and 0.8%, with and without added cysteine hydrochloride and dextrose 10% were studied. Calcium concentrations ranged from 2.5 to 50 mEq/L, and phosphate concentrations ranged from 2.5 to 50 mmol/L. Solutions sat for 18 hours at 25°C and then were warmed to 37°C in a water bath to simulate the clinical situation of warming prior to infusion into a child. Solubility curves were markedly different than those for TrophAmine in the previous study.<sup>1024</sup> Solubilities were reported to decrease by 15 mEq/L for calcium and 15 mmol/L for phosphate. The solutions remained clear during room temperature storage, but crystals often formed on warming to 37°C.<sup>1211</sup>

However, these data were questioned. The similarities between the Aminosyn-PF and TrophAmine products were noted, and little difference was found in calcium and phosphate solubilities in a preliminary report.<sup>1212</sup> In the full report,<sup>1213</sup>

parenteral nutrition solutions containing Aminosyn-PF or TrophAmine 1 or 2.5% with dextrose 10 or 25%, respectively, plus electrolytes and trace metals, with or without cysteine hydrochloride, were evaluated under the same conditions. Calcium concentrations ranged from 2.5 to 50 mEq/L, and phosphate concentrations ranged from 5 to 50 mmol/L. In contrast to the previous results,<sup>1024</sup> the solubility curves were very similar for the Aminosyn-PF and TrophAmine parenteral nutrition solutions but very different from those of the previous Aminosyn-PF study.<sup>1211</sup> The authors again showed that the solubility of calcium and phosphate is greater in solutions containing higher concentrations of amino acids and dextrose.<sup>1213</sup>

Calcium and phosphate solubility curves for TrophAmine 1 and 2% with dextrose 10% and electrolytes, vitamins, heparin, and trace elements were reported. Calcium concentrations ranged from 10 to 60 mEq/L, and phosphorus concentrations ranged from 10 to 40 mmol/L. Calcium and phosphate solubilities were assessed by analysis of the calcium concentrations and followed patterns similar to those reported previously.<sup>608 609</sup> The higher percentage of amino acids (TrophAmine 2%) permitted a slightly greater solubility of calcium and phosphate, especially in the 10 to 50-mEq/L and 10 to 35-mmol/L ranges, respectively.<sup>1614</sup>

The maximal product of the amount of calcium (as gluconate) times phosphate (as potassium) that can be added to a parenteral nutrition solution, composed of amino acids 1% (Travenol) and dextrose 10%, for preterm infants was reported. Turbidity was observed on initial mixing when the solubility product was around 115 to 130 mmol<sup>2</sup> (mmol squared) or greater. After storage at 7°C for 20 hours, visible precipitates formed at solubility products of 130 mmol<sup>2</sup> (mmol squared) or greater. If the solution was administered through a barium-impregnated silicone rubber catheter, crystalline precipitates obstructed the catheters in 12 hours at a solubility product of 100 mmol<sup>2</sup> (mmol squared) and in 10 days at 79 mmol<sup>2</sup> (mmol squared), much lower than the in vitro results.<sup>1041</sup>

The solubility of calcium and phosphorus in neonatal parenteral nutrition solutions composed of amino acids (Abbott) 1.25 and 2.5% with dextrose 5 and 10%, respectively, was evaluated. Also present were multivitamins and trace elements. The solutions contained calcium (as gluconate) in amounts ranging from 25 to 200 mg/100 mL. The phosphorus (as potassium phosphate) concentrations evaluated ranged from 25 to 150 mg/100 mL. If calcium gluconate was added first, cloudiness occurred immediately. If potassium phosphate was added first, substantial quantities could be added with no precipitate formation in 48 hours at 4°C (Table 2). However, if stored at 22°C, the solutions were stable for only 24 hours, and all contained precipitates after 48 hours.<sup>1210</sup>

**Table 2. Maximum calcium and phosphorus concentrations physically compatible for 48 hours at 4°C<sup>1210</sup>**

Calcium (mg/100 mL)	Phosphorus (mg/100 mL)	
	Amino Acids 1.25% + Dextrose 5% <sup>a</sup>	Amino Acids 2.5% + Dextrose 10% <sup>a</sup>
200 <sup>b</sup>	50	75

50	100	125
25	150 <sup>b</sup>	150 <sup>b</sup>

<sup>a</sup> Plus multivitamins and trace elements.

<sup>b</sup> Maximum concentration tested.

The physical compatibility of calcium gluconate 10 to 40 mEq/L and potassium phosphates 10 to 40 mmol/L in 3 neonatal parenteral nutrition solutions (TPN #123 to #125 in Appendix), alone and with retrograde administration of aminophylline 7.5 mg diluted with 1.5 mL of sterile water for injection was reported. Contact of the alkaline aminophylline solution with the parenteral nutrition solutions resulted in the precipitation of calcium phosphate at much lower concentrations than were compatible in the parenteral nutrition solutions alone.<sup>1404</sup>

The maximum allowable concentrations of calcium and phosphate in a 3-in-1 parenteral nutrition mixture for children (TNA #192 in Appendix) reported. Added calcium was varied from 1.5 to 150 mmol/L, while added phosphate was varied from 21 to 300 mmol/L. The mixtures were stable for 48 hours at 22 and 37°C as long as the pH was not greater than 5.7, the calcium concentration was below 16 mmol/L, the phosphate concentration was below 52 mmol/L, and the product of the calcium and phosphate concentrations was below 250 mmol<sup>2</sup>/L<sup>2</sup> (mmol squared per liter squared).<sup>1773</sup>

Additional calcium and phosphate solubility curves were reported for specialty parenteral nutrition solutions based on NephAmine and also HepatAmine at concentrations of 0.8, 1.5, and 2% as the sources of amino acids. The solutions also contained dextrose 10%, with cysteine and pH adjustment to simulate addition of fat emulsion used in some admixtures. Calcium and phosphate solubility followed the hyperbolic patterns previously reported.<sup>609</sup> Temperature, time, and pH affected calcium and phosphate solubility, with pH having the greatest effect.<sup>2038</sup>

The maximum sodium phosphate concentrations were reported for given amounts of calcium gluconate that could be admixed in parenteral nutrition solutions containing TrophAmine in varying quantities (with cysteine hydrochloride 40 mg/g of amino acid) and dextrose 10%. The solutions also contained magnesium sulfate 4 mEq/L, potassium acetate 24 mEq/L, sodium chloride 32 mEq/L, pediatric multivitamins, and trace elements. The presence of cysteine hydrochloride reduces the solution pH and increases the amount of calcium and phosphate that can be incorporated before precipitation occurs. The results of this study cannot be safely extrapolated to TPN solutions with compositions other than the ones tested. The admixtures were compounded with the sodium phosphate added last after thorough mixing of all other components. The authors noted that this is not the preferred order of mixing (usually phosphate is added first and thoroughly mixed before adding calcium last); however, they believed this reversed order of mixing would

provide a margin of error in cases in which the proper order is not followed. After compounding, the solutions were stored for 24 hours at 40°C. The maximum calcium and phosphate amounts that could be mixed in the various solutions were reported tabularly and are shown in Table 3.<sup>2039</sup> However, these results are not entirely consistent with another study. See Table 4.

**Table 3. Maximum amount of phosphate (as sodium) (mmol/L) not resulting in precipitation.<sup>2039</sup> See CAUTION below.<sup>a</sup>**

Calcium (as Gluconate)	Amino Acid (as TrophAmine) with Cysteine HCl 40 mg/g of Amino Acid				
	0%	0.4%	1%	2%	3%
9.8 mEq/L	0	27	42	60	66
14.7 mEq/L	0	15	18	30	36
19.6 mEq/L	0	6	15	27	30
29.4 mEq/L	0	3	6	21	24

<sup>a</sup> CAUTION: The results cannot be safely extrapolated to other solutions. See text.

The temperature dependence of the calcium–phosphate precipitation has resulted in the occlusion of a subclavian catheter by a solution apparently free of precipitation. The parenteral nutrition solution consisted of FreAmine III 500 mL, dextrose 70% 500 mL, sodium chloride 50 mEq, sodium phosphate 40 mmol, potassium acetate 10 mEq, potassium phosphate 40 mmol, calcium gluconate 10 mEq, magnesium sulfate 10 mEq, and Shil's trace metals solution 1 mL. Although there was no evidence of precipitation in the bottle, tubing and pump cassette, and filter (all at approximately 26°C) during administration, the occluded catheter and Vicra Loop Lock (next to the patient's body at 37°C) had numerous crystals identified as calcium phosphate. In vitro, this parenteral nutrition solution had a precipitate in 12 hours at 37°C but was clear for 24 hours at 26°C.<sup>610</sup>

Similarly, a parenteral nutrition solution that was clear and free of particulates after 2 weeks under refrigeration developed a precipitate in 4 to 6 hours when stored at room temperature. When the solution was warmed in a 37°C water bath, precipitation occurred in 1 hour. Administration of the solution before the precipitate was noticed led to interstitial pneumonitis due to deposition of calcium phosphate crystals.<sup>1427</sup>

Calcium phosphate precipitation phenomena was evaluated in a series of parenteral nutrition admixtures composed of dextrose 22%, amino acids (FreAmine III) 2.7%, and fat emulsion (Abbott) 0, 1, and 3.2%. Incorporation of calcium gluconate 19 to 24 mEq/L and phosphate (as sodium) 22 to 28 mmol/L resulted in visible precipitation in the fat-free admixtures. New precipitate continued to form over 14 days, even after repeated filtrations of the solutions through 0.2- $\mu$ m filters. The presence of the amino acids increased calcium and phosphate solubility, compared with simple aqueous solutions. However, the incorporation of the fat emulsion did not result in a statistically significant increase in calcium and phosphate solubility. The

authors noted that the kinetics of calcium phosphate precipitate formation do not appear to be entirely predictable; both transient and permanent precipitation can occur either during the compounding process or at some time afterward. Because calcium phosphate precipitation can be very dangerous clinically, the use of inline filters was recommended. The authors suggested that the filters should have a porosity appropriate to the parenteral nutrition admixture—1.2  $\mu$ m for fat-containing and 0.2 or 0.45  $\mu$ m for fat-free nutrition mixtures.<sup>2061</sup>

Laser particle analysis was used to evaluate the formation of calcium phosphate precipitation in pediatric TPN solutions containing TrophAmine in concentrations ranging from 0.5 to 3% with dextrose 10% and also containing L-cysteine hydrochloride 1 g/L. The solutions also contained in each liter sodium chloride 20 mEq, sodium acetate 20 mEq, magnesium sulfate 3 mEq, trace elements 3 mL, and heparin sodium 500 units. The presence of L-cysteine hydrochloride reduces the solution pH and increases the amount of calcium and phosphate that can be incorporated before precipitation occurs. The results of this study cannot be safely extrapolated to TPN solutions with compositions other than the ones tested. The maximum amount of phosphate that was incorporated without the appearance of a measurable increase in particulates in 24 hours at 37°C for each of the amino acids concentrations is shown in Table 4.<sup>2196</sup> These results are not entirely consistent with previous results.<sup>2039</sup> See above. The use of more sensitive electronic particle measurement for the formation of subvisible particulates in this study may contribute to the differences in the results.

**Table 4. Maximum amount of phosphate (as potassium) (mmol/L) not resulting in precipitation.<sup>2196</sup> See CAUTION below.<sup>a</sup>**

49	0	9	9	9	12	12
53	0	9	9	9	9	9

<sup>a</sup> CAUTION: The results cannot be safely extrapolated to solutions with formulas other than the ones tested. See text.

Calcium and phosphate compatibility was evaluated in a series of adult formula parenteral nutrition admixtures composed of FreAmine III, in concentrations ranging from 1 to 5% (TPN #258 through #262). The solutions also contained dextrose ranging from 15% up to 25%. Also present were sodium chloride, potassium chloride, and magnesium sulfate in common amounts. Cysteine hydrochloride was added in an amount of 25 mg/g of amino acids from FreAmine III to reduce the pH by about 0.5 pH unit and thereby increase the amount of calcium and phosphates that can be added to the TPN admixtures as has been done with pediatric parenteral nutrition admixtures. Phosphates as the potassium salts and calcium as the gluconate salt were added in variable quantities to determine the maximum amounts of calcium and phosphates that could be added to the test admixtures. The samples were evaluated at 23 and 37°C over 48 hours by visual inspection in ambient light and using a Tyndall beam and electronic measurement of turbidity and microparticulates. The addition of the cysteine hydrochloride resulted in an increase of calcium and phosphates solubility of about 30% by lowering the solution pH 0.5 pH unit. The boundaries between the compatible and incompatible concentrations were presented graphically as hyperbolic curves.<sup>2469</sup>

The presence of magnesium in solutions may also influence the reaction between calcium and phosphate, including the nature and extent of precipitation.<sup>158 159</sup>

The interaction of calcium and phosphate in parenteral nutrition solutions is a complex phenomenon. Various factors

have been identified as playing a role in the solubility or precipitation of a given combination, including:<sup>608 609 1042 1063 1404 1427 2778</sup>

1. Concentration of calcium
2. Salt form of calcium
3. Concentration of phosphate
4. Concentration of amino acids
5. Amino acids composition
6. Concentration of dextrose
7. Temperature of solution
8. pH of solution
9. Presence of other additives
10. Order of mixing

Enhanced precipitate formation would be expected from such factors as high concentrations of calcium and phosphate, increases in solution pH, decreased amino acid concentrations, increases in temperature, addition of calcium prior to the phosphate, lengthy standing times or slow infusion rates, and use of calcium as the chloride salt.<sup>854</sup>

Even if precipitation does not occur in the container, it has been reported that crystallization of calcium phosphate may occur in a Silastic infusion pump chamber or tubing if the rate of administration is slow, as for premature infants. Water vapor may be transmitted outward and be replaced by air rapidly enough to produce supersaturation.<sup>202</sup> Several other cases of catheter occlusion have been reported.<sup>610 1427 1428 1429</sup>

## Pralidoxime Chloride

AHFS 92:12

### Products

Pralidoxime chloride is available as a dry powder in 1-g vials with sodium hydroxide to adjust pH during manufacturing. Reconstitute with 20 mL of sterile water for injection to yield 50 mg/mL. For intravenous infusion, a concentration of 10 to 20 mg/mL in sodium chloride 0.9% is recommended. For intramuscular injection when intravenous administration is not feasible, reconstitute each vial with 3.3 mL of sterile water for injection to yield 300 mg/mL.<sup>1(6/08)</sup>

Pralidoxime chloride is also available as 600 mg/2 mL in autoinjectors. Also present in the formulation are benzyl alcohol 20 mg/mL and glycine 11.26 mg/mL in water for injection.<sup>1(6/08)</sup>

### pH

Vials: From 3.5 to 4.5. Autoinjectors: From 2 to 3.<sup>1(6/08)</sup>

### Administration

Pralidoxime chloride in vials is given by intravenous infusion at a concentration of 10 to 20 mg/mL in sodium chloride 0.9%. If necessary, the 50-mg/mL reconstituted drug may be given by slow intravenous injection over not less than five minutes. For intramuscular injection when intravenous administration is not feasible, a 300-mg/mL concentration may be used. Pralidoxime chloride in the autoinjectors is intended for intramuscular administration only.<sup>1(6/08)</sup>

### Stability

Pralidoxime chloride vials should be stored at controlled room temperature. Autoinjectors should be stored at room temperature and protected from freezing.<sup>1(6/08)</sup>

## Procainamide Hydrochloride

AHFS 24:04.04.04

### Products

Procainamide hydrochloride is available in 10-mL multidose vials providing 100 mg/mL or 2-mL multidose vials providing 500 mg/mL.<sup>3400</sup> Each mL of solution in the 10-mL vial also contains methylparaben 1 mg and sodium metabisulfite 0.8 mg in water for injection.<sup>3400</sup> Each mL of solution in the 2-mL vial also contains methylparaben 1 mg and sodium metabisulfite 1.8 mg in water for injection.<sup>3400</sup> In both vial sizes, the solution also may contain hydrochloric acid and/or sodium hydroxide to adjust the pH.<sup>3400</sup>

Procainamide hydrochloride also is available in single-dose, prefilled 10-mL syringes providing 100 mg/mL.<sup>3401</sup> Prefilled syringes are intended only for use in the preparation of intravenous infusion solutions.<sup>3401</sup> Each mL of solution also contains benzyl alcohol 9 mg and sodium bisulfite 0.9 mg in water for injection.<sup>3401</sup> The solution also may contain hydrochloric acid and/or sodium hydroxide to adjust the pH.<sup>3401</sup>

### pH

Procainamide hydrochloride injection solution has a pH adjusted to 5 (ranges from 4 to 6).<sup>3400 3401</sup>

### Administration

Procainamide hydrochloride may be administered by intramuscular or direct intravenous injection or intravenous infusion.<sup>3400 3401</sup> Manufacturers recommend that procainamide hydrochloride injection solution be diluted to a final volume with dextrose 5% prior to intravenous use in order to facilitate control of the administration rate.<sup>3400 3401</sup>

If procainamide hydrochloride is administered as a direct injection into a vein or into the tubing of an established intravenous line, the drug should be administered slowly, and the rate of administration should not exceed 50 mg/min.<sup>3400 3401</sup> Alternatively, a loading infusion may be administered.<sup>3400 3401</sup> To prepare a 20-mg/mL initial loading infusion, 1 g of procainamide hydrochloride should be diluted to 50 mL with dextrose 5% for intravenous administration at a rate of 1 mL/min for 25 to 30 minutes.<sup>3400 3401</sup>

Maintenance infusions of 2 mg/mL or 4 mg/mL (for fluid-restricted patients) should be prepared by diluting 1 g of procainamide hydrochloride to 500 or 250 mL, respectively, with dextrose 5%.<sup>3400 3401</sup> Intravenous infusions with a final concentration of 2 mg/mL may be administered at a rate of 1 to 3 mL/min; infusions with a final concentration of 4 mg/mL may be administered at a rate of 0.5 to 1.5 mL/min.<sup>3400 3401</sup>

### Stability

Intact vials and prefilled syringes of procainamide hydrochloride should be stored at controlled room temperature.<sup>3400 3401</sup>

Intact containers are packaged using nitrogen.<sup>3400 3401</sup> Injection of air into the vial causes the solution to darken.<sup>40</sup> Sulfites (e.g., sodium metabisulfite) are included in the formulation primarily to prevent discoloration that occurs as a result of oxidation of *p*-aminobenzoic acid, a degradation product of procainamide hydrochloride.<sup>1916</sup> The injection solution is initially colorless, but may turn slightly yellow over time.<sup>3400 3401</sup> Solutions that appear darker than a light amber color or are otherwise discolored should not be used.<sup>3400 3401</sup>

Procainamide hydrochloride forms  $\alpha$ - and  $\beta$ -glucosylamine compounds with dextrose.<sup>1896</sup> The reaction proceeds rapidly, with about 10% procainamide loss in dextrose 5% occurring in about 5 hours and 30% loss in 24 hours at 25°C.<sup>1896</sup> Equilibrium is achieved with about 62% of the procainamide present as glucosylamines.<sup>1896</sup> The bioavailability, activity, and metabolic fate of these compounds is not known.<sup>546 1896</sup> The  $\alpha$ - and  $\beta$ -glucosylamine compounds that form are reversible,<sup>1422 1896</sup> although the extent of reversibility in plasma has been questioned.<sup>2051</sup> The rate and extent of complex formation are dependent on the dextrose concentration and the solution pH but are independent of the procainamide hydrochloride concentration.<sup>1422</sup> In dextrose concentrations ranging from 1 to 5%, the extent of procainamide complex formation ranged from 6% in 2 days in dextrose 1% up to 35<sup>1422</sup> to 60%<sup>1896</sup> in dextrose 5%. Lowering the pH from the normal 4.5 to 1.4 with 0.01 *N* hydrochloric acid completely prevented complex formation.<sup>1422</sup> Similarly, increasing the solution pH to 8 is reported to block complexation.<sup>1423</sup> Maximum complex formation occurred at pH 3 to 5<sup>1423</sup> or 4 to 5.2,<sup>1358</sup> the natural pH of procainamide hydrochloride admixtures in dextrose 5%. The clinical importance of this complexation, if any, is uncertain.

Procainamide hydrochloride (Sandoz) 100 mg/mL repackaged in clear glass vials exhibited less than 10% loss in 193 days stored at 23°C when exposed to light and 5°C when protected from light.<sup>3402</sup> All solutions of procainamide hydrochloride stored at 23°C exposed to light exhibited an increase or darkening of yellow color; however, the 100-mg/mL solution stored in glass vials exhibited a more intense color as compared with 3-mg/mL solutions diluted in sodium chloride 0.9% stored in polyvinyl chloride (PVC) bags.<sup>3402</sup> Solutions stored in either container at 5°C and protected from light did not exhibit such color changes.<sup>3402</sup>

### Sorption

Procainamide hydrochloride was shown not to exhibit sorption to PVC bags and tubing, polyethylene tubing, Silastic tubing, and polypropylene syringes.<sup>536 606</sup>

## Prochlorperazine Edisylate

AHFS 28:16.08.24

### Products

Prochlorperazine 5 mg/mL (as edisylate) is available in 2-mL vials and 10-mL multiple-dose vials. Each mL of solution also contains sodium biphosphate 5 mg, sodium tartrate 12 mg, sodium saccharin 0.9 mg, and benzyl alcohol 0.75% in water for injection.<sup>1(2/08)</sup>

### pH

From 4.2 to 6.2.<sup>1(2/08)</sup>

### Administration

Prochlorperazine edisylate may be given intramuscularly deep into the upper outer quadrant of the buttock. It also may be given by direct intravenous injection at a rate not exceeding 5 mg/min. It can be given undiluted or diluted in a compatible diluent. It should not be given as a bolus intravenous injection.<sup>1(2/08)</sup> <sup>4</sup> For intravenous infusion, dilution of 20 mg in a liter of compatible infusion solution is recommended.<sup>4</sup> Because the drug causes local irritation, subcutaneous injection is not recommended.<sup>1(2/08)</sup> <sup>4</sup>

### Stability

Intact containers should be stored at controlled room temperature and protected from temperatures of 40°C or more and from freezing. Solutions of prochlorperazine edisylate are light sensitive and, therefore, should be protected from light. A slightly

yellow solution has not had its concentration altered. However, a markedly discolored solution should be discarded.<sup>1(2/08)</sup> <sup>4</sup>

Dilution of prochlorperazine edisylate to a 1-mg/mL concentration with bacteriostatic sodium chloride 0.9% containing methyl- and propylparabens resulted in a distinctly cloudy solution. This cloudiness did not occur when sodium chloride 0.9% preserved with benzyl alcohol was used for the dilution.<sup>752</sup>

### Light Effects

Prochlorperazine edisylate (Wyeth) 20 mg/L in dextrose 5% exhibited about 20% loss in 2 hours at room temperature when exposed to light. More rapid and extensive decomposition occurred when sodium chloride 0.9% was used as the diluent.<sup>2412</sup>

### Filtration

Prochlorperazine edisylate (SKF) 5 mg/L in dextrose 5% and sodium chloride 0.9% did not display significant sorption to a 0.45- $\mu$ m cellulose membrane filter.<sup>567</sup>

### Central Venous Catheter

Prochlorperazine edisylate (SoloPak) 0.5 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

## Prochlorperazine Mesylate

AHFS 28:16.08.24

### Products

Prochlorperazine mesylate injection is available in 1- and 2-mL glass ampuls. Each mL of solution contains prochlorperazine mesylate 12.5 mg with sodium sulfite, sodium metabisulfite, sodium chloride, ethanolamine, and water for injection.<sup>38 115</sup>

### Trade Name(s)

Stemetil

### Administration

Prochlorperazine mesylate injection is given by deep intramuscular injection.<sup>38 115</sup>

### Stability

Intact ampuls should be stored at controlled room temperature and protected from light. Exposure to light results in discoloration. Discolored injection should be discarded.<sup>38 115</sup>

## Promethazine Hydrochloride

AHFS 28:24.92

### Products

Promethazine hydrochloride is available in vials, ampuls, and syringe cartridges in concentrations of 25 and 50 mg/mL. Each mL also contains disodium edetate 0.1 mg, calcium chloride 0.04 mg, sodium metabisulfite 0.25 mg, phenol 5 mg, and acetic acid-sodium acetate buffer in water for injection.<sup>1(12/06)</sup>

### pH

From 4 to 5.5.<sup>1(12/06)</sup>

### Osmolality

The osmolality of promethazine hydrochloride 25 mg/mL was determined to be 291 mOsm/kg.<sup>1233</sup>

### Administration

Promethazine hydrochloride is administered preferably by deep intramuscular injection. It should not be given subcutaneously or intra-arterially. If given by intravenous injection, a concentration not exceeding 25 mg/mL should be given into the tubing of a running infusion solution at a rate not exceeding 25 mg/min.<sup>1(12/06)</sup> 4 Extravasation should be avoided.<sup>4 2312</sup>

### Stability

Store at controlled room temperature and protect from freezing and light. Inspect prior to administration for particulate matter formation and discoloration; discard if particulate matter or discoloration is observed.<sup>1(12/06)</sup> 4 Promethazine hydrochloride exhibits increasing stability with decreasing pH.<sup>1072</sup>

### Syringes

Promethazine hydrochloride 25 mg/mL repackaged in 3-mL amber glass syringes (Hy-Pod) and stored at 25°C exhibited no changes in pH or appearance over 360 days. A possible reduction in concentration to 95% of initial was noted.<sup>535</sup>

## Compatibility Information

### Solution Compatibility

#### Promethazine HCl

Test Soln Name	Mfr	Mfr	Conc/L or %	Remarks	Ref	C/I
Dextrose 2.5% in half-strength Ringer's injection	AB	WY	100 mg	Physically compatible	3	C
Dextrose 5% in Ringer's injection	AB	WY	100 mg	Physically compatible	3	C
Dextrose 2.5% in Ringer's injection, lactated	AB	WY	100 mg	Physically compatible	3	C

Dextrose 5% in Ringer's injection, lactated	AB	WY	100 mg	Physically compatible	3	C
Dextrose 10% in Ringer's injection, lactated	AB	WY	100 mg	Physically compatible	3	C

### Sorption

Promethazine hydrochloride (May & Baker) 8 mg/L in sodium chloride 0.9% (Travenol) in polyvinyl chloride (PVC) bags exhibited only about 5% sorption to the plastic during 1 week of storage at room temperature (15 to 20°C). However, when the solution was buffered from its initial pH of 5 to 7.4, approximately 59% of the drug was lost in 1 week due to sorption.<sup>536</sup>

In another study, promethazine hydrochloride (May & Baker) 8 mg/L in sodium chloride 0.9% exhibited a cumulative 22% loss due to sorption during a 7-hour simulated infusion through an infusion set (Travenol) consisting of a cellulose propionate burette chamber and 170 cm of PVC tubing. Both the burette and the tubing contributed to the loss. The extent of sorption was found to be independent of concentration.<sup>606</sup>

The drug was also tested as a simulated infusion over at least 1 hour by a syringe pump system. A glass syringe on a syringe pump was fitted with 20 cm of polyethylene tubing or 50 cm of Silastic tubing. Only 5% of the drug was lost with the polyethylene tubing, but a cumulative loss of 72% occurred during the 1-hour infusion through the Silastic tubing.<sup>606</sup>

A 25-mL aliquot of promethazine hydrochloride (May & Baker) 8 mg/L in sodium chloride 0.9% was stored in all-plastic syringes composed of polypropylene barrels and polyethylene plungers for 24 hours at room temperature in the dark. No loss due to sorption occurred.<sup>606</sup>

### Central Venous Catheter

Promethazine hydrochloride (Schein) 2 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

<sup>g</sup> Tested in dextrose 5% in Ringer's injection.

<sup>h</sup> Tested in Ringer's injection, lactated.

<sup>i</sup> Lyophilized formulation tested.

<sup>j</sup> Piperacillin component. Piperacillin in an 8:1 fixed-ratio concentration with tazobactam.

**Additional Compatibility Information****Chlorpromazine and Meperidine**

Chlorpromazine hydrochloride, meperidine hydrochloride, and promethazine hydrochloride combined as an extemporaneous mixture for preoperative sedation, developed a brownish-yellow

color after 2 weeks of storage with protection from light. The discoloration was attributed to the metacresol preservative content of the meperidine hydrochloride product used. Use of meperidine hydrochloride which contains a different preservative resulted in a solution that remained clear and colorless for at least 3 months when protected from light.<sup>1148</sup>

## Propofol

AHFS 28:04.92

### Products

Propofol is available as a ready-to-use oil-in-water emulsion in 20-, 50-, and 100-mL vials.<sup>3499 3500 3501 3502 3503</sup> Each mL contains propofol 10 mg along with soybean oil 100 mg, glycerol 22.5 mg, egg lecithin or phospholipids 12 mg, and sodium hydroxide to adjust the pH.<sup>3499 3500 3501 3502 3503</sup> Propofol products are not identical.<sup>3499 3500 3501 3502 3503</sup> Diprivan products contain disodium edetate 0.05 mg/mL (0.005%) as an antimicrobial agent.<sup>3499</sup> Generic propofol formulations may contain benzyl alcohol 1.5 mg/mL,<sup>3500</sup> benzyl alcohol 1.5 mg/mL and sodium benzoate 0.7 mg/mL,<sup>3501</sup> sodium metabisulfite 0.25 mg/mL,<sup>3502</sup> or sodium benzoate 1 mg/mL<sup>3503</sup> as an antimicrobial agent. Additionally, Diprivan and some generic propofol formulations have differing pH values (see Products: pH), which also may contribute to differing compatibility results among the products.<sup>2336</sup>

Compatibility information for propofol with other drugs established using the Diprivan formulation should not be extrapolated to generic propofol products because of formulation differences.<sup>2336</sup>

### pH

Diprivan has a pH ranging from 7 to 8.5.<sup>3499</sup>

The metabisulfite-containing formulation of propofol has a pH ranging from 4.5 to 6.6.<sup>3502</sup> The benzyl alcohol-containing formulation has a pH ranging from 5.5 to 7.4.<sup>3500</sup> The benzyl alcohol- and sodium benzoate-containing formulation and the sodium benzoate-containing formulations both have a pH ranging from 6 to 8.5.<sup>3501 3503</sup>

### Tonicity

Propofol 10 mg/mL injectable emulsion is isotonic.<sup>3499 3500 3501 3502 3503</sup>

### Trade Name(s)

Diprivan

### Administration

Before use, propofol should be shaken well.<sup>3499 3500 3501 3502 3503</sup> Propofol is administered by intravenous injection or infusion; if necessary, propofol may be diluted with dextrose 5% to a concentration not less than 2 mg/mL.<sup>3499 3500 3501 3502 3503</sup>

Numerous outbreaks of serious postoperative infections have resulted from inadvertent contamination of propofol.<sup>1930 3499 3500 3501 3502 3503</sup> The contamination resulted from risky preparation practices and lapses in aseptic technique.<sup>1930</sup> The lipid base supports microbiological growth.<sup>1930 3499 3500 3501 3502 3503</sup> The disodium edetate, sodium metabisulfite, or benzyl alcohol and/or sodium benzoate in the formulations can retard the growth of microorganisms for up to 12 hours, but the products can still support growth and are not antimicrobially preserved.<sup>3499 3500 3501 3502 3503</sup> Strict aseptic procedures are required during handling.<sup>3499 3500 3501 3502 3503</sup>

### Stability

Propofol injection is a white, oil-in-water emulsion.<sup>3499 3500 3501 3502 3503</sup> Intact containers should be stored at 4 to 25°C<sup>3499 3500 3502 3503</sup> or 20 to 25°C.<sup>3501</sup> Vials should not be frozen.<sup>3499 3500 3501 3502 3503</sup> The emulsion should not be used if there is evidence of excessive creaming or aggregation, if large droplets are visible, or if other forms of phase separation indicating compromised stability are present.<sup>3499 3500 3501 3502 3503</sup>

Because propofol undergoes oxidative degradation when exposed to oxygen, intact containers are packaged under nitrogen to avoid oxygen exposure.<sup>3499 3500 3501 3502 3503</sup> Whether propofol is administered directly from the vial or drawn into a syringe, administration should begin immediately and should be completed within 12 hours after the vial is spiked.<sup>3499 3500 3501 3502 3503</sup> The tubing and any unused propofol should be discarded after 12 hours.<sup>3499 3500 3501 3502 3503</sup>

Propofol formulated with sodium metabisulfite antioxidant is subject to a differing decomposition reaction compared with the edetate-containing Diprivan formulation. Exposure to air results in the formation of a yellow discoloration in about 6 to 7 hours, which does not occur with Diprivan. The yellow discoloration is a result of the formation of oxidized propofol dimer quinone from sulfite radicals that form in the generic product and may be associated with increased adverse effects. This oxidation product does not form in Diprivan containing edetate.<sup>2344 2575 2576</sup> Stability information for propofol established using the Diprivan formulation should not be extrapolated to generic formulations.<sup>2336 2344</sup>

The physical stability of both Diprivan and propofol containing sodium metabisulfite was evaluated. The formulation differences, principally pH, resulted in a much higher zeta potential for Diprivan, making it a more rugged emulsion and less subject to damage from physical agitation and thermal insult. Physical agitation resulted in no increase in fat droplet size in Diprivan after 16 hours, but a substantial increase in fat droplets larger than 5 μm occurred in as little as 4 hours in the sodium metabisulfite-containing formulation.<sup>2445</sup>

One benzyl alcohol-containing formulation of propofol had the same pH as Diprivan (pH 7 to 8.5) and exhibited the same degree of ruggedness and resistance to emulsion disruption as Diprivan.<sup>2659</sup>

In another study, propofol (Diprivan) was again reported to be a more rugged emulsion than the generic formulation containing sodium metabisulfite. Diprivan had a very low quantity of fat globules exceeding 5 μm throughout its shelf life. The sodium metabisulfite-containing formulation formed much greater amounts of globules of 5 μm or larger within a few months after manufacture and well before the expiration date. This 5-μm or larger globule size is an important threshold because globules of this size may occlude capillaries and lead to embolic syndrome. The safety of using this sodium metabisulfite-containing formulation of propofol, especially as the product nears its expiration date, was questioned.<sup>2589</sup>

Propofol emulsion is a single-access product and can support the growth of microorganisms.<sup>1930 3499 3500 3501 3502 3503</sup> In one study, propofol strongly supported the growth of *Escherichia coli* and *Candida albicans*.<sup>2411</sup> Strict adherence to proper aseptic procedures, including disinfecting the vial stopper with isopropyl alcohol 70%, is required.<sup>3499 3500 3501 3502 3503</sup> Use of the drug within 6 hours has been recommended.<sup>2411</sup>

### Plastic and Glass Containers

Diluted in dextrose 5%, propofol has been shown to be more stable in glass than in plastic containers; manufacturers indicate that only 95% of the drug remains after only 2 hours of a running infusion in plastic (material unspecified).<sup>3499 3500 3501 3502 3503</sup>

### Syringes

Propofol (Diprivan) 10 mg/mL was repackaged into 60-mL polypropylene syringes (Monoject, Sherwood Medical) and stored at 23°C under fluorescent light and at 4°C protected from light. No visually apparent changes occurred to the emulsion under either storage condition. Propofol losses were 7% in 5 days and 12% in 7 days in the room-temperature samples. No propofol losses occurred in 13 days in the refrigerated samples.<sup>1984</sup>

Propofol (Diprivan) 1% was repackaged into 2- and 10-mL Plastipak (Becton Dickinson) and 2-mL Injekt (B. Braun) plastic syringes and was stored at 5°C. Propofol losses were about 7 to 8% in the Plastipak syringes and about 2% in the Injekt syringes after 28 days of refrigerated storage.<sup>2118</sup>

### Sorption

Propofol (Diprivan) injection was diluted to 2 mg/mL with dextrose 5% and stored in polyvinyl chloride (PVC) tubing (Kendall-McGaw). A propofol loss exceeding 31% occurred after static

storage for 2 hours. In simulated infusions using the same initial concentration, administration through 72-inch PVC administration sets at a rate of 1.75 mL/min resulted in an average propofol loss of 7.7% over the 2-hour period.<sup>2057</sup>

When tested undiluted at 10 mg/mL, propofol (Diprivan) sorption to administration tubing composed principally of PVC did not represent a substantial portion of the total amount of drug delivered. Any losses that did occur were within the error of the method and were not clinically relevant.<sup>2297</sup>

Propofol (Diprivan) was delivered at rates of 1 and 10 mL/hr through PVC tubing. Little loss occurred at the higher rate of delivery. However, at the slower rate, up to 6% propofol loss due to sorption occurred.<sup>2468</sup>

### Plasticizer Leaching

As happens with surfactant-containing drug formulations, propofol emulsion also has been shown to leach diethylhexyl phthalate (DEHP) plasticizer from PVC equipment such as administration sets. The use of non-PVC administration sets has been recommended.<sup>2424</sup>

### Filtration

When filtration is clinically appropriate, manufacturers recommend that propofol be administered with caution only through a filter with a pore size of 5 µm or greater, unless the filter has demonstrated no effects on flow and/or breakdown of the emulsion.<sup>3499 3500 3501 3502 3503</sup> Continuous monitoring for restricted flow and/or emulsion breakdown is necessary if a filter is used.<sup>3499 3500 3501 3502 3503</sup> Filters with a pore size less than 5 µm should not be used.<sup>3499 3500 3501 3502 3503</sup>

Propofol (Diprivan) 1% 10 mL filtered through a 5-µm filter needle (Burr Medical) underwent no loss.<sup>2057</sup>

## Propranolol Hydrochloride

AHFS 24:24

### Products

Propranolol hydrochloride is available in 1-mL ampuls containing 1 mg of the drug with citric acid to adjust the pH in water for injection.<sup>1(9/06)</sup>

### pH

From 2.8 to 4.<sup>1(9/06)</sup>

### Osmolality

The osmolality of propranolol hydrochloride 1 mg/mL was determined to be 12 mOsm/kg.<sup>1233</sup>

### Trade Name(s)

Inderal

### Administration

Propranolol hydrochloride is administered by intravenous injection at a rate not exceeding 1 mg/min for life-threatening arrhythmias or those occurring during anesthesia.<sup>1(9/06) 4</sup>

### Stability

Propranolol hydrochloride should be stored at controlled room temperature around 25°C and protected from light, freezing, or excessive heat.<sup>1(9/06) 4</sup> Solutions of the drug have maximum stability at pH 3 and decompose rapidly at alkaline pH. Decomposition in aqueous solutions is accompanied by a lowered pH and discoloration. Solutions fluoresce at pH 4 to 5.<sup>4</sup>

### Sorption

Propranolol hydrochloride was shown not to exhibit sorption to polyvinyl chloride (PVC) bags and tubing, polyolefin containers, polyethylene tubing, Silastic tubing, and polypropylene syringes.<sup>536 606 746</sup>

## Protamine Sulfate

AHFS 20:28.08

### Products

Protamine sulfate is available in 5- and 25-mL vials. Each mL contains protamine sulfate 10 mg with sodium chloride 0.9% and sodium phosphate and/or sulfuric acid to adjust the pH.<sup>1(1/08)</sup>

### pH

From 6 to 7.<sup>1(1/08)</sup>

### Osmolality

The osmolality of protamine sulfate 10 mg/mL was determined to be 290 mOsm/kg by freezing-point depression and 292 mOsm/kg by vapor pressure.<sup>1071</sup>

### Administration

Protamine sulfate 10 mg/mL is administered by slow intravenous injection undiluted. No more than 50 mg should be

administered in any 10-minute period. It has also been given by intravenous infusion after dilution in sodium chloride 0.9% or dextrose 5%.<sup>1(1/08) 4</sup>

### Stability

Protamine sulfate should be stored under refrigeration; freezing should be avoided.<sup>1(1/08)</sup> However, protamine sulfate has been stated to be stable for 10 days<sup>1433</sup> to 2 weeks<sup>853</sup> at room temperature.

Protamine sulfate is incompatible with some antibiotics including cephalosporins and penicillins.<sup>1(1/08)</sup>

### Filtration

Protamine sulfate (Fournier Freres) 0.2 mg/mL in dextrose 5% and sodium chloride 0.9% was filtered through a 0.22- $\mu$ m cellulose ester membrane filter (Ivex-HP, Millipore) over 6 hours. No significant drug loss due to binding to the filter was noted.<sup>1034</sup>

## Prothrombin Complex Concentrate (Human)

AHFS 20:28.16

### Products

Prothrombin complex concentrate (human) is available in a kit as a lyophilized powder in single-use (preservative-free) vials.<sup>3182</sup> Each kit contains a vial of prothrombin complex concentrate (human) with a nominal concentration of 500 or 1000 units packaged with 20 or 40 mL, respectively, of sterile water for injection, a Mix2Vial filter transfer set, and an alcohol swab.<sup>3182</sup> Each vial of prothrombin complex concentrate (human) contains coagulation factors II, VII, IX, and X, and antithrombotic proteins C and S.<sup>3182</sup> Vials also contain antithrombin III, heparin, albumin human, sodium chloride, sodium citrate, hydrochloric acid, and sodium hydroxide as excipients.<sup>3182</sup>

#### Prothrombin complex concentrate (human) (Kcentra, CSL Behring) ingredient composition per vial

Ingredient	Prothrombin complex concentrate (human) nominal 500-unit vial	Prothrombin complex concentrate (human) nominal 1000-unit vial
Total protein	120 to 280 mg	240 to 560 mg
Factor II	380 to 800 units	760 to 1600 units
Factor VII	200 to 500 units	400 to 1000 units
Factor IX	400 to 620 units	800 to 1240 units
Factor X	500 to 1020 units	1000 to 2040 units
Protein C	420 to 820 units	840 to 1640 units
Protein S	240 to 680 units	480 to 1360 units
Heparin	8 to 40 units	16 to 80 units
Antithrombin III	4 to 30 units	8 to 60 units
Albumin human	40 to 80 mg	80 to 160 mg
Sodium chloride	60 to 120 mg	120 to 240 mg
Sodium citrate	40 to 80 mg	80 to 160 mg
Hydrochloric acid	Small amounts	Small amounts
Sodium hydroxide	Small amounts	Small amounts

The actual amount of coagulation factor and antithrombotic protein units contained in each vial is printed on the vial carton.<sup>3182</sup> The actual amount of factor IX units contained in each vial also is printed on the vial label.<sup>3182</sup>

Vials of prothrombin complex concentrate (human) and provided diluent should be allowed to come to room temperature prior to reconstitution.<sup>3182</sup> The nominal 500- or 1000-unit vial should be reconstituted with 20 or 40 mL, respectively, of sterile water for injection.<sup>3182</sup> The Mix2Vial filter transfer set provided in each kit should be used for reconstitution; specific product labeling should be consulted for additional preparation details.<sup>3182</sup> Vials should be gently swirled until the contents have completely dissolved and should not be shaken.<sup>3182</sup> The reconstituted contents of multiple vials may be pooled for patients requiring doses exceeding those provided in a single vial; however, a separate, unused Mix2Vial filter transfer set should be used for the reconstitution of each vial.<sup>3182</sup> When reconstituted as directed, the final concentration of factor IX units in each vial will range from 20 to 31 units/mL.<sup>3182</sup>

### Trade Name(s)

Kcentra

### Administration

Prothrombin complex concentrate (human) is administered by intravenous infusion at a rate of 0.12 mL/kg/min (approximately 3 factor IX units/kg/min) up to a maximum rate of 8.4 mL/min (approximately 210 factor IX units/min).<sup>3182</sup> If the reconstituted solution has been stored under refrigeration or cooled, the solution should be warmed to 20 to 25°C prior to administration.<sup>3182</sup>

Prothrombin complex concentrate (human) should be infused through a separate line from other medications.<sup>3182</sup> Blood should not enter the syringe containing the drug due to the possibility of fibrin clot formation.<sup>3182</sup>

### Stability

Intact vials should be stored at 2 to 25°C and kept in the original carton to protect from light.<sup>3182</sup> Vials should not be frozen.<sup>3182</sup> Prothrombin complex concentrate (human) reconstituted as directed with sterile water for injection is a colorless, clear to slightly opalescent solution.<sup>3182</sup>

Reconstituted solutions should be visually inspected for particulate matter and discoloration prior to administration; solutions that are cloudy or those containing deposits should not be used.<sup>3182</sup> Reconstituted solutions may be stored at 2 to 25°C; however, solutions should be used promptly and must be used within 4 hours following reconstitution.<sup>3182</sup> Any unused portion should be discarded.<sup>3182</sup>

© Copyright, March 2017. American Society of Health-System Pharmacists, Inc.

## Pyridoxine Hydrochloride

AHFS 88:08

### Products

Pyridoxine hydrochloride 100 mg/mL is available in 1-, 10-, and 30-mL multiple-dose vials. Antimicrobial preservatives, such as benzyl alcohol 1.5% or chlorobutanol 0.5%, may also be present. Sodium hydroxide and/or hydrochloric acid may have been used to adjust pH.<sup>1(6/06) 4</sup>

### pH

From 2 to 3.8.<sup>1(6/06) 4</sup>

### Osmolality

The osmolality of pyridoxine hydrochloride 100 mg/mL was determined to be 870 mOsm/kg by freezing-point depression and 852 mOsm/kg by vapor pressure.<sup>1071</sup>

### Administration

Pyridoxine hydrochloride may be administered by intramuscular, subcutaneous, or intravenous injection.<sup>4</sup>

## Compatibility Information

### Drugs in Syringe Compatibility

#### Pyridoxine HCl

Test Drug	Mfr	Amt	Mfr	Amt	Remarks	Ref	C/I
Doxapram HCl	RB	400 mg/20 mL		10 mg/1 mL	Physically compatible with 6% doxapram loss in 24 hr	1177	C

## Additional Compatibility Information

### Parenteral Nutrition Solutions

The stability of pyridoxine hydrochloride 15 mg/L was studied in representative parenteral nutrition solutions exposed to fluorescent light, indirect sunlight, and direct sunlight for eight hours. One 5-mL vial of multivitamin concentrate (Lyphomed) containing 15 mg of pyridoxine hydrochloride and also 1 mg of folic acid (Lederle) was added to a liter of parenteral nutrition solution composed of amino acids 4.25%–dextrose 25% (Travenol) with standard electrolytes and trace elements. Pyridoxine hydrochloride was stable over the eight-hour study at room temperature under fluorescent light and indirect sunlight.

Selected Revisions October 1, 2012. © Copyright, October 1982. American Society of Health-System Pharmacists, Inc.

### Stability

The product should be stored at controlled room temperature and protected from freezing and from light.<sup>1(6/06) 4</sup>

Because pyridoxine hydrochloride is photosensitive and degrades slowly when exposed to light, protection from light has been recommended.<sup>4</sup>

### Syringes

Pyridoxine hydrochloride 100 mg/mL was stable for six months at room temperature packaged in 5-, 10-, and 20-mL polypropylene syringes (Becton Dickinson).<sup>2692</sup>

### Sorption

Pyridoxine hydrochloride (Sigma) 40 mg/L did not display significant sorption to a PVC plastic test strip in 24 hours.<sup>12</sup>

However, eight hours of exposure to direct sunlight caused an 86% loss of pyridoxine hydrochloride.<sup>842</sup>

The stability of numerous vitamins in parenteral nutrition solutions composed of amino acids (Kabi-Vitrum), dextrose 30%, and fat emulsion 20% (Kabi-Vitrum) in a 2:1:1 ratio with electrolytes, trace elements, and both fat- and water-soluble vitamins was reported. The admixtures were stored in darkness at 2 to 8°C for 96 hours with no significant loss of pyridoxine hydrochloride.<sup>1225</sup>

The vitamins in Cernevit (Baxter) diluted in three 2-in-1 parenteral nutrition admixtures were tested for stability over 48 hours. Most of the other vitamins, including pyridoxine hydrochloride, retained their initial concentrations.<sup>2796</sup>

## Quinidine Gluconate

AHFS 24:04.04.04

### Products

Quinidine gluconate is available in 10-mL vials. Each mL contains 80 mg of drug with edetate disodium 0.005% and phenol 0.25% in water for injection. D-gluconic acid delta-lactone may have been added to adjust the pH.<sup>1(9/06)</sup>

### Equivalency

Quinidine gluconate 800 mg is equivalent to 500 mg of anhydrous quinidine.<sup>1(9/06)</sup>

### pH

Quinidine gluconate injection has a pH of 5.5 to 7.<sup>4</sup>

### Administration

Quinidine gluconate injection may be given by intermittent or continuous intravenous administration.<sup>4</sup> For intravenous administration in treating arrhythmias, 800 mg (10 mL) is diluted with 40 mL of dextrose 5% for a total of 50 mL to yield a 16-mg/mL solution. The drug has also been given by intramuscular injection, but this route is not recommended because of variable absorption.<sup>1(9/06)</sup><sup>4</sup>

For the treatment of malaria, continuous and intermittent infusion regimens have been used. A loading dose is prepared as a dilution in 250 mL of sodium chloride 0.9% and given as a one- or two-hour (continuous regimen) or four-hour (intermittent regimen) infusion.<sup>4</sup>

Infusions of quinidine gluconate must be delivered slowly at a rate no faster than 0.25 mg/kg/min, preferably using a volumetric pump to control the rate of administration.<sup>1(9/06)</sup>

### Stability

Quinidine gluconate should be stored at controlled room temperature.<sup>1(9/06)</sup> Quinidine salts slowly discolor on exposure to light, acquiring a brownish tint. Only clear, colorless solutions are suitable for injection.<sup>4</sup>

### Sorption

A substantial loss of quinidine (as the gluconate) was noted due to sorption to PVC containers and administration sets. Quinidine gluconate 6 mg/mL in dextrose 5% in 100-mL PVC bags (Baxter) exhibited about 5 to 7% loss. Administration of the solution over 30 minutes through 112-inch PVC administration sets (Gemini, IMED) resulted in an additional loss of over 30% of the quinidine gluconate from the delivered solution. Losses totaled over 40% for both bag and catheter. Use of a glass syringe on a syringe pump and a winged administration catheter having only 12 inches of PVC tubing reduced the loss to about 3%.<sup>2005</sup>

In two studies, quinidine (as the sulfate) was shown not to exhibit sorption to PVC bags and tubing, polyethylene tubing, Silastic tubing, and polypropylene syringes.<sup>536 606</sup>

## Quinupristin–Dalfopristin

AHFS 8:12.28.32

### Products

Quinupristin–dalfopristin is available as a lyophilized powder in single-dose vials containing a total of 500 mg of the two pristinamycin derivatives (quinupristin 150 mg and dalfopristin 350 mg).<sup>3229</sup> The 500-mg vial should be reconstituted with 5 mL of dextrose 5% or sterile water for injection and gently swirled (without shaking) to facilitate dissolution while limiting foam formation.<sup>3229</sup> The reconstituted solution should be allowed to sit for a few minutes until all of the foam has dissipated and a clear 100-mg/mL solution has formed; this solution must be diluted for administration.<sup>3229</sup>

The appropriate dose of quinupristin–dalfopristin should be added to an infusion bag containing 250 mL of dextrose 5%.<sup>3229</sup> For central line administration, 100 mL of dextrose 5% may be used for dilution.<sup>3229</sup>

Diluted solutions of quinupristin–dalfopristin for infusion should be visually inspected for particulate matter prior to administration.<sup>3229</sup>

### Trade Name(s)

Synercid

### Administration

Quinupristin–dalfopristin is administered by intravenous infusion over 60 minutes following dilution of the reconstituted solution in dextrose 5%; other infusion rates are not recommended.<sup>3229</sup> An infusion pump or device may be used to control the rate of infusion.<sup>3229</sup>

If moderate-to-severe venous irritation occurs during peripheral administration of the reconstituted solution diluted in 250

mL of dextrose 5%, consideration should be given to increasing the infusion volume to 500 or 750 mL, changing the infusion site, or infusing through a peripherally inserted central catheter (PICC) or central venous catheter.<sup>3229</sup>

If a common infusion line is used for the intermittent infusion of quinupristin–dalfopristin and other drugs, the manufacturer recommends flushing the line with dextrose 5% prior to and following administration of quinupristin–dalfopristin.<sup>3229</sup> The vein also should be flushed with dextrose 5% following completion of peripheral administration of the drug in order to minimize venous irritation; the vein should *not* be flushed with sodium chloride or heparin after drug administration.<sup>3229</sup>

### Stability

Intact vials of quinupristin–dalfopristin should be stored under refrigeration.<sup>3229</sup> Although refrigerated storage is required, one manufacturer has stated that the drug may be stored at room temperature for 7 days.<sup>2745</sup> Because no antimicrobial preservative is present, the manufacturer recommends dilution of the reconstituted solution within 30 minutes.<sup>3229</sup> Quinupristin–dalfopristin diluted for infusion in dextrose 5% is stated to be stable for 5 hours at room temperature and 54 hours at 2 to 8°C.<sup>3229</sup>

Use of sodium chloride-containing solutions for dilution or flushing is not recommended because of incompatibility.<sup>3229</sup>

### Freezing Solutions

Diluted solutions of quinupristin–dalfopristin for infusion should not be frozen.<sup>3229</sup>

# Ranitidine Hydrochloride

## AHFS 56:28.12

### Products

Ranitidine hydrochloride is available in 2-mL single-dose vials,<sup>3497 3512</sup> 6-mL multiple-dose vials,<sup>3497 3512</sup> and 40-mL pharmacy bulk packages.<sup>3498</sup> Each mL of solution contains ranitidine (as the hydrochloride) 25 mg, phenol 5 mg, dibasic sodium phosphate 2.4 mg, and monobasic potassium phosphate 0.96 mg.<sup>3497 3498 3512</sup>

### Equivalency

Ranitidine hydrochloride 28 mg is approximately equivalent to 25 mg of ranitidine.<sup>3497 3498</sup>

### pH

The pH of the injection solution ranges from 6.7 to 7.3.<sup>3497 3498</sup>

### Osmolality

The osmolality of ranitidine hydrochloride 10 mg/mL was determined to be 59 mOsm/kg.<sup>1233</sup>

The osmolality of ranitidine hydrochloride (Glaxo) 1 mg/mL was 260 mOsm/kg in dextrose 5% and 302 mOsm/kg in sodium chloride 0.9%.<sup>1375</sup> At 2 mg/mL, the osmolality was 257 mOsm/kg in dextrose 5% and 294 mOsm/kg in sodium chloride 0.9%.<sup>1375</sup>

### Trade Name(s)

Zantac

### Administration

Ranitidine hydrochloride is administered intravenously after dilution.<sup>3497 3497 3512</sup> For intravenous injection, 50 mg should be diluted to a total volume of at least 20 mL (i.e., to a concentration no greater than 2.5 mg/mL) with a compatible infusion solution and administered over at least 5 minutes.<sup>3497 3498 3512</sup> For intermittent intravenous infusion, 50 mg should be diluted to a total volume of at least 100 mL (i.e., to a concentration no greater than 0.5 mg/mL) with a compatible infusion solution and infused over at least 15 to 20 minutes.<sup>3497 3498 3512</sup> For continuous intravenous infusion, ranitidine hydrochloride also should be diluted in a compatible infusion solution (e.g., 150 mg in 250 mL); for some indications where administration by continuous infusion is recommended, the manufacturers recommend dilution to a concentration no greater than 2.5 mg/mL.<sup>3497 3498 3512</sup>

Ranitidine hydrochloride also is administered intramuscularly.<sup>3497 3498 3512</sup> Dilution of the drug is not required for intramuscular administration.<sup>3497 3498 3512</sup>

### Stability

Ranitidine hydrochloride injection should be stored between 4 and 25°C<sup>3497 3498</sup> or 20 and 25°C<sup>3512</sup> with excursions permitted to 30°C.<sup>3497</sup> Vials should be protected from light and excessive heat.<sup>3497 3498 3512</sup> Brief exposure to temperatures up to 40°C will not adversely affect the stability of the injection.<sup>3497 3512</sup> However,

ranitidine hydrochloride injection has been reported to form an unacceptable brown discoloration if stored at 40°C or higher for several months.<sup>2505</sup> The product is a clear, colorless to yellow solution.<sup>3497 3498 3512</sup> Manufacturers note that the yellow color of the undiluted drug may intensify over time without adversely affecting the potency of the product.<sup>3497 3498 3512</sup>

Ranitidine hydrochloride (Glaxo) diluted to a concentration of 2.5 mg/mL with preserved sterile water for injection and repackaged in 30-mL glass vials was stored at 4°C for 91 days.<sup>1965</sup> Approximately 5% loss occurred after 91 days of storage under refrigeration.<sup>1965</sup>

Ranitidine hydrochloride (GlaxoSmithKline) 25 mg/mL was repackaged as 2.2 mL in glass vials and stored for 6 months at 5°C protected from light and 25°C both protected from and exposed to light.<sup>3495</sup> While solutions were colorless to slightly yellow initially, some samples turned more yellow over time, and this change was especially apparent in samples exposed to light.<sup>3495</sup> Color changes were not associated with a decrease in ranitidine concentration, and little loss of the drug occurred in 6 months at any of the storage conditions tested.<sup>3495</sup>

### Freezing Solutions

Manufacturers state that the drug should be protected from freezing.<sup>3497 3498 3512</sup>

Ranitidine hydrochloride (Glaxo) 0.5, 1, and 2 mg/mL in dextrose 5% and sodium chloride 0.9% in polyvinyl chloride (PVC) bags showed no change in appearance or concentration when frozen for 30 days at -30°C.<sup>1143</sup> An additional 14 days of refrigerated storage at 4°C for these previously frozen solutions also resulted in no loss.<sup>1143</sup> At a concentration of 2 mg/mL in dextrose 5% and sodium chloride 0.9% in PVC containers, no change in appearance or drug loss occurred after 100 days of storage at -30°C.<sup>1143</sup>

The stability of ranitidine hydrochloride (Glaxo) 0.5, 1, and 2 mg/mL in several infusion fluids frozen at -20°C for 60 days followed by 7 days at 23°C or 14 days at 4°C was studied. In dextrose 5% in sodium chloride 0.45%, dextrose 5%, dextrose 10%, and sodium chloride 0.9%, ranitidine was physically compatible and chemically stable, retaining more than 90% of the initial concentration under these storage conditions. However, in dextrose 5% in Ringer's injection, lactated, the thawed solutions were slightly yellow with ranitidine hydrochloride losses of 25, 16, and 9% at 0.5, 1, and 2 mg/mL, respectively.<sup>1516</sup>

Ranitidine hydrochloride (Glaxo) 1.5 mg/mL in dextrose 5% or in sodium chloride 0.9% was packaged in PVC infusion pump reservoirs. The reservoirs were stored at -20°C for 30 days. The frozen solutions were then thawed by storing at 3°C for 24 hours followed by 24 hours at 30°C to simulate use conditions. No loss was found.<sup>1865</sup>

## Syringes

Ranitidine hydrochloride (Glaxo) was diluted to a concentration of 2.5 mg/mL with preserved sterile water for injection and repackaged in 10-mL polypropylene syringes (Becton Dickinson).<sup>1965</sup> Approximately 6% loss occurred after 91 days of storage at 4°C.<sup>1965</sup> Freshly prepared syringes and syringes initially stored at 4°C for 91 days also were stored at 22°C for 72 hours.<sup>1965</sup> No loss was found in the freshly prepared syringes, and about 2% additional loss was found in syringes initially stored under refrigeration for 91 days.<sup>1965</sup>

Ranitidine hydrochloride (GlaxoSmithKline) 5 mg/mL in sodium chloride 0.9% repackaged as 5 mL in polypropylene syringes (Becton Dickinson) exhibited less than 10% loss after storage for 91 days at 5°C protected from light and at 25°C both protected from light and exposed to light.<sup>3495</sup> While solutions were colorless to slightly yellow initially, some samples turned more yellow over time, and this change was especially apparent in certain samples (e.g., those exposed to light, undiluted

25-mg/mL samples).<sup>3495</sup> Such color changes were not associated with a decrease in ranitidine concentration.<sup>3495</sup>

## Filtration

Filtration of ranitidine hydrochloride (Glaxo) 0.25, 0.5, and 2.5 mg/mL in sodium chloride 0.9% through 0.2- $\mu$ m polysulfone filters (IVS Set-P Supor Filter, Codan) at a rate of 4 mL/hr for 5 hours did not result in any loss of drug due to sorption to the filter.<sup>2229</sup>

## Central Venous Catheter

Ranitidine hydrochloride (Glaxo Wellcome) 0.2 mg/mL in dextrose 5% was found to be compatible with the ARROW-g+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

TNA #245 <sup>d</sup>			200 mg	No ranitidine loss and no lipid change in 24 hr at room temperature	486	C
TNA #246 <sup>d</sup>		GL	72 mg	Less than 7% ranitidine loss and no change in emulsion integrity in 14 days at 4°C	501	C
TPN #58 <sup>d</sup>		GL	83, 167, 250 mg	10% ranitidine loss in 48 hr at 23°C	997	C
TPN #59, #60 <sup>d</sup>	<sup>a</sup>	GL	50 and 100 mg	No color change and 7 to 9% ranitidine loss in 24 hr at 24°C in light. Amino acids unaffected. Darkened color and 10 to 12% ranitidine loss in 48 hr	1010	C

**Solution Compatibility (Cont.)**

Test Soln Name	Mfr	Mfr	Conc/L or %	Remarks	Ref	C/I
TPN #117 <sup>d</sup>		GL	50 and 100 mg	Physically compatible and 5% ranitidine loss in 48 hr refrigerated and at 25°C	1360	C
TPN #196 <sup>d</sup>		GL	75 mg	Physically compatible with 7% or less ranitidine loss in 24 hr at 22°C in light. About 12% loss in 48 hr	1921	C
TPN #247 <sup>d</sup>		GL	72 mg	2% ranitidine loss in 14 days at 4°C	501	C

<sup>a</sup> Tested in PVC containers.

<sup>b</sup> Tested in polyethylene and glass containers.

<sup>c</sup> Tested in ethylene vinyl acetate containers.

<sup>d</sup> Refer to Appendix for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

**Additive Compatibility****Ranitidine HCl**

Gentamicin sulfate		160 mg	GL	100 mg	D5W	Physically compatible for 24 hr at ambient temperature in light	1151	C
Gentamicin sulfate		80 mg	GL	50 mg and 2 g	D5W, NS	Physically compatible. Ranitidine stable for 24 hr at 25°C. Gentamicin not tested	1515	C
Heparin sodium	ES	10,000 and 40,000 units	GL	2 g	D5W, NS <sup>a</sup>	Physically compatible. 2% ranitidine loss in 48 hr at room temperature in light. Heparin not tested	1361	C
Heparin sodium	ES	10,000 and 40,000 units	GL	50 mg	NS <sup>a</sup>	Physically compatible. No ranitidine loss in 48 hr at room temperature in light. Heparin not tested	1361	C
Heparin sodium	ES	10,000 and 40,000 units	GL	50 mg	D5W <sup>a</sup>	Physically compatible. 7% ranitidine loss in 24 hr and 12% loss in 48 hr at room temperature in light. Heparin not tested	1361	C
Insulin, regular	LI	1000 units	GL	600 mg	NS <sup>a</sup>	Visually compatible. Little ranitidine loss in 24 hr at ambient temperature but insulin losses of 9% in 4 hr and 14% in 24 hr, presumably due to sorption	2079	I
Isoproterenol HCl		20 mg	GL	50 mg and 2 g	D5W	Physically compatible. Ranitidine stable for 24 hr at 25°C. Isoproterenol not tested	1515	C
Lidocaine HCl	AST	1 and 8 g	GL	50 mg and 2 g	D5W, NS <sup>a</sup>	Physically compatible. 3% ranitidine loss in 24 hr at room temperature in light. Lidocaine not tested	1361	C
Lidocaine HCl		2.5 g	GL	50 mg and 2 g	D5W	Physically compatible. Ranitidine stable for 24 hr at 25°C. Lidocaine not tested	1515	C
Lidocaine HCl	AST	1 and 8 g	GL	50 mg and 2 g	D5W, NS <sup>a</sup>	Visually compatible. Little loss of either drug in 48 hr at room temperature	1802	C
Lincomycin HCl		2.4 g	GL	50 mg and 2 g	D5W	Physically compatible. Ranitidine stable for 24 hr at 25°C. Lincomycin not tested	1515	C
Meropenem	ZEN	1 and 20 g	GL	100 mg	NS	Visually compatible for 4 hr at room temperature	1994	C
Methylprednisolone sodium succinate	UP	40 mg	GL	50 mg	D5W <sup>a</sup>	Visually compatible with 7% ranitidine loss and no methylprednisolone loss in 48 hr at room temperature	1802	C
Methylprednisolone sodium succinate	UP	2 g	GL	50 mg	D5W <sup>a</sup>	Visually compatible with 6% ranitidine loss and 10% methylprednisolone loss in 48 hr at room temperature	1802	C
Methylprednisolone sodium succinate	UP	40 mg and 2 g	GL	2 g	D5W <sup>a</sup>	Visually compatible with no loss of either drug in 48 hr at room temperature	1802	C
Methylprednisolone sodium succinate	UP	40 mg and 2 g	GL	50 mg and 2 g	NS <sup>a</sup>	Visually compatible with no ranitidine loss and about 10% methylprednisolone loss in 48 hr at room temperature	1802	C
Metoclopramide HCl	SZ	185 mg	GSK	926 mg	NS	Visually compatible for up to 72 hr at room temperature (about 25°C)	3496	C
Midazolam HCl	RC	50 and 250 mg	GL	400 mg	NS	Visually compatible for 4 hr	355	C
Norepinephrine bitartrate	WI	4 and 8 mg	GL	50 mg	D5W, NS <sup>a</sup>	Physically compatible. 2 to 6% ranitidine loss in 48 hr at room temperature in light. Norepinephrine not tested	1361	C
Norepinephrine bitartrate		4 mg	GL	50 mg	D5W	Physically compatible. Ranitidine stable for 24 hr at 25°C. Norepinephrine not tested	1515	C
Norepinephrine bitartrate	RC	4 and 8 mg	GL	50 mg	D5W <sup>a</sup>	Visually compatible. 5 to 7% ranitidine loss and little norepinephrine loss in 48 hr at room temperature	1802	C
Norepinephrine bitartrate	RC	4 mg	GL	2 g	D5W <sup>a</sup>	Visually compatible. 7% norepinephrine loss in 4 hr and 13% in 12 hr at room temperature. No ranitidine loss in 48 hr	1802	I

## Rasburicase

AHFS 44:00

### Products

Rasburicase is available as a lyophilized powder in single-use vials containing 1.5 or 7.5 mg of the drug.<sup>3135</sup> Each 1.5-mg vial also contains mannitol 10.6 mg, L-alanine 15.9 mg, and dibasic sodium phosphate in the range of 12.6 to 14.3 mg.<sup>3135</sup> Each 7.5-mg vial also contains mannitol 53 mg, L-alanine 79.5 mg, and dibasic sodium phosphate in the range of 63 to 71.5 mg.<sup>3135</sup> Each 1.5- or 7.5-mg vial of rasburicase is packaged with an ampul of special diluent containing 1 or 5 mL of water for injection, respectively, and poloxamer 188 1 or 5 mg, respectively.<sup>3135</sup>

The 1.5- and 7.5-mg vials of rasburicase must be reconstituted with 1 and 5 mL of the provided special diluent, respectively, for a solution with a final rasburicase concentration of 1.5 mg/mL.<sup>3135</sup> Vials should be gently swirled until the contents are dissolved and should not be shaken or mixed so vigorously as to form a vortex.<sup>3135</sup> Reconstituted solutions should be visually inspected for particulate matter prior to administration; if particulate matter is present or discoloration occurs, the solution should be discarded.<sup>3135</sup> The appropriate dose of rasburicase should be withdrawn from the vial of reconstituted solution and further diluted in an infusion bag containing sodium chloride 0.9% to achieve a final total volume of 50 mL in the infusion bag.<sup>3135</sup>

### Trade Name(s)

Blinatumomab	AMG	0.375 mcg/mL <sup>a</sup>	SAA	0.15 mg/mL <sup>a</sup>	Flakes transiently appear when rasburicase is added to blinatumomab; not observed when order of mixing was reversed	3405, 3417	?

<sup>a</sup> Tested in sodium chloride 0.9%.

© Copyright, June 2018. American Society of Health-System Pharmacists, Inc.

DOI: 10.37573/9781585286850.337

### Administration

Rasburicase is administered intravenously as an infusion over 30 minutes following dilution of the reconstituted solution.<sup>3135</sup> Rasburicase should be infused through a separate line, or, if a common infusion line is being used to administer other drugs in addition to rasburicase, the line should be flushed with at least 15 mL of sodium chloride 0.9% prior to and following infusion of rasburicase.<sup>3135</sup> Rasburicase should *not* be administered by bolus injection.<sup>3135</sup>

### Stability

Rasburicase is a white to off-white powder.<sup>3135</sup> Intact vials of rasburicase and accompanying ampuls of special diluent should be stored at 2 to 8°C and protected from light and freezing.<sup>3135</sup>

The reconstituted solution or solutions diluted for infusion in sodium chloride 0.9% should be stored at 2 to 8°C; reconstituted and diluted solutions should be discarded 24 hours after reconstitution.<sup>3135</sup>

### Filtration

Filters should not be used during reconstitution or infusion of rasburicase.<sup>3135</sup>

## Remdesivir

### AHFS 8:18.32

#### Products

Remdesivir is available in 2 different formulations: a lyophilized powder and a concentrate for injection.<sup>3581</sup> The lyophilized powder is available in single-dose (preservative-free) vials packaged under vacuum containing 100 mg of remdesivir and 3 g of betadex sulfobutyl ether sodium.<sup>3581</sup> Vials also may contain hydrochloric acid and/or sodium hydroxide for pH adjustment.<sup>3581</sup>

The contents of each 100-mg vial of lyophilized powder should be reconstituted only with 19 mL of sterile water for injection using an appropriately-sized syringe and needle; vials should be discarded if the vacuum does not draw the diluent into the vial.<sup>3581</sup> Immediately after adding the sterile water for injection, vials should be shaken for 30 seconds, then the contents allowed to settle for 2 to 3 minutes.<sup>3581</sup> If the contents are not completely dissolved, the vial should be shaken again for 30 seconds and the contents allowed to settle for 2 to 3 minutes.<sup>3581</sup> This procedure should be repeated as necessary until the contents of the vial are completely dissolved and a clear solution results.<sup>3581</sup> The vial should be discarded if the contents are not completely dissolved.<sup>3581</sup> The resulting reconstituted solution has a remdesivir concentration of 5 mg/mL.<sup>3581</sup> The reconstituted solution must be diluted in sodium chloride 0.9% prior to administration.<sup>3581</sup> The reconstituted solution should be visually inspected for particulate matter and discoloration prior to dilution.<sup>3581</sup> The reconstituted solution should be used to prepare the diluted solution for infusion.<sup>3581</sup>

For adults and pediatric patients 12 years of age or older and weighing at least 40 kg, loading and maintenance doses of remdesivir must be diluted in either 100- or 250-mL bags of sodium chloride 0.9% after first removing and discarding a volume of infusion fluid equal to the volume of the appropriate dose of the reconstituted solution to be added.<sup>3581</sup>

Remdesivir also is available as a 5-mg/mL concentrate for injection in single-dose (preservative-free) vials containing 20 mL of the concentrate for injection.<sup>3581</sup> Vials contain 6 g of betadex sulfobutyl ether sodium and water for injection; hydrochloric acid and/or sodium hydroxide also may be present to adjust the pH.<sup>3581</sup> The concentrate for injection must be diluted only in sodium chloride 0.9% prior to administration.<sup>3581</sup> Prior to dilution, the vials should be allowed to come to room temperature (20 to 25°C).<sup>3581</sup> Vials should be visually inspected to ensure that the container closure is free of defects and that the solution is free of particulate matter and discoloration.<sup>3581</sup>

For adults and pediatric patients 12 years of age or older and weighing at least 40 kg, loading and maintenance doses of remdesivir must be diluted in 250-mL bags of sodium chloride 0.9% after first removing and discarding a volume of infusion fluid equal to the volume of the appropriate dose of the concentrate for injection to be added.<sup>3581</sup> To withdraw the concentrate

for injection from the vial, the plunger rod of an appropriately sized syringe should be pulled back to fill the syringe with approximately 10 mL of air.<sup>3581</sup> The air should be injected into the vial above the level of the solution.<sup>3581</sup> The vial should then be inverted in order to withdraw the appropriate dose of the concentrate for injection; withdrawal of the final 5 mL of solution remaining in the vial requires more force.<sup>3581</sup> After adding the concentrate for injection to the infusion bag, the bag should be gently inverted 20 times to mix the solution; the bag should not be shaken.<sup>3581</sup>

Information on use of the drug in populations not described in the product labeling may be available at [www.FDA.gov](http://www.FDA.gov).

#### Trade Name(s)

Veklury

#### Administration

Remdesivir must be administered by intravenous infusion only; the drug should *not* be administered by any other route.<sup>3581</sup> Remdesivir solutions prepared as directed in sodium chloride 0.9% should be infused over 30 to 120 minutes.<sup>3581</sup>

#### Stability

The lyophilized formulation of remdesivir is a white to off-white to yellow powder that forms a clear solution upon reconstitution.<sup>3581</sup> Intact vials of remdesivir lyophilized powder should be stored below 30°C.<sup>3581</sup> The reconstituted solution should be used immediately after preparation to prepare the diluted solution for infusion.<sup>3581</sup>

Remdesivir concentrate for injection is a clear, colorless to yellow solution free of visible particulates.<sup>3581</sup> Intact vials of remdesivir concentrate for injection should be stored at 2 to 8°C; however, intact vials may be stored at room temperature (20 to 25°C) for up to 12 hours prior to dilution.<sup>3581</sup>

Because no preservatives are present in either formulation, any unused solution remaining in a vial after preparation of the diluted solution for infusion should be discarded.<sup>3581</sup> The diluted solution for infusion should be visually inspected for particulate matter and discoloration prior to administration; if particulate matter is present or discoloration occurs, the diluted solution for infusion should be discarded.<sup>3581</sup> Diluted solutions for infusion may be stored for up to 24 hours at room temperature (20 to 25°C) or 48 hours at 2 to 8°C; however, the manufacturer recommends always administering the diluted solution for infusion immediately after preparation when possible.<sup>3581</sup> The manufacturer also recommends that diluted solutions for infusion prepared with either formulation should be administered within the same day as dilution.<sup>3581</sup>

The manufacturer states that remdesivir should not be administered simultaneously with any other drugs.<sup>3581</sup>

## Remifentanil Hydrochloride

AHFS 28:08.08

### Products

Remifentanil hydrochloride is available as a lyophilized powder in single-dose (preservative-free) vials containing 1, 2, or 5 mg of remifentanil base present as the hydrochloride.<sup>3463</sup> Each vial also contains glycine 15 mg and hydrochloric acid for pH adjustment.<sup>3463</sup> The contents of the vials should be reconstituted using 1 mL of a compatible diluent for each milligram of remifentanil base; vials should be shaken well to dissolve the powder, yielding a reconstituted solution with an approximate remifentanil concentration of 1 mg/mL.<sup>3463</sup> The reconstituted solution should be further diluted in a compatible diluent to a recommended final remifentanil concentration of 20, 25, 50, or 250 mcg/mL prior to administration.<sup>3463</sup> Remifentanil hydrochloride should *not* be administered without dilution.<sup>3463</sup>

### pH

The reconstituted solution has a pH ranging from 2.5 to 3.5.<sup>3463</sup>

### Trade Name(s)

Ultiva

### Administration

Remifentanil hydrochloride is administered intravenously only.<sup>3463</sup> Administration of the drug by the epidural or intrathecal route is contraindicated due to the presence of glycine in the formulation.<sup>3463</sup>

Single intravenous doses may be administered over 30 to 60 seconds.<sup>3463</sup> Remifentanil hydrochloride also may be administered by continuous intravenous infusion using an infusion device.<sup>3463</sup> The manufacturer recommends that injection or infusion of the

drug be made at or near the venous cannula and that all tubing be cleared at the time the infusion is discontinued.<sup>3463</sup> Bolus doses and continuous infusion should not be administered simultaneously to spontaneously breathing patients.<sup>3463</sup>

### Stability

Remifentanil hydrochloride is a white to off-white lyophilized powder that forms a clear, colorless solution upon reconstitution.<sup>3463</sup> Intact vials should be stored between 2 and 25°C.<sup>3463</sup>

The solution should be visually inspected for particulate matter and discoloration prior to administration; if particulate matter is present or discoloration occurs, the solution should not be used.<sup>3463</sup> Vials are for single dose and do not contain preservatives; unused portions should be discarded.<sup>3463</sup>

### Syringes

In 2015, reports of decreased potency of certain drugs (e.g., remifentanil hydrochloride) stored in Becton Dickinson syringes for extended periods (i.e., exceeding 24 hours) were confirmed by the manufacturer of these syringes; the cause of this change was later identified to be the inclusion of an alternate rubber stopper in the plunger of certain product lots of syringes.<sup>3029 3036 3037 3039 3041 3042</sup> Decreased potency was not observed when the syringes were filled and used promptly.<sup>3037</sup> Use of the alternate stopper was later discontinued and use of the primary stopper in such syringes was resumed; however, Becton Dickinson states that its general-use syringes are cleared by FDA for immediate use in fluid aspiration and injection and that such syringes, regardless of the stopper material, have not been cleared by FDA for use as a closed-container system.<sup>3391</sup>

## Additional Compatibility Information

### *Other Drugs*

The manufacturer states that remifentanil hydrochloride (Ultiva, Mylan) has been shown to be compatible with propofol (Diprivan, Fresenius Kabi) when the 2 drugs are coadministered into a running intravenous administration set.<sup>3463</sup>

Selected Revisions January 31, 2020. © Copyright, October 2000. American Society of Health-System Pharmacists, Inc.

## Reteplase

AHFS 20:12.20

### Products

Reteplase is available as a lyophilized powder in 10.4-unit (18.1-mg) vials; the slight overfill is to ensure that 10 units of drug can be delivered. The vials are packaged with sterile water for injection diluent in kits containing 2 vials of drug and diluent along with syringes, needles, alcohol swabs, and dispensing pins and in half-kits with a single vial of drug and diluent with a dispensing pin. Each vial also contains tranexamic acid 8.32 mg, dipotassium hydrogen phosphate 136.24 mg, phosphoric acid 51.27 mg, sucrose 364 mg, and polysorbate 80 5.2 mg.<sup>1(11/06)</sup>

Reconstitute the reteplase vials using the diluent and dispensing pin provided. Other solutions should not be used to reconstitute the drug. Swirl gently to dissolve the drug yielding a 1-unit/mL solution. Do not shake. If slight foaming occurs, the vials should be allowed to stand for several minutes to dissipate large bubbles.<sup>1(11/06)</sup> 4

### pH

The reconstituted solution has a pH from 5.7 to 6.3.<sup>1(11/06)</sup>

### Trade Name(s)

Retavase

## Compatibility Information

### Y-Site Injection Compatibility (1:1 Mixture)

#### Reteplase

Test Drug	Mfr	Conc	Mfr	Conc	Remarks	Ref	C/I
Bivalirudin	TMC	5 mg/mL <sup>a</sup>	CEN	1 unit/mL <sup>a</sup>	Small aggregates form immediately	2373	I
Cangrelor tetrasodium	TMC	1 mg/mL <sup>b</sup>		1 unit/mL	Cloudy white precipitate with fluffy particulates forms immediately	3243	I

<sup>a</sup> Tested in dextrose 5%.

<sup>b</sup> Tested in sodium chloride 0.9%.

Selected Revisions September 29, 2017. © Copyright, October 2004. American Society of Health-System Pharmacists, Inc.

### Administration

Reteplase is administered intravenously as a double bolus injection, each injection delivered over 2 minutes. The second injection is given 30 minutes after completion of the first injection. The manufacturer recommends no other drugs be administered in the line used to deliver reteplase.<sup>1(11/06)</sup>

### Stability

Intact packages should be stored between 2 and 25°C. The boxes should stay sealed until use to protect from light. Because no antimicrobial preservatives are present, the manufacturer recommends reconstitution immediately before use. The colorless reconstituted solution may be used for up to 4 hours after reconstitution when stored between 2 and 30°C.<sup>1(11/06)</sup>

Reteplase is incompatible with heparin sodium. If mixed in the same container or run into the same line as heparin sodium, a solid or semisolid mass may form. However, heparin sodium may be administered sequentially with reteplase into the same line used to deliver reteplase if the line is adequately flushed with sodium chloride 0.9% or dextrose 5% both before and after reteplase administration.<sup>1(11/06)</sup>

## Rifampin

AHFS 8:16.04

### Products

Rifampin is available as a lyophilized powder in vials containing rifampin 600 mg, sodium formaldehyde sulfoxylate 10 mg, and sodium hydroxide to adjust the pH. Reconstitute with 10 mL of sterile water for injection; swirl gently to dissolve the vial contents for a 60-mg/mL solution.<sup>1(7/08)</sup>

### Trade Name(s)

Rifadin I.V.

### Administration

Rifampin is administered by intravenous infusion. It must not be given intramuscularly or subcutaneously, and extravasation

should be avoided. The reconstituted solution may be diluted in 500 mL of dextrose 5% or sodium chloride 0.9% and infused over three hours. Alternatively, the desired dose may be diluted in 100 mL and administered over 30 minutes.<sup>1(7/08) 4</sup>

### Stability

Rifampin powder is reddish brown. Intact vials should be stored at room temperature and protected from excessive heat and light. The reconstituted solution is stable for 24 hours at room temperature.<sup>1(7/08)</sup>

## Compatibility Information

## Rituximab

### AHFS 10:00

### Products

Rituximab is available as a preservative-free 10-mg/mL concentrate solution in 100- and 500-mg single-use vials.<sup>3083</sup> Each mL also contains polysorbate 80 0.7 mg, sodium chloride 9 mg, sodium citrate dihydrate 7.35 mg, and water for injection.<sup>3083</sup>

Before preparing a solution for intravenous infusion, rituximab vials should be visually inspected for particulate matter or discoloration; vials should not be used if particulates or discoloration is present.<sup>3083</sup> The appropriate dose of rituximab should be withdrawn and diluted in an infusion bag containing sodium chloride 0.9% or dextrose 5% to yield a final concentration of 1 to 4 mg/mL.<sup>3083</sup> The bag should be gently inverted to mix the solution.<sup>3083</sup> Any unused portion remaining in the vial should be discarded.<sup>3083</sup>

### pH

6.5.<sup>3083</sup>

### Osmolality

Rituximab is nearly isotonic with an osmolality of approximately 360 mOsm/kg.<sup>3085</sup>

### Trade Name(s)

Rituxan, MabThera

### Administration

Rituximab is administered only by intravenous infusion after dilution in dextrose 5% or sodium chloride 0.9%.<sup>3083</sup> The drug should *not* be administered by intravenous push or bolus injection.<sup>3083</sup> Patients should receive appropriate premedications as indicated.<sup>3083</sup>

The first infusion should be initiated at a rate of 50 mg/hr.<sup>3083</sup> In the absence of infusion toxicity, the rate may be increased every 30 minutes in increments of 50 mg/hr to a maximum rate of 400 mg/hr.<sup>3083</sup> Subsequent standard infusions may be

initiated at 100 mg/hr and, in the absence of infusion toxicity, the rate may be increased every 30 minutes in increments of 100 mg/hr to a maximum rate of 400 mg/hr.<sup>3083</sup> Certain patients treated for specific indications may be eligible for a 90-minute subsequent infusion (i.e., 20% of the dose administered over 30 minutes followed by the remaining 80% administered over 60 minutes); specific product labeling should be consulted for additional administration details.<sup>3083</sup>

### Stability

Rituximab concentrate is a clear, colorless solution.<sup>3083</sup> Intact vials are stable at 2 to 8°C.<sup>3083</sup> Vials should be protected from direct sunlight and should not be frozen or shaken.<sup>3083</sup>

Rituximab solutions diluted for infusion may be stored for 24 hours at 2 to 8°C.<sup>3083</sup> Diluted solutions have demonstrated stability for an additional 24 hours at room temperature; however, since such solutions do not contain a preservative, the manufacturer recommends that diluted solutions be stored under refrigeration at 2 to 8°C.<sup>3083</sup>

### Sorption

No incompatibilities have been observed with rituximab and bags composed of polyvinyl chloride (PVC) or polyethylene.<sup>3083</sup> The manufacturer states that the use of containers other than those made of PVC or polyethylene (e.g., evacuated glass bottles) with rituximab has not been evaluated and is therefore not recommended.<sup>3085</sup>

### Filtration

Use of an inline filter is not required for administration of rituximab-containing solutions.<sup>3085</sup> Based on the results of a study evaluating the effects of using a 0.2- $\mu$ m inline filter to administer various concentrations of diluted rituximab, inadvertent use of an inline filter is not expected to be problematic.<sup>3085</sup>

## Compatibility Information

## Rocuronium Bromide

AHFS 12:20.20

### Products

Rocuronium bromide is available in 5- and 10-mL vials. Each mL contains rocuronium bromide 10 mg with sodium acetate 2 mg, sodium chloride for isotonicity, and acetic acid and/or sodium hydroxide to adjust the pH.<sup>1(9/08)</sup>

### pH

Adjusted during manufacture to pH 4.<sup>1(9/08)</sup>

### Tonicity

The injection is isotonic.<sup>1(9/08)</sup>

### Trade Name(s)

Zemuron

### Administration

Rocuronium bromide is administered intravenously only by rapid intravenous injection or by intravenous infusion when admixed in an appropriate intravenous infusion solution. Infusion rates should be individualized for each patient according to the requirements and response.<sup>1(9/08)</sup> 4

### Stability

Intact vials of rocuronium bromide should be stored under refrigeration at 2 to 8°C and protected from freezing. Intact vials stored at room temperature should be used within 60 days. Opened vials should be used within 30 days.<sup>1(9/08)</sup>

### Syringes

In 2015, reports of decreased potency of certain drugs (e.g., rocuronium bromide) stored in Becton Dickinson syringes for extended periods (i.e., exceeding 24 hours) were confirmed by the manufacturer of these syringes; the cause of this change was later identified to be the inclusion of an alternate rubber stopper in the plunger of certain product lots of syringes.<sup>3029 3036 3037 3039 3041 3042</sup> Decreased potency was not observed when the syringes were filled and used promptly.<sup>3037</sup> Use of the alternate stopper was later discontinued and use of the primary stopper in such syringes was resumed; however, Becton Dickinson states that its general-use syringes are cleared by FDA for immediate use in fluid aspiration and injection and that such syringes, regardless of the stopper material, have not been cleared by FDA for use as a closed-container system.<sup>3391</sup>

# Rolapitant Hydrochloride

AHFS 56:22.32

## Products

Rolapitant hydrochloride is available as a ready-to-use emulsion in single-dose vials that contain 166.5 mg of rolapitant as the free base in 92.5 mL of the emulsion.<sup>3370 3371</sup> Each mL of the injectable emulsion contains rolapitant 1.8 mg, dibasic sodium phosphate anhydrous 2.8 mg, medium-chain triglycerides 11 mg, polyoxyl 15 hydroxystearate 44 mg, sodium chloride 6.2 mg, and soybean oil 6.5 mg in water for injection.<sup>3370</sup> The injectable emulsion also may contain hydrochloric acid and/or sodium hydroxide to adjust the pH.<sup>3370</sup>

## Equivalency

Rolapitant hydrochloride 185 mg is equivalent to 166.5 mg of rolapitant as the free base.<sup>3370 3372</sup>

## pH

From 7 to 8.<sup>3370</sup>

## Trade Name(s)

Varubi

## Administration

For rolapitant doses of 166.5 mg (92.5 mL), the dose should be administered by inserting a conventional vented intravenous infusion set directly into the septum of the 100-mL vial.<sup>3370 3371</sup> (See Stability: Compatible Administration Sets.)

Rolapitant hydrochloride injectable emulsion should be administered by intravenous infusion over 30 minutes using an infusion pump.<sup>3370 3371</sup>

The manufacturer states that the injectable emulsion should not be diluted.<sup>3370</sup> (See Additional Compatibility Information.)

## Stability

Rolapitant hydrochloride injectable emulsion is translucent and white with some opalescence.<sup>3370</sup> The emulsion is homogenous

and does not require shaking.<sup>3370</sup> Intact vials should be stored at controlled room temperature.<sup>3370</sup>

Vials should be inspected for particulate matter and discoloration prior to administration; if particulate matter is present or discoloration has occurred, the vial should be discarded.<sup>3370</sup> Vials also should not be used if contamination is suspected.<sup>3370</sup> Once the vial stopper has been punctured for administration, infusion of the drug should begin immediately.<sup>3370</sup>

## Compatible Administration Sets

Rolapitant hydrochloride injectable emulsion was found to be compatible with the administration sets listed in Table 1 for 20 hours at 2 to 8°C, followed by 2 or 8 hours at ambient conditions.<sup>3371</sup> Admixtures of rolapitant hydrochloride with dexamethasone sodium phosphate or palonosetron hydrochloride also were found to be compatible with the administration sets listed in Table 1 for 7 hours at 20 to 25°C followed by 20 hours at 2 to 8°C.<sup>3372 3373</sup>

**Table 1. Administration sets compatible with rolapitant hydrochloride injectable emulsion**<sup>3371 3372 3373</sup>

Manufacturer	Administration Set
CareFusion	Smartsite low-sorbing diethylhexyl phthalate (DEHP)- and latex-free polyethylene secondary set (10014881) Polyvinyl chloride (PVC) (with DEHP) latex-free secondary set (72213N)
Codan	DEHP- and latex-free PVC and polyethylene universal intravenous administration set (A415N)
Medline Industries	DEHP- and latex-free PVC intravenous secondary set with hanger folded extension (DYNDTN1540A)

<sup>a</sup> Tested in cyclic olefin copolymer (COC) and glass containers.

## Additional Compatibility Information

### Infusion Solutions

The manufacturer states that rolapitant hydrochloride injectable emulsion should not be diluted; however, the drug may be administered via Y-site connection with sodium chloride 0.9%; dextrose 5%; dextrose 5% in Ringer's injection, lactated; and Ringer's injection, lactated.<sup>3370</sup>

© Copyright, April 2018. American Society of Health-System Pharmacists, Inc.

# Ropivacaine Hydrochloride

AHFS 72:00

## Products

Ropivacaine hydrochloride is available in concentrations of 2 mg/mL (0.2%), 5 mg/mL (0.5%), 7.5 mg/mL (0.75%), and 10 mg/mL (1%) along with sodium chloride for isotonicity and sodium hydroxide and/or hydrochloric acid for pH adjustment in water for injection. The products are packaged in single-dose glass vials and in polypropylene plastic ampuls designed to fit Luer-lock and Luer-slip syringes. The 2-mg/mL concentration is also available in 100 and 200-mL infusion bottles. Sterile-Pak products should be selected when a container having a sterile outside is required.<sup>1(4/06)</sup>

## pH

From 4 to 6.5.<sup>404</sup>

## Tonicity

Ropivacaine hydrochloride injections are isotonic.<sup>1(4/06)</sup>

## Specific Gravity

The specific gravities of ropivacaine hydrochloride injections range from 1.002 to 1.005 at 25°C.<sup>1(4/06)</sup>

## Trade Name(s)

Naropin

## Administration

Ropivacaine hydrochloride is administered parenterally by lumbar epidural injection or infusion, by thoracic epidural infusion, by injection for nerve block, and by infiltration.<sup>1(4/06)</sup>

## Stability

Intact containers of ropivacaine hydrochloride should be stored at controlled room temperature. The single-dose containers have no antimicrobial preservatives. The manufacturer recommends that any remaining solution in an opened container be discarded promptly. The continuous infusion bottles should not be left in place for more than 24 hours.<sup>1(4/06)</sup>

## Autoclaving

Ropivacaine hydrochloride in glass containers is stable during one autoclaving to sterilize the container.<sup>1(4/06)</sup>

## pH Effects

The solubility of ropivacaine hydrochloride is reduced above pH 6. Consequently, contact with alkaline solutions may result in precipitation.<sup>1(4/06)</sup>

## Salbutamol Sulfate

AHFS 12:12.08.12

### Products

Salbutamol sulfate injection is available as a solution in 1-mL ampuls.<sup>3598 3600</sup> Each mL contains 500 mcg of salbutamol as the sulfate, as well as sodium chloride, sodium hydroxide, and sulfuric acid in water for injection.<sup>3598 3600</sup>

Salbutamol sulfate also is available as a concentrate for injection in 5-mL ampuls for use in infusions following dilution.<sup>3599 3600</sup> Each mL contains 1 mg of salbutamol as the sulfate, as well as sodium chloride, sodium hydroxide, and sulfuric acid in water for injection.<sup>3599 3600</sup> This concentrate for injection must be diluted in a suitable infusion solution prior to administration.<sup>3599 3600</sup>

### pH

The pH of both the injection and the concentrate for injection (GlaxoSmithKline New Zealand) is adjusted to 3.5.<sup>3600</sup>

### Tonicity

Both salbutamol sulfate injection and concentrate for injection are isotonic.<sup>3598 3599 3600</sup>

### Trade Name(s)

Salbumol, Ventolin

### Administration

Salbutamol sulfate injection is administered by subcutaneous, intramuscular, or slow intravenous injection.<sup>3598 3600</sup> A 50-mcg/mL salbutamol concentration (e.g., 250 mcg diluted in 5 mL) is

suitably dilute for slow intravenous injection; the 500-mcg/mL concentration has been diluted with sterile water for injection to achieve the 50-mcg/mL concentration.<sup>3598 3600</sup>

Salbutamol sulfate concentrate for injection is used to prepare intravenous infusion solutions of the drug; it should *not* be administered undiluted.<sup>3599 3600</sup> The concentrate for injection should be diluted to a concentration of 10, 20, or 200 mcg/mL, depending upon the indication and infusion method (e.g., syringe pump), with a compatible infusion solution.<sup>3599 3600</sup> Recommended infusion solutions may vary based on the indication; consult specific labeling for details.<sup>3598 3599 3600</sup>

### Stability

Salbutamol sulfate injection and concentrate for injection are clear, colorless or pale straw-colored solutions.<sup>3598 3599 3600</sup> The intact containers should be stored below 30°C and protected from light (e.g., by storing in the outer container).<sup>3598 3599 3600</sup>

### Syringes

Salbutamol sulfate (GlaxoSmithKline) prepared at a salbutamol concentration of 3 mg/50 mL in sodium chloride 0.9% in a 50-mL polypropylene syringe (Becton Dickinson) was physically stable for 48 hours at room temperature.<sup>3545</sup>

Salbutamol sulfate (GlaxoSmithKline) prepared at a salbutamol concentration of 0.06 mg/mL in sodium chloride 0.9% in a 50-mL polypropylene syringe (Becton Dickinson) was physically and chemically stable for 30 days at 2 to 8°C protected from light.<sup>3601</sup>

## Sargramostim

AHFS 20:16

GM-CSF

### Products

Sargramostim is available in single-dose vials labeled as containing 250 mcg. Reconstitute the vial with 1 mL of sterile water for injection or bacteriostatic water for injection containing benzyl alcohol 0.9% directed at the sides of the vial. Gently swirl to avoid foaming during dissolution, and do not shake. Each mL of the reconstituted solution contains sargramostim 250 mcg, mannitol 40 mg, sucrose 10 mg, and tromethamine 1.2 mg.<sup>1(4/08)</sup> 4 The contents of vials reconstituted with different diluents should not be mixed.<sup>1(4/08)</sup>

Sargramostim is also available as a preserved liquid formulation in 1-mL vials containing in each mL sargramostim 500 mcg along with mannitol 40 mg, sucrose 10 mg, tromethamine 1.2 mg, and benzyl alcohol 1.1% as an antimicrobial preservative.<sup>1(4/08)</sup> 4

### Specific Activity

The specific activity is approximately  $5.6 \times 10^6$  units per milligram.<sup>1(4/08)</sup>

### pH

From 7.1 to 7.7.<sup>1(4/08)</sup> 17

### Trade Name(s)

Leukine

### Administration

Sargramostim may be administered by subcutaneous injection undiluted or by intravenous infusion usually over 2 to 4 hours after dilution in sodium chloride 0.9%.<sup>1(4/08)</sup> For infusion concentrations below 10 mcg/mL, albumin human at a final concentration of 0.1% should be added to the intravenous solution prior to the addition of sargramostim to prevent adsorption.<sup>1(4/08)</sup>

The preparations containing benzyl alcohol (Leukine liquid, and lyophilized Leukine reconstituted with bacteriostatic water

for injection containing benzyl alcohol) should not be used in neonates.<sup>1(4/08)</sup>

### Stability

Intact vials, reconstituted solutions, and sargramostim diluted in sodium chloride 0.9% should be stored under refrigeration. Solutions should be protected from freezing and should not be shaken. The liquid formulation is a clear, colorless solution. The white lyophilized powder forms a clear, colorless solution on reconstitution. The manufacturer recommends administration within 6 hours following reconstitution with sterile water for injection and/or dilution in an infusion solution and discarding any unused solution. When reconstituted with bacteriostatic water for injection preserved with benzyl alcohol 0.9%, the manufacturer states that the solution may be stored for up to 20 days under refrigeration.<sup>1(4/08)</sup>

Other information indicates that sargramostim reconstituted with sterile water for injection or bacteriostatic water for injection is stable for 30 days at 25°C or under refrigeration.<sup>226</sup>

### Syringes

Sargramostim 250 mcg and 500 mcg reconstituted with 1 mL of bacteriostatic water for injection with benzyl alcohol 0.9% and repackaged in 1-mL tuberculin syringes (Becton Dickinson) is stated to be stable for 14 days when stored under refrigeration.<sup>226</sup>

### Sorption

Sargramostim will adsorb to containers and tubing if the concentration is below 10 mcg/mL. Albumin human 0.1% should be added to the intravenous solution to prevent this.<sup>1(4/08)</sup>

### Filtration

Sargramostim should not be infused through an inline filter because of possible absorption.<sup>1(4/08)</sup> 4

## Scopolamine Butylbromide

AHFS 12:08.08

### Products

Scopolamine butylbromide 20 mg/mL with sodium chloride in water for injection is available in 1-mL ampuls.<sup>115</sup>

### Trade Name(s)

Buscopan, Scoburen

### Administration

Scopolamine butylbromide is administered by intramuscular or subcutaneous injection or slowly intravenously. Dextrose

5% and sodium chloride 0.9% are recommended for dilution if needed.<sup>115</sup>

### Stability

Scopolamine butylbromide injection is a clear, colorless or nearly colorless solution. Intact containers should be stored below 30°C and protected from light.<sup>115</sup>

# Scopolamine Hydrobromide

AHFS 12:08.08

## Hyoscine Hydrobromide

### Products

Scopolamine hydrobromide is available in 1-mL multiple-dose vials containing 0.4- and 1-mg/mL concentrations. Also present in the products are methylparaben 0.18% and propylparaben 0.02%. Hydrobromic acid may have been used to adjust the pH.<sup>1(6/06) 4</sup>

### pH

From 3.5 to 6.5.<sup>1(6/06) 4</sup>

### Osmolality

The osmolality of scopolamine hydrobromide 0.5 mg/mL was determined to be 303 mOsm/kg.<sup>1233</sup>

### Administration

Scopolamine hydrobromide may be administered subcutaneously, intramuscularly, or intravenously by direct intravenous injection after dilution with sterile water for injection.<sup>1(6/06) 4</sup>

### Stability

The product should be stored at controlled room temperature and protected from light.<sup>1(6/06)</sup> Scopolamine hydrobromide is stated to be incompatible with alkalis.<sup>4</sup> Scopolamine hydrobromide decomposition is primarily due to hydrolysis below pH 3 and to both hydrolysis and inversion about the chiral carbon above pH 3. The minimum rate of decomposition occurs at pH 3.5.<sup>1072</sup>

## Sodium Acetate

AHFS 40:08

### Products

Sodium acetate is available as a 16.4% solution in 20-, 50-, 100-, and 250-mL vials. Each mL of solution contains 2 mEq of sodium acetate in water for injection. Sodium acetate is also available as a 32.8% solution in 50- and 100-mL vials. Each mL of solution contains 4 mEq of sodium acetate in water for injection. The pH may have been adjusted with acetic acid.<sup>1(9/06)</sup>

### pH

From 6 to 7.<sup>1(9/06)</sup> 17

### Osmolarity

Sodium acetate injection is very hypertonic and must be diluted for use. The 2-mEq/mL concentration has a calculated

osmolarity of 4 mOsm/mL, and the 4-mEq/mL concentration has a calculated osmolarity of 8 mOsm/mL.<sup>1(9/06)</sup>

### Administration

Sodium acetate is administered by slow intravenous infusion after addition to a larger volume of fluid. It must not be given undiluted.<sup>1(9/06)</sup>

### Stability

The product should be stored at controlled room temperature and protected from freezing and excessive heat. Discarding the vials four hours after initial entry has been recommended.<sup>1(9/06)</sup>

# Sodium Bicarbonate

## AHFS 40:08

### Products

Sodium bicarbonate injection is available from various manufacturers in vials and syringes as an aqueous solution in concentrations of 4.2, 7.5, and 8.4%.<sup>3223 3224</sup> Carbon dioxide may have been added to some products to adjust the pH.<sup>3224</sup>

Concentration	Bicarbonate (and Sodium) Concentration	Total Container Content	Osmolarity
8.4%	1 mEq/mL	10 mEq/10 mL	2000 mOsm/L
8.4%	1 mEq/mL	50 mEq/50 mL	2000 mOsm/L
7.5%	0.892 mEq/mL	44.6 mEq/50 mL	1790 mOsm/L
4.2%	0.5 mEq/mL	5 mEq/10 mL	1000 mOsm/L

Sodium bicarbonate 4% neutralizing additive solution (Neut, Hospira) is available in 5-mL single-dose vials.<sup>3225</sup> Each mL of solution provides 0.48 mEq of bicarbonate and sodium and 2 mg of edetate disodium anhydrous.<sup>3225</sup> Sodium bicarbonate neutralizing additive solution is used to raise the pH of acidic solutions.<sup>3225</sup>

### Equivalency

Each 84 mg of sodium bicarbonate provides 1 mEq of sodium and bicarbonate ions.<sup>3223 3224</sup>

### pH

From 7 to 8.5.<sup>3223 3224 3225</sup>

### Administration

Sodium bicarbonate is administered intravenously, either undiluted or diluted in other fluids.<sup>3223 3224 3225</sup> It also has been administered subcutaneously if diluted to isotonicity (1.5%).<sup>2043</sup>

### Stability

Sodium bicarbonate injection should be stored at controlled room temperature.<sup>3223 3224 3225</sup> A solution that is unclear or that contains a precipitate should not be used.<sup>3223 3224</sup>

Sodium bicarbonate injection under simulated summer conditions in paramedic vehicles was exposed to temperatures ranging from 26 to 38°C over 4 weeks. Analysis found no loss of the drug under these conditions.<sup>2562</sup>

Combining sodium bicarbonate with acids in aqueous solutions results in the liberation of carbon dioxide gas.<sup>2248</sup> The bubbles can evolve to a sufficient quantity to cause effervescence.<sup>2248</sup>

The stability of sodium bicarbonate 7.5% in polypropylene syringes is inversely related to the storage temperature.<sup>136</sup> Estimates of room temperature stability range from 1 week<sup>137</sup> to 1 month.<sup>136</sup> Refrigeration may increase the stability to 60<sup>137</sup> to 90 days.<sup>136</sup> Stability also may be increased by refrigerating the sodium bicarbonate injection and the syringes before preparation, rinsing the syringes twice with refrigerated sterile water for injection, minimizing the contact of the solution with the air by expelling the air from the syringes, and taping the plunger in place to minimize its movement from escaping carbon dioxide.<sup>137</sup>

### pH Effects

Drugs such as sodium bicarbonate that may raise the pH of an admixture above 6 may cause significant decomposition of alkali-labile drugs.<sup>59 77 79</sup>

The change in pH that occurs when 5 mL of sodium bicarbonate 4% additive solution (Neut, Abbott) is added to a liter of 5 common infusion solutions (Travenol) was reported:<sup>1129</sup>

Solution	Initial pH	pH after Neut Added	pH Increase
Dextrose 5%	4.4	7.5	3.1
Dextrose 10%	3.9	7.1	3.2
Ringer's injection	5.6	7.5	1.9
Sodium chloride 0.45%	5.6	7.8	2.2
Sodium chloride 0.9%	5.5	7.6	2.2

<sup>a</sup> One vial of Neut added to a liter of admixture.

<sup>b</sup> Tested in PVC containers.

<sup>c</sup> Tested in glass containers.

<sup>d</sup> Tested in polyolefin containers.

<sup>e</sup> Two vials of Neut added to a liter of admixture.

<sup>f</sup> A buffered preparation was specified.

<sup>g</sup> Incompatible by conventional standards but may be used in shorter periods of time.

<sup>h</sup> Tested in an extemporaneously-compounded hemofiltration solution.

<sup>i</sup> Final sodium bicarbonate concentration not specified.

<sup>j</sup> Imipenem component. Imipenem in a 1:1 fixed-ratio concentration with cilastatin.

**Additional Compatibility Information****Methylprednisolone**

The compatibility of methylprednisolone sodium succinate (Upjohn) with sodium bicarbonate added to an auxiliary medication infusion unit has been studied. Primary admixtures

were prepared by adding sodium bicarbonate 44.6 mEq/L to dextrose 5%, dextrose 5% in sodium chloride 0.9%, and Ringer's injection, lactated. Up to 100 mL of the primary admixture was added along with methylprednisolone sodium succinate (Upjohn) to the auxiliary medication infusion unit with the following results:<sup>329</sup>

Methylprednisolone Sodium Succinate	Sodium Bicarbonate 44.6 mEq/L Primary Solution	Results
500 mg	D5S, D5W qs 100 mL	Clear solution for 24 hr
500 mg	LR qs 100 mL or added to 100 mL LR	Clear solution for 1 hr
1000 mg	D5W qs 100 mL	Clear solution for 24 hr
1000 mg	D5S qs 100 mL or added to 100 mL D5S	Clear solution for 24 hr

## Sodium Chloride

### AHFS 40:12

#### Products

Sodium chloride additive solution is available in various size containers in concentrations of 14.6 and 23.4%. The 14.6% concentration contains sodium chloride 146 mg/mL and provides 2.5 mEq/mL of sodium and chloride ions. The 23.4% concentration contains sodium chloride 234 mg/mL and provides 4 mEq/mL of sodium and chloride ions.<sup>1(2/06)</sup>

NOTE: Do not confuse these high concentration additive solutions with other sodium chloride products with lower concentrations.

Sodium chloride 0.45 and 0.9% infusion solutions are available in a variety of sizes from 25 to 1000 mL. The 0.45 and 0.9% concentrations provide 77 and 154 mEq of sodium and chloride per liter, respectively.<sup>1(2/06)</sup> 4

#### pH

From 4.5 to 7.<sup>17</sup>

#### Osmolarity

Sodium chloride additive solutions are very hypertonic and must be diluted for use. The osmolarities of the 14.6 and 23.4% concentrations have been calculated to be about 5000 and 8000 mOsm/L, respectively.<sup>4</sup> The osmolality of the 14.6% concentration was determined to be 5370 mOsm/kg by freezing-point

depression and 4783 mOsm/kg by vapor pressure.<sup>1071</sup> A 0.9% sodium chloride solution is isotonic, having an osmolarity of 308 mOsm/L. A 0.45% sodium chloride solution is hypotonic, having a calculated osmolarity of 154 mOsm/L.<sup>4</sup>

#### Administration

Sodium chloride additive solutions of 14.6 and 23.4% are administered by intravenous infusion only after dilution in a larger volume of fluid.<sup>4</sup> Dextrose 5% has been recommended for this dilution.<sup>1(2/06)</sup> When concentrations of 3 or 5% are indicated, these hypertonic solutions should be administered into a large vein, at a rate not exceeding 100 mL/hr. Infiltration should be avoided.<sup>4</sup>

#### Stability

Sodium chloride additive solution should be stored at controlled room temperature and protected from excessive heat and freezing.<sup>1(2/06)</sup>

#### Elastomeric Reservoir Pumps

Sodium chloride 0.9% (Baxter) 250 mL was filled into Intermate LV 250 (Baxter) elastomeric infusion devices and stored at 5 and 23°C for 90 days. The solution remained visually compatible with no change in pH and sodium or chloride concentration and less than 0.1% water loss.<sup>1993</sup>

## Sodium Ferric Gluconate Complex

AHFS 20:04.04

### Products

Sodium ferric gluconate complex is available as a deep red solution in single-use 5-mL vials containing 62.5 mg of elemental iron as the sodium salt of a ferric ion carbohydrate complex.<sup>3007</sup> Each mL of solution also contains sucrose 195 mg (approximately 20% w/v) and benzyl alcohol 9 mg in water for injection.<sup>3007</sup>

### pH

From 7.7 to 9.7.<sup>3007</sup>

### Trade Name(s)

Ferrlecit

### Administration

Sodium ferric gluconate complex is administered as an intravenous infusion over 1 hour after dilution of the dose in 100 or 25 mL of sodium chloride 0.9% for adult or pediatric patients, respectively.<sup>3007</sup> In adult patients, the drug also may be administered undiluted by slow intravenous injection at a rate no faster than 12.5 mg/min.<sup>3007</sup>

### Stability

Intact vials of sodium ferric gluconate complex should be stored at controlled room temperature.<sup>3007</sup> Freezing should be avoided.<sup>3007</sup>

Diluted solutions of sodium ferric gluconate complex should be visually inspected for particulate matter and discoloration prior to use.<sup>3007</sup> Diluted solutions of sodium ferric gluconate complex should be used immediately.<sup>3007</sup>

In one study, sodium ferric gluconate complex was diluted in 100 mL of sodium chloride 0.9% to concentrations of 0.625 and 1.25 mg/mL of elemental iron.<sup>3008</sup> Spectrophotometric evaluation showed that the elemental iron concentration in the solutions was stable for at least 1 day at room temperature and at least 7 days at 2 to 8°C.<sup>3008</sup> Additionally, no substantial changes in the apparent molecular weight of sodium ferric gluconate complex were noted to have occurred during these time periods.<sup>3008</sup>

### Syringes

Undiluted sodium ferric gluconate complex containing 12.5 mg/mL of elemental iron was packaged as 10 mL in 10-mL syringes with capped needles.<sup>3008</sup> Spectrophotometric evaluation showed that the elemental iron concentration was stable for at least 1 day at room temperature and at least 3 days at 2 to 8°C.<sup>3008</sup> Additionally, no substantial changes in the apparent molecular weight of sodium ferric gluconate complex were noted to have occurred during these time periods.<sup>3008</sup>

## Sodium Lactate

### AHFS 40:08

### Products

Sodium lactate additive solution is available in 10-mL vials. Each mL of solution contains 5 mEq of sodium lactate. The 10-mL vial contains a total of 50 mEq each of Na<sup>+</sup> and lactate ion (5.6 g of sodium lactate). The pH is adjusted with hydrochloric acid, lactic acid, or sodium hydroxide if necessary.<sup>1(10/06) 4</sup>

Sodium lactate ½ M (1.9%) infusion solution is available in 500- and 1000-mL containers. It provides 167 mEq of sodium and lactate per liter.<sup>4</sup>

### pH

From 6 to 7.3.<sup>1(10/06) 17</sup>

### Osmolality

Sodium lactate additive solution is very hypertonic and must be diluted for use. The osmolality was calculated to be about 10,000 mOsm/L.<sup>1(10/06)</sup> The osmolality was determined to be 11,490 mOsm/kg by freezing-point depression and 10,665 mOsm/kg by vapor pressure.<sup>1071</sup>

Sodium lactate ½ M (1.9%) is approximately isotonic with a calculated osmolality of 330 mOsm/L.<sup>4</sup>

### Administration

Sodium lactate additive solution is administered by intravenous infusion only after dilution in a larger volume of fluid. A ½ M (1.9%) solution may be prepared by diluting 50 mEq of the additive solution to 300 mL with a nonelectrolyte solution or sterile water for injection. Sodium lactate ½ M infusion solution does not require dilution prior to use. The rate of infusion should not exceed 300 mL/hr in adults.<sup>1(10/06) 4</sup>

### Stability

Sodium lactate additive solution should be stored at controlled room temperature and protected from freezing and excessive temperatures of 40°C or more.<sup>1(10/06) 4</sup>

# Sodium Nitroprusside

AHFS 24:08.20

## Products

Sodium nitroprusside is available in 2-mL single-dose amber vials as a concentrate for injection with each mL containing the equivalent of 25 mg of sodium nitroprusside dihydrate in sterile water for injection.<sup>3282</sup> The concentrate for injection must be further diluted in 250 to 1000 mL of dextrose 5% prior to administration.<sup>3282</sup> The diluted solution for infusion should be protected from light using the provided opaque sleeve, aluminum foil, or another opaque material.<sup>3282</sup> The manufacturers state that covering the infusion drip chamber and tubing is not necessary.<sup>3282</sup>

Sodium nitroprusside also is available as a ready-to-use solution in 100-mL single-use (unpreserved) amber vials containing sodium nitroprusside 50 mg in 100 mL of sodium chloride 0.9%.<sup>3283</sup> The ready-to-use solution in the amber vial should be stored in the carton until use to protect from light<sup>3283</sup> but does not require light protection during administration.<sup>3290</sup>

## pH

The pH of a 1-mg/mL solution in dextrose 5% was reported to be 4.2 (Roche)<sup>1579</sup> or 4.74 to 4.94 (Valeant).<sup>3284</sup>

## Sodium Content

Contains sodium 0.335 mEq/50 mg of drug.<sup>846</sup>

## Trade Name(s)

Nipride RTU, Nitropress

## Administration

Sodium nitroprusside is administered only as an intravenous infusion as the ready-to-use solution<sup>3283</sup> or after proper dilution of the concentrate for injection in 250 to 1000 mL of dextrose 5%.<sup>3282</sup> The concentrate for injection is not suitable for direct injection.<sup>3282</sup> A volumetric infusion pump must be used to administer sodium nitroprusside;<sup>3283</sup> the solution for infusion should not be infused through an ordinary intravenous apparatus regulated only by gravity and mechanical clamps.<sup>3282</sup>

Infusion of sodium nitroprusside should be initiated at a rate of 0.3 mcg/kg/min with an upward titration every few minutes until the desired effect is achieved or the maximum recommended infusion rate of 10 mcg/kg/min has been reached.<sup>3282</sup><sup>3283</sup> Manufacturers state that infusion at the maximum rate of 10 mcg/kg/min should be limited to less than 10 minutes.<sup>3282</sup><sup>3283</sup> The maximum recommended infusion rate for patients with severe renal impairment and anuric patients is less than 3 mcg/kg/min and 1 mcg/kg/min, respectively.<sup>3282</sup><sup>3283</sup>

## Stability

Sodium nitroprusside is colorless to reddish-brown<sup>3283</sup> or faint brownish in color.<sup>3282</sup> Intact vials should be stored at controlled room temperature and retained in the original carton until use to protect from light.<sup>3282</sup><sup>3283</sup>

Sodium nitroprusside protected from light has been reported to be stable for 12 to 24 hours,<sup>93</sup> 460<sup>1296</sup> 1579<sup>3282</sup> to 48 hours,<sup>958</sup> to 13 days,<sup>95</sup> or even longer.<sup>94</sup> 458 459 732

Sodium nitroprusside solutions for infusion should be inspected for particulate matter and discoloration prior to administration; any solution that is discolored or in which particulate matter is visible should not be used.<sup>3282</sup><sup>3283</sup> Sodium nitroprusside may be inactivated and/or rapidly degraded by reactions with trace contaminants, forming highly colored reaction products (usually blue, green, or bright red).<sup>3282</sup><sup>3283</sup> Such solutions should not be used.<sup>3282</sup><sup>3283</sup> It is, therefore, recommended that no other drug be added to sodium nitroprusside solutions.<sup>3282</sup><sup>3283</sup>

Dextrose 5% is the recommended infusion solution for admixture of the concentrate for injection<sup>90</sup><sup>91</sup><sup>3282</sup> although it turns blue more rapidly than the drug in saline solution.<sup>732</sup>

Sodium nitroprusside 1 mg/mL in 6 solutions in PVC bags was evaluated for production of cyanide, produced by sodium nitroprusside degradation from exposure to 300 foot-candles of light for 72 hours. The solutions tested included 3 nonelectrolyte solutions (dextrose 5%; dextrose 10%; distilled water) and 3 electrolyte solutions (sodium chloride 0.9%; Ringer's injection, lactated; dextrose 5% in Ringer's injection, lactated). There was no difference in the amount of cyanide produced among the solutions throughout the first 24 hours. However, the electrolyte solutions exhibited statistically significant lower mean cyanide ion concentrations (about 2 to 5 ppm) than the nonelectrolyte solutions (about 7 to 9 ppm). These levels of cyanide are an order of magnitude greater than in light-protected solutions. It was concluded that electrolyte solutions may be preferable to dextrose 5% for sodium nitroprusside administration and that all doses should be prepared as freshly as possible and protected from light.<sup>2023</sup>

## Temperature Effects

Sodium nitroprusside solutions are heat sensitive. Autoclaving a solution of 100 mg/250 mL in dextrose 5% at 115°C for 30 minutes results in decomposition to a pale blue-green precipitate.<sup>458</sup> It has been stated that autoclaving is less deleterious than even moderate exposure to light.<sup>94</sup>

## Light Effects

Solutions of sodium nitroprusside exhibit a color variously described as faint brownish,<sup>3282</sup> brown,<sup>90</sup> red-brown,<sup>3283</sup> brownish-pink,<sup>91</sup> light orange,<sup>95</sup> and straw.<sup>92</sup> These solutions are highly sensitive to light.<sup>3282</sup> Exposure to light causes decomposition, resulting in a highly colored solution of light yellow,<sup>1579</sup> orange,<sup>92</sup> dark brown,<sup>91</sup> or blue.<sup>90</sup><sup>91</sup><sup>92</sup> A blue color indicates almost complete degradation.<sup>92</sup>

The rate of decomposition of sodium nitroprusside when exposed to light is dependent on such factors as the wavelength and intensity of light, temperature, infusion fluid, pH, and container material. The amount of loss occurring in the

administration tubing can be affected additionally by the nature and thickness of the tubing wall, duration of light exposure, volume of fluid, and flow rate.<sup>1297</sup>

In one study, sodium nitroprusside 0.01% in both water and dextrose 5% in glass bottles exhibited 9 to 10% decomposition in 2 hours and 18 to 20% decomposition in 4 hours on exposure to fluorescent light. No decomposition was detected in either solution in 24 hours when protected from light. In PVC bags, even greater decomposition occurred on exposure to light.<sup>460</sup>

In another study, 10-mg/mL aqueous solutions of sodium nitroprusside lost 3% in 24 hours on exposure to fluorescent light and 10% in 24 hours when exposed to both fluorescent light and indirect daylight. At a concentration of 200 mg/L in infusion solutions, exposure to bright daylight increased the loss to approximately 15 to 30% in 5 hours. The rate of breakdown was related to the amount of illumination. When the containers were protected from light by wrapping with foil, no decomposition was observed in infusion solutions for 7 days at room temperature and for 2 years at 10 mg/mL in glass tubes at room temperature or 4°C.<sup>732</sup>

The rate of decomposition of sodium nitroprusside (David Bull Laboratories) 1 mg/mL in dextrose 5% was studied when exposed to fluorescent light and natural daylight. The solutions were stored at 23°C in the burette chambers of an amber light-protective set, a clear colorless set, and a clear set covered with a foil overwrap. With exposure to fluorescent light, losses in the clear burette chamber totaled 11% in 150 minutes and 100% in 24 hours. Both the amber and foil-wrapped clear sets sustained virtually no loss in 4 hours and about a 3 to 4% loss in 24 hours. Natural daylight caused a more rapid drug loss in the unprotected burette; essentially all drug was lost in 30 to 150 minutes, depending on the daylight intensity. The amber set slowed the degradation rate, but 32% was still lost in 2 hours with exposure to intense direct sunlight.<sup>1296</sup>

Solutions of sodium nitroprusside prepared from the concentrate for injection should be protected from light by wrapping the container with the provided opaque sleeve, aluminum foil, or another opaque material.<sup>90 91 1297 3282</sup> The container should be wrapped as soon as practical without delaying therapy.<sup>959</sup> Amber plastic bags, which are often used for light protection, have been stated not to provide sufficient protection for sodium nitroprusside against photodegradation. Only opaque materials should be used.<sup>733</sup>

The effect of the light exposure that sodium nitroprusside infusions receive while flowing through a 3-m long PVC infusion set tubing was evaluated. Sodium nitroprusside infusions

in dextrose 5%, sodium chloride 0.9%, and Ringer's injection, lactated, were studied for 24 and 8 hours at flow rates of 10 and 50 mL/hr, respectively. The delivered amount of sodium nitroprusside was not reduced.<sup>958</sup>

The stability of sodium nitroprusside (Roche) 100 mcg/mL in dextrose 5% was studied when delivered through tubing exposed to normal room light. No degradation occurred in the infusion container wrapped in foil, but concentration differences in the delivered solution of about 2% were noted at each time point sampled over the 5-hour study. When the effects of different light sources on a 50-mcg/mL solution in dextrose 5% were compared, about a 7% loss occurred on exposure to fluorescent light for 6 hours, but a 32% loss occurred in 1 hour on exposure to direct sunlight.<sup>1131</sup>

The stability of sodium nitroprusside (Roche) 0.5 and 1.67 mg/mL in dextrose 5% administered by a syringe pump system was evaluated. In polypropylene syringes (Sherwood Medical) exposed to both artificial light and daylight, sodium nitroprusside losses after 24 hours were 26 and 18.7% at 0.5 and 1.67 mg/mL, respectively. The level of free cyanide exceeded 2 mcg/mL. The time to 10% decomposition was about 4 hours. Syringes wrapped in foil exhibited less than a 5% loss in 24 hours. A comparison of the decomposition occurring in the delivery tubing showed that about 10.3 and 3.7% were lost from the 0.5- and 1.67-mg/mL concentrations, respectively, when delivered by pumps at 3 mL/hr through tubing exposed to the light. Wrapping the line with foil prevented any decomposition over the 24-hour study.<sup>1130</sup>

Sodium nitroprusside (Roche) 50 mg/50 mL in dextrose 5% exhibited no change in appearance and no loss when stored for 24 hours at 25°C in 60-mL plastic syringes (Becton Dickinson) wrapped in foil;<sup>1579</sup> however, if the syringes were not wrapped in foil for light protection, the solution turned yellow in 12 hours and had approximately 11, 17, and 22% losses in 6, 12, and 24 hours, respectively.<sup>1579</sup>

### Syringes

Sodium nitroprusside (Valeant) 1 mg/mL in dextrose 5% packaged as 6.25 mL in 20-mL polypropylene syringes (Becton Dickinson) and wrapped in aluminum foil was physically and chemically stable for 9 days when stored at 4°C.<sup>3284</sup>

### Sorption

Sodium nitroprusside was shown not to exhibit sorption to PVC bags and tubing, polyethylene tubing, Silastic tubing, and polypropylene syringes.<sup>536 606 1131</sup>

## Compatibility Information

### Solution Compatibility

#### Sodium nitroprusside

Test Soln Name	Mfr	Mfr	Conc/L or %	Remarks	Ref	C/I
Dextrose 5%			100 mg	No decomposition in 24 hr protected from light	460	C
Dextrose 5%			100 mg	9 to 10% decomposition in 2 hr exposed to light	460	I

*Solution Compatibility (Cont.)*

Test Soln Name	Mfr	Mfr	Conc/L or %	Remarks	Ref	C/I
Dextrose 5%	TR		200 mg	No decomposition in 7 days at room temperature in foil-wrapped bottles	732	C
Dextrose 5%	TR		200 mg	14 to 16% decomposition in 5 hr exposed to bright daylight	732	I
Dextrose 5%	TR <sup>a</sup>		88 mg	18% loss in 24 hr when bag was exposed to both daylight and fluorescent light	732	I

## Sodium Phosphates

### AHFS 40:12

#### Products

Sodium phosphates additive solution is available in 5-, 15-, and 50-mL vials.<sup>1(6/06)</sup> Each mL contains monobasic sodium phosphate monohydrate 276 mg and dibasic sodium phosphate anhydrous 142 mg.<sup>3301</sup> The phosphorus concentration is 3 mmol/mL (93 mg/mL), and the sodium content is 4 mEq/mL (92 mg/mL).<sup>3301</sup> Aluminum also is present.<sup>3301</sup> The additive solution is a concentrate and must be diluted for use.<sup>3301</sup>

#### pH

From 5 to 6.<sup>3301</sup>

#### Osmolarity

The osmolar concentration of sodium phosphates additive solution is calculated to be 7 mOsm/mL.<sup>3301</sup>

#### Administration

Sodium phosphates additive solution must be diluted and thoroughly mixed in a larger volume of fluid before use.<sup>3301</sup>

#### Stability

Sodium phosphates additive solution should be stored at controlled room temperature.<sup>3301</sup> The solution should be inspected for discoloration or particulate matter prior to use and should be used only if it is clear.<sup>3301</sup> The injection contains no antimicrobial agent or bacteriostat.<sup>3301</sup> Any unused portions should be discarded.<sup>3301</sup>

## Additional Compatibility Information

### Calcium and Phosphate

Phosphates may be incompatible with metal ions such as magnesium and calcium. A number of studies using potassium phosphate have been performed. For additional information, refer to the potassium phosphate monograph.

#### UNRECOGNIZED CALCIUM PHOSPHATE PRECIPITATION IN A 3-IN-1 PARENTERAL NUTRITION MIXTURE RESULTED IN PATIENT DEATH.

The potential for the formation of a calcium phosphate precipitate in parenteral nutrition solutions is well studied and documented,<sup>1771 1777</sup> but the information is complex and difficult to apply to the clinical situation.<sup>1770 1772 1777</sup> The incorporation of fat emulsion in 3-in-1 parenteral nutrition solutions obscures any precipitate that is present, which has led to substantial debate on the dangers associated with 3-in-1 parenteral nutrition mixtures and when or if the danger to the patient is warranted therapeutically.<sup>1770 1771 1772 2031 2032 2033 2034 2035 2036</sup> Because such precipitation may be life-threatening to patients,<sup>2037 2291</sup> FDA issued a Safety Alert containing the following recommendations:<sup>1769</sup>

1. "The amounts of phosphorus and of calcium added to the admixture are critical. The solubility of the added calcium should be calculated from the volume at the time the calcium is added. It should not be based upon the final volume.

Some amino acid injections for TPN admixtures contain phosphate ions (as a phosphoric acid buffer). These phosphate ions and the volume at the time the phosphate is added should be considered when calculating the concentration of phosphate additives. Also, when adding calcium and phosphate to an admixture, the phosphate should be added first.

The line should be flushed between the addition of any potentially incompatible components.

2. A lipid emulsion in a 3-in-1 admixture obscures the presence of a precipitate. Therefore, if a lipid emulsion is needed, either (1) use a 2-in-1 admixture with the lipid infused separately, or (2) if a 3-in-1 admixture is medically necessary, then add the calcium before the lipid emulsion and according to the recommendations in number 1 above.

If the amount of calcium or phosphate which must be added is likely to cause a precipitate, some or all of the calcium should be administered separately. Such separate infusions must be properly diluted and slowly infused to avoid serious adverse events related to the calcium.

3. When using an automated compounding device, the above steps should be considered when programming the device. In addition, automated compounders should be maintained and operated according to the manufacturer's recommendations.

Any printout should be checked against the programmed admixture and weight of components.

4. During the mixing process, pharmacists who mix parenteral nutrition admixtures should periodically agitate the admixture and check for precipitates. Medical or home care personnel who start and monitor these infusions should carefully inspect for the presence of precipitates both before and during infusion. Patients and care givers should be trained to visually inspect for signs of precipitation. They also should be advised to stop the infusion and seek medical assistance if precipitates are noted.

5. A filter should be used when infusing either central or peripheral parenteral nutrition admixtures. At this time, data have not been submitted to document which size filter is most effective in trapping precipitates.

Standards of practice vary, but the following is suggested: a 1.2- $\mu$ m air-eliminating filter for lipid-containing admixtures and a 0.22- $\mu$ m air-eliminating filter for non-lipid-containing admixtures.

6. Parenteral nutrition admixtures should be administered within the following time frames: if stored at room temperature, the infusion should be started within 24 hours after mixing; if stored at refrigerated temperatures, the infusion should be started within 24 hours of rewarming. Because warming parenteral nutrition admixtures may contribute to the formation of precipitates, once administration begins, care should be taken to avoid excessive warming of the admixture.

Persons administering home care parenteral nutrition admixtures may need to deviate from these time frames. Pharmacists who initially prepare these admixtures should check a reserve sample for precipitates over the duration and under the conditions of storage.

7. If symptoms of acute respiratory distress, pulmonary emboli, or interstitial pneumonitis develop, the infusion should be stopped immediately and thoroughly checked for precipitates. Appropriate medical interventions should be instituted. Home care personnel and patients should immediately seek medical assistance.<sup>11769</sup>

### Calcium Phosphate Precipitation Fatalities

Fatal cases of paroxysmal respiratory failure in 2 previously healthy women receiving peripheral vein parenteral nutrition were reported. The patients experienced sudden cardiopulmonary arrest consistent with pulmonary emboli. The authors used in vitro simulations and an animal model to conclude that unrecognized calcium phosphate precipitation in a 3-in-1 total nutrition admixture caused the fatalities. The precipitation resulted during compounding by introducing calcium and phosphate near to one another in the compounding sequence and prior to complete fluid addition. This resulted in a temporarily high concentration of the drugs and precipitation of calcium phosphate. Observation of the precipitate was obscured by the incorporation of 20% fat emulsion, intravenous, into the nutrition mixture. No filter was used during infusion of the fatal nutrition admixtures.<sup>2037</sup>

In a follow-up retrospective review, 5 patients were identified who had respiratory distress associated with the infusion of the 3-in-1 admixtures at around the same time. Four of these 5 patients died, although the cause of death could be definitively determined for only 2.<sup>2291</sup>

### Calcium and Phosphate Conditional Compatibility

Calcium salts are conditionally compatible with phosphates in parenteral nutrition solutions. The incompatibility is dependent on a solubility and concentration phenomenon and is not entirely predictable. Precipitation may occur during compounding or at some time after compounding is completed.

NOTE: Some amino acid solutions inherently contain calcium and phosphate, which must be considered in any projection of compatibility.

A study determined the maximum concentrations of calcium (as chloride and gluconate) and phosphate that can be maintained without precipitation in a parenteral nutrition solution consisting of FreAmine II 4.25% and dextrose 25% for 24 hours at 30°C. It was noted that the amino acids in parenteral nutrition solutions form soluble complexes with calcium and phosphate,

reducing the available free calcium and phosphate that can form insoluble precipitates. The concentration of calcium available for precipitation is greater with the chloride salt compared to the gluconate salt, at least in part because of differences in dissociation characteristics. Consequently, a greater concentration of calcium gluconate than calcium chloride can be mixed with sodium phosphate.<sup>608</sup>

In addition to the concentrations of phosphate and calcium and the salt form of the calcium, the concentration of amino acids and the time and temperature of storage altered the formation of calcium phosphate in parenteral nutrition solutions. As the temperature was increased, the incidence of precipitate formation also increased. This finding was attributed, at least in part, to a greater degree of dissociation of the calcium and phosphate complexes and the decreased solubility of calcium phosphate. Therefore, a solution possibly may be stored at 4°C with no precipitation, but on warming to room temperature a precipitate will form over time.<sup>608</sup>

The solubility characteristics of calcium and phosphate in pediatric parenteral nutrition solutions composed of Aminosyn 0.5, 2, and 4% with dextrose 10 to 25% were reported. Also present were electrolytes and vitamins. Sodium phosphate was added sequentially in phosphorus concentrations from 10 to 30 mmol/L. Calcium gluconate was added last in amounts ranging from 1 to 10 g/L. The solutions were stored at 25°C for 30 hours and examined visually and microscopically for precipitation. The authors found that higher concentrations of Aminosyn increased the solubility of calcium and phosphate. Precipitation occurred at lower calcium and phosphate concentrations in the 0.5% solution compared to the 2 and 4% solutions. For example, at a phosphorus concentration of 30 mmol/L, precipitation occurred at calcium gluconate concentrations of about 1, 2, and 4 g/L in the 0.5, 2, and 4% Aminosyn mixtures, respectively. Similarly, at a calcium gluconate concentration of 8 g/L and above, precipitation occurred at phosphorus concentrations of about 13, 17, and 22 mmol/L in the 0.5, 2, and 4% solutions, respectively. The dextrose concentration did not appear to affect the calcium and phosphate solubility significantly.<sup>1042</sup>

The maximum allowable concentrations of calcium and phosphate in a 3-in-1 parenteral nutrition mixture for children (TNA #192 in Appendix) were reported. Added calcium was varied from 1.5 to 150 mmol/L, and added phosphate was varied from 21 to 300 mmol/L. These mixtures were stable for 48 hours at 22 and 37°C as long as the pH was not greater than 5.7, the calcium concentration was below 16 mmol/L, the phosphate concentration was below 52 mmol/L, and the product of the calcium and phosphate concentrations was below 250 mmol<sup>2</sup>/L<sup>2</sup> (mmol squared per liter squared).<sup>1773</sup>

Additional calcium and phosphate solubility curves were reported for specialty parenteral nutrition solutions based on NephAmine and also HepatAmine at concentrations of 0.8, 1.5, and 2% as the sources of amino acids. The solutions also contained dextrose 10%, with cysteine and pH adjustment to simulate addition of fat emulsion used in some admixtures. Calcium and phosphate solubility followed the hyperbolic patterns previously reported.<sup>609</sup> Temperature, time, and pH affected calcium and phosphate solubility, with pH having the greatest effect.<sup>2038</sup>

The maximum sodium phosphate concentrations were reported for given amounts of calcium gluconate that could be admixed in parenteral nutrition solutions containing TrophAmine in varying quantities (with cysteine hydrochloride 40 mg/g of amino acid) and dextrose 10%. The solutions also contained magnesium sulfate 4 mEq/L, potassium acetate 24 mEq/L, sodium chloride 32 mEq/L, pediatric multivitamins, and trace elements. The presence of cysteine hydrochloride reduces the solution pH and increases the amount of calcium and phosphate that can be incorporated before precipitation occurs. The results of this study cannot be safely extrapolated to TPN solutions with compositions other than the ones tested. The admixtures were compounded with the sodium phosphate added last after thorough mixing of all other components. The authors noted that this is not the preferred order of mixing (usually phosphate is added first and thoroughly mixed before adding calcium last); however, they believed this reversed order of mixing would provide a margin of error in cases in which the proper order is not followed. After compounding, the solutions were stored for 24 hours at 40°C. The maximum calcium and phosphate amounts that could be mixed in the various solutions were reported tabularly and are shown in Table 1.<sup>2039</sup> However, these results are not entirely consistent with another study.<sup>2196</sup>

**Table 1. Maximum amount of phosphate (as sodium) (mmol/L) not resulting in precipitation.<sup>2039</sup> See CAUTION below.<sup>a</sup>**

Calcium (as Gluconate)	Amino Acid (as TrophAmine) plus Cysteine HCl 40 mg/g of Amino Acid				
	0%	0.4%	1%	2%	3%
9.8 mEq/L	0	27	42	60	66
14.7 mEq/L	0	15	18	30	36
19.6 mEq/L	0	6	15	27	30
29.4 mEq/L	0	3	6	21	24

<sup>a</sup> CAUTION: The results cannot be safely extrapolated to solutions with formulas other than the ones tested. See text.

Calcium phosphate precipitation phenomena was evaluated in a series of parenteral nutrition admixtures composed of dextrose 22%, amino acids (FreAmine III) 2.7%, and fat emulsion (Abbott) 0, 1, and 3.2%. Incorporation of calcium gluconate 19 to 24 mEq/L and phosphate (as sodium) 22 to 28 mmol/L resulted in visible precipitation in the fat-free admixtures. New precipitate continued to form over 14 days, even after repeated filtrations of the solutions through 0.2- $\mu$ m filters. The

presence of the amino acids increased calcium and phosphate solubility, compared with simple aqueous solutions. However, the incorporation of the fat emulsion did not result in a statistically significant increase in calcium and phosphate solubility. The authors noted that the kinetics of calcium phosphate precipitate formation do not appear to be entirely predictable; both transient and permanent precipitation can occur either during the compounding process or at some time afterward. Because calcium phosphate precipitation can be very dangerous clinically, the use of inline filters was recommended. The authors suggested that the filters should have a porosity appropriate to the parenteral nutrition admixture—1.2  $\mu$ m for fat-containing and 0.2 or 0.45  $\mu$ m for fat-free nutrition mixtures.<sup>2061</sup>

A 2-mL fluid barrier of dextrose 5% in a microbore retrograde infusion set failed to prevent precipitation when used between calcium gluconate 200 mg/2 mL and sodium phosphate 0.3 mmol/0.1 mL.<sup>1385</sup>

A 2-in-1 parenteral nutrition admixture with final concentrations of TrophAmine 0.5%, dextrose 5%, L-cysteine hydrochloride 40 mg/g of amino acids, calcium gluconate 60 mg/100 mL, and sodium phosphates 46.5 mg/mL was found to result in visible precipitation of calcium phosphate within 30 hours stored at 23 to 27°C. Despite the presence of the acidifying L-cysteine hydrochloride, precipitation occurred at clinically utilized amounts of calcium and phosphates.<sup>2622</sup>

The presence of magnesium in solutions may also influence the reaction between calcium and phosphate, including the nature and extent of precipitation.<sup>158 159</sup>

The interaction of calcium and phosphate in parenteral nutrition solutions is a complex phenomenon. Various factors have been identified as playing a role in the solubility or precipitation of a given combination, including<sup>608 609 1042 1063 1427 2778</sup>:

1. Concentration of calcium
2. Salt form of calcium
3. Concentration of phosphate
4. Concentration of amino acids
5. Amino acids composition
6. Concentration of dextrose
7. Temperature of solution
8. pH of solution
9. Presence of other additives
10. Order of mixing

Enhanced precipitate formation would be expected from such factors as high concentrations of calcium and phosphate, increases in solution pH, decreased amino acid concentrations, increases in temperature, addition of calcium prior to phosphate, lengthy standing times or slow infusion rates, and use of calcium as the chloride salt.<sup>854</sup>

## Sodium Thiosulfate

AHFS 92:12

### Products

Sodium thiosulfate is available as a 250-mg/mL (25%) solution in 50-mL (12.5-g) vials alone<sup>3092</sup> or packaged with sodium nitrite injection as a kit (Nithiodote®).<sup>3093</sup> Each mL of solution also contains boric acid 2.8 mg and potassium chloride 4.4 mg.<sup>3092 3093</sup> The pH of the solution has been adjusted with boric acid and/or sodium hydroxide.<sup>3092 3093</sup> The drug also may contain trace impurities of sodium sulfite.<sup>3092 3093</sup>

### pH

From 7.5 to 9.5.<sup>3092 3093</sup>

### Trade Name(s)

Nithiodote

## Compatibility Information

### Additive Compatibility

# Somatropin

AHFS 68:28

## Products

Somatropin derived from *Escherichia coli* is available in vials and cartridges in sizes ranging from 1.5 to 24 mg, depending on the specific product. Each milligram represents about three units of activity. The commercially available dosage forms are variable in components and concentrations; care should be taken to follow the directions for the specific product being used. Most products are supplied in dry form requiring reconstitution using a diluent that is supplied with the product. Manufacturers' specific reconstitution instructions for each product should be followed. For products in vials, the specified amount of the diluent is injected into the somatropin container, aiming the stream at the container wall. The drug is reconstituted by gentle swirling using a rotary motion for most products but vigorous swirling for two minutes for Nutropin Depot. Vial inversion is recommended for reconstitution of Norditropin. Shaking is not recommended for any product and may damage the product.<sup>1</sup>

Norditropin Cartridges and Nutropin AQ are available as liquid injections not requiring dilution for use.<sup>1</sup>

Somatropin derived from mammalian cells (Saizen; Serostim) is available in vials in varying sizes from 4 to 8.8 mg, depending on the specific product. The manufacturer's specific reconstitution instructions for each product using the diluents provided should be followed. The specified amount of the diluent is injected into the somatropin container, aiming the stream at the container wall. The drug is dissolved by gentle swirling using a rotary motion, *not* shaking. Shaking is not recommended for any product and may damage the protein.<sup>1</sup>

## pH

The pH values cited by the manufacturers are as follows<sup>1</sup>:

Products	pH
Genotropin	about 6.7
Humatrope	about 7.5
Norditropin	about 7.3
Nutropin	about 7.4
Nutropin AQ	about 6.0
Saizen	6.5 to 8.5
Serostim	7.4 to 8.5

## Trade Name(s)

Norditropin, Nutropin AQ, Nutropin Depot, Saizen, Serostim

## Administration

Somatropin products are usually administered by subcutaneous injection. Humatrope and Saizen may also be administered intramuscularly.<sup>1</sup>

## Stability

Intact containers of somatropin products derived from *E. coli* should be stored under refrigeration and protected from freezing. Genotropin and Norditropin should also be protected from light during storage. Most somatropin products result in clear solutions when reconstituted correctly. Shaking may result in cloudiness, rendering the products unacceptable for use. Reconstituted Nutropin Depot is a thick, milky suspension.<sup>1</sup>

Stability after reconstitution is variable among the products and depends on whether a preservative-containing diluent is used. See Table 1. Unpreserved reconstituted products of Genotropin and Humatrope should be stored under refrigeration and used within 24 hours. Nutropin Depot suspension should be used immediately upon reconstitution, discarding any unused remainder. Products reconstituted with the specified preserved diluents are stable for longer periods. After reconstitution with the appropriate preserved diluent, Norditropin and Nutropin are stable for 14 days, Genotropin for 21 days, and Humatrope for 28 days stored under refrigeration. Nutropin AQ is stable for 28 days after initial stopper penetration when stored under refrigeration.<sup>1</sup>

Intact containers of somatropin products derived from mammalian cells should be stored at controlled room temperature. Saizen reconstituted with the preserved diluent provided is stable for 14 days after reconstitution when stored under refrigeration. Serostim reconstituted with the unpreserved diluent provided is stable for 24 hours stored under refrigeration. Freezing of reconstituted solutions should be avoided.<sup>1</sup>

**Table 1. Recommended stability periods for somatropin products using diluents with and without preservatives and stored under refrigeration<sup>1</sup>**

Product	Stability Period
<b>Diluent with Preservative</b>	
Genotropin 5.8 and 13.8 mg	21 days
Humatrope	28 days
Norditropin	14 days
Nutropin	14 days
Nutropin AQ	28 days <sup>a</sup>
Saizen	14 days
<b>Diluent without Preservative</b>	
Genotropin 1.5 mg	24 hr
Humatrope	24 hr
Serostim	24 hr

<sup>a</sup> Period after initial penetration of the vial stopper of this liquid product.

### Syringes

Somatropin (Humatrope) was reconstituted to concentrations of 1 and 3.33 mg/mL with the accompanying diluent; the diluent contains glycerin 1.7% and *m*-cresol 0.3% as a preservative. The reconstituted product at each concentration was packaged in 1-mL plastic syringes with barrels composed of polypropylene (Becton Dickinson) or propylene–ethylene copolymer (Terumo) and capped and stored under refrigeration at about 5°C for 28 days. Little or no loss of somatropin occurred stored in either

syringe. The solutions remained visually acceptable for 28 days in the polypropylene syringes, but an unacceptable turbidity formed within 21 days in the propylene–ethylene copolymer syringes, which became a precipitate by 28 days. The preservative, *m*-cresol, concentrations fell up to 4% but remained above the minimum acceptable concentration. Somatropin should be stored no more than 14 days at 5°C in propylene–ethylene copolymer syringes. Storage up to 28 days was acceptable in the polypropylene syringes.<sup>2210</sup>

# Sterile Water for Injection

## AHFS 96:00

### Products

Sterile water for injection is available in ampuls, vials, and plastic bags in sizes ranging from 5 mL to 5 L. This diluent is a pharmaceutical aid that contains no antimicrobial preservative or any other solute but must have drugs or other solutes added prior to administration.<sup>1(2/08)</sup>

### pH

From 5 to 7.<sup>1(2/08)</sup>

### Osmolality

Sterile water for injection has an osmolality of 0 mOsm/kg. It is incompatible with blood and will cause hemolysis if administered intravenously in sufficient quantity.<sup>1(2/08)</sup>

### Administration

Sterile water for injection is intended for use as a pharmaceutical aid in dissolving or diluting drugs for subcutaneous, intramuscular, and intravenous injection. It must not be administered intravenously without the addition of a sufficient amount of drugs or

other solutes to provide adequate osmolality to make the solution approximately isotonic.<sup>1(2/08)</sup> Death and injury have resulted from hemolysis caused by intravenous administration of a sufficient volume of sterile water for injection and other low-osmolality solutions.<sup>4 1942 2072 2073 2481 2482</sup>

For patient safety, medical orders for large volumes of sterile water for injection, especially plastic bags of any size, without the addition of sufficient drug or solute to render the solutions approximately isotonic (about 308 mOsm/kg) should not be permitted. Immediate consultation with the prescriber or referral to the institutional medical peer review process may be necessary to avoid possible patient harm. Large-volume containers of sterile water for injection should be stored only in pharmacies and not in patient care areas. Suitable warnings near the stored product and computer system alerts should remind staff that sterile water for injection is for diluent use only.<sup>2481</sup>

### Stability

The intact single-use containers of sterile water for injection should be stored at controlled room temperature.<sup>1(2/08)</sup>

Selected Revisions July 1, 2020. © Copyright, October 2004. American Society of Health-System Pharmacists, Inc.

## Streptomycin Sulfate

### AHFS 8:12.02

#### Products

Streptomycin sulfate is available as a lyophilized powder for injection in vials containing 1 g of drug with no preservatives. Reconstitute with 4.2, 3.2, or 1.8 mL of sterile water for injection to yield solutions containing 200, 250, or 400 mg/mL, respectively.<sup>4</sup>

#### pH

The reconstituted injection at a concentration of 200 mg/mL has a pH of 4.5 to 7.<sup>1(8/08) 4</sup>

#### Administration

Streptomycin sulfate is administered by deep intramuscular injection well within the body of a relatively large muscle, such

as the upper outer quadrant of the buttock in adults or the midlateral thigh in adults or children. Injection sites should be alternated.<sup>1(8/08) 4</sup> Intravenous injection is not recommended<sup>4</sup>, although it has been performed.<sup>1603</sup>

#### Stability

Intact vials of streptomycin sulfate lyophilized powder should be stored at controlled room temperature and protected from light.<sup>1(8/08) 4</sup>

Reconstituted solutions of streptomycin sulfate are stated to be stable for one week at room temperature and protected from light. However, no preservatives are present and the possibility of microbiological contamination must be considered.<sup>1(8/08) 4</sup>

## Streptozocin

### AHFS 10:00

#### Products

Streptozocin is available in single-dose vials containing 1 g of drug and 220 mg of citric acid anhydrous. Sodium hydroxide may have been used to adjust the pH.<sup>1(5/07)</sup>

Reconstitute with 9.5 mL of sodium chloride 0.9% or dextrose 5% to provide a 100-mg/mL solution.<sup>1(5/07) 4</sup>

#### pH

From 3.5 to 4.5.<sup>1(5/07)</sup>

#### Trade Name(s)

Zanosar

#### Administration

Streptozocin may be administered by rapid intravenous injection or intravenous infusion over 15 minutes to six hours.<sup>1(5/07) 4</sup>

#### Stability

Intact vials containing a pale yellow powder should be refrigerated and protected from light.<sup>1(5/07) 4</sup>

The pale gold reconstituted solution is stable for 48 hours at room temperature or 96 hours under refrigeration.<sup>4</sup> However, the manufacturer recommends use within 12 hours because the product does not contain an antibacterial preservative.<sup>1(5/07) 4</sup>

Streptozocin (Upjohn) 3 mg/mL in sodium chloride 0.9% did not support the growth of *Staphylococcus aureus*, *Enterococcus faecium*, *Pseudomonas aeruginosa*, and *Candida albicans* with loss of viability over 24 hours at room temperature. Even so, admixtures should be stored under refrigeration whenever possible, and the potential for microbiological growth should be considered when assigning expiration periods.<sup>2740</sup>

#### Filtration

Streptozocin 10 to 200 mcg/mL exhibited no loss due to sorption to either cellulose nitrate/cellulose acetate ester (Millex OR) or Teflon (Millex FG) filters.<sup>1415 1416</sup>

# Succinylcholine Chloride

**AHFS 12:20.20**

## Products

Succinylcholine chloride is available in a concentration of 20 mg/mL in 5- and 10-mL multiple-dose vials and 5-mL syringes. The vials are preserved with parabens or benzyl alcohol and may contain sodium chloride for isotonicity and hydrochloric acid for pH adjustment. Succinylcholine chloride is also available in higher concentrations of 50 mg/mL in 10-mL ampuls and 100 mg/mL in 10-mL single-dose vials.<sup>1(4/08) 4</sup>

## pH

From 3 to 4.5.<sup>1(4/08) 4</sup>

## Osmolality

The osmolality of succinylcholine chloride 50 mg/mL was determined to be 409 mOsm/kg.<sup>1233</sup>

## Trade Name(s)

Anectine, Quelicin

## Administration

Succinylcholine chloride is usually administered by direct intermittent intravenous injection or intravenous infusion. For continuous intravenous infusion, a 1- to 2-mg/mL (0.1 to 0.2%) solution is prepared, usually in 250 to 1000 mL of compatible fluid. If necessary, when a suitable vein is inaccessible, a maximum of 150 mg of the drug may be administered by deep intramuscular injection, preferably high into the deltoid muscle.<sup>1(4/08) 4</sup>

## Stability

Commercially available injections of succinylcholine chloride should be stored at 2 to 8°C to retard loss.<sup>1(4/08) 4</sup> Succinylcholine chloride injection in the original unopened containers is stated in the labeling to be stable for 14 days at room temperature.<sup>1(4/08) 1433</sup>

Studies indicate that succinylcholine chloride injection in original unopened containers may be stable at room temperature for longer periods. The manufacturer of Quelicin has stated that the drug was stable for 3 months at temperatures up to 25°C.<sup>1239 2745</sup> More recently, Hospira has stated that Quelicin is stable only for 30 days at room temperature.<sup>2783</sup>

Research studies have also looked at the stability of succinylcholine chloride above refrigeration temperature. In one study, storage for 7 days at 40°C followed by storage at 25°C for four weeks was used to simulate the worst case of shipping followed by storage on an emergency cart. Calculated loss at room temperature was 1%/week; at 40°C, it was 3.2%/week. Therefore, the loss was estimated to be about 7% under such conditions.<sup>960</sup>

In another study, similar results were found. The decomposition rate of succinylcholine chloride was dependent on

both concentration and temperature. The calculated degradation rates at room temperature were all higher for the 50-mg/mL concentration (2.1%/month) compared to the 20-mg/mL injection (1.2%/month). The time to 10% decomposition on an emergency cart was about 4.8 months for the 50-mg/mL concentration and was about 8.3 months for the 20-mg/mL concentration. Refrigeration cut the decomposition rates to 0.3 and 0.18% per month, respectively.<sup>2742</sup>

However, a somewhat shorter time to 10% decomposition at room temperature has also been reported. Commercial vials of succinylcholine chloride 20 mg/mL (Quelicin) stored at room temperature were found to decompose about 10 to 11% drug in 6 months. The authors recommended limiting room temperature storage to not more than 6 months.<sup>2763</sup>

After dilution of succinylcholine chloride to a concentration of 1 or 2 mg/mL in sodium chloride 0.9%, the drug is stated to be chemically stable for 4 weeks at 5°C and 1 week at 25°C. However, use within 24 hours of preparation is recommended along with discarding any unused solution.<sup>1(4/08) 4</sup>

## pH Effects

Succinylcholine chloride is unstable in alkaline solutions<sup>1(4/08) 4</sup> and decomposes in solutions with a pH greater than 4.5.<sup>4</sup> The pH of maximum stability was found to be 3.75 to 4.50.<sup>960</sup>

In combination with barbiturates, either free barbituric acid will precipitate or the succinylcholine chloride will be hydrolyzed, depending on the final pH of the admixture.<sup>1(4/08) 4 21</sup> Succinylcholine chloride should not be mixed with barbiturates in the same syringe or given simultaneously through the same needle.<sup>1(4/08)</sup>

## Syringes

Succinylcholine chloride (Abbott) 20 mg/mL was packaged in both glass and polypropylene syringes (Becton Dickinson) sealed with rubber luer-tip caps (Becton Dickinson). The syringes were stored for 45 days at 4°C, 22°C and 50% relative humidity, and 37°C and 85% relative humidity. At 4°C, there was little or no succinylcholine chloride loss after 45 days in either glass or plastic syringes. At 22°C and 50% relative humidity, about a 5% loss occurred in 45 days. However, at 37°C and 85% relative humidity, the drug concentration fell below the acceptable USP limit after about 30 days.<sup>1209</sup>

Succinylcholine chloride (Burroughs Wellcome) 20 mg/mL in dextrose 5% and in sodium chloride 0.9% (Baxter) was packaged as 10 mL in 12-mL plastic syringes (Monoject) and wrapped in aluminum foil. Little or no loss of succinylcholine chloride occurred during 107 days of storage at 5°C. At 25°C, about 5 to 6% loss occurred in 100 days. Samples at an elevated temperature of 40°C were stable through 22 days with only 3 to 4% loss but exhibited 12 to 14% loss at 63 days.<sup>1892</sup>

Succinylcholine chloride (Abbott) 20 mg/mL was packaged as 8 mL of undiluted injection in 12-mL polypropylene syringes (Becton Dickinson) and was stored at 4°C and 25°C exposed to fluorescent light. The injection remained visually clear at both temperatures. Little or no loss of succinylcholine chloride occurred in 90 days when stored at 4°C. However, at 25°C losses of about 6, 10, and 12% occurred in 45, 60, and 90 days, respectively.<sup>2438</sup>

Syringes prefilled with succinylcholine chloride injection for emergency use have been reported to freeze upon storage under refrigeration. Care should be taken to make sure that refrigerators are operating within compendial temperature ranges to ensure the availability of stored drugs in emergencies.<sup>2698 2699</sup>

## Sufentanil Citrate

AHFS 28:08.08

### Products

Sufentanil citrate is available as a preservative-free aqueous injection in 1-, 2-, and 5-mL ampuls and vials. Each mL of solution contains sufentanil citrate equivalent to 50 mcg of sufentanil base.<sup>1(7/07)</sup>

### pH

From 3.5 to 6.<sup>1(7/07)</sup>

### Trade Name(s)

Sufenta

### Administration

Sufentanil citrate is administered intravenously by slow injection or infusion. For labor and delivery, it may be administered epidurally. The drug has also been given intramuscularly.<sup>1(7/07) 4</sup>

### Stability

Sufentanil citrate is a stable, clear, aqueous, preservative-free injection. The product should be stored at controlled room temperature and protected from light.<sup>1(7/07) 4</sup>

### pH Effects

Sufentanil citrate is hydrolyzed in acidic solutions. A 5-mcg/mL solution with a pH greater than 3 lost less than 1% in 48 weeks at 90°C. However, at a pH of less than 2, the drug loss was 14% at 60°C and 32% at 90°C in 48 weeks.<sup>1755</sup>

### Freezing Solutions

Sufentanil citrate (Janssen) 5 mcg/mL in sodium chloride 0.9% became nonhomogeneous and difficult to restore to homogeneity when frozen at -20°C.<sup>1755</sup>

### Syringes

Sufentanil citrate (Janssen) 2 mcg/mL in sodium chloride 0.9% was packaged in 50-mL polypropylene syringes (Omnifix, B. Braun) and stored at 21°C. Less than 10% sufentanil loss occurred in 24 hours.<sup>2201</sup>

### Ambulatory Pumps

Sufentanil citrate 50 mcg/mL was evaluated in CADD-1 and CADD-PRIZM medication cassettes. About 4% drug loss occurred in 14 days at room and refrigeration temperatures.<sup>2717</sup>

### Sorption

Sufentanil citrate (Janssen) demonstrated loss from solutions in concentrations from 1 to 20 mcg/mL due to sorption to

polyvinyl chloride (PVC)/Kalex 3000 reservoirs for use with CADD pumps (Pharmacia Deltec) and administration tubing.<sup>790</sup>

Sufentanil citrate (Janssen) 2 mcg/mL in sodium chloride 0.9% was delivered from 50-mL polypropylene syringes (Omnifix, B. Braun) by a syringe pump (JMS-Syringe-Pump Model SP-100, Japan Medical Supply Company) through polyethylene extension sets (Original-Perfusor-Leitung, Type PE, B. Braun) or PVC extension sets (Original-Perfusor-Leitung, Type N, B. Braun), 0.2- $\mu$ m epidural filters (Sterifix, B. Braun), and epidural catheters (Perifix, B. Braun) over 24 hours. The pump, syringes, and extension sets were kept at 21°C while the filters and epidural catheters were kept at 36°C. Running at 1 mL/hr, the delivered sufentanil concentration using PVC tubing was about 7 to 10% below the theoretical concentration throughout 24 hours. Using polyethylene tubing, losses were about 16% initially but the concentration returned to expected levels within 1 to 2 hours and remained stable throughout the 24-hour delivery.<sup>2201</sup>

### Filtration

Sufentanil citrate (Janssen) 50 mcg/10 mL in sodium chloride 0.9% was evaluated for drug loss when administered through filters or epidural catheters; 2.5-g cellulose acetate/cellulose nitrate 0.2- $\mu$ m filters (Millex, Millipore) were utilized. Approximately 20% of the sufentanil was lost to the void volume and/or adsorption. This loss should be considered when a new filter is used.<sup>1667</sup>

Sufentanil citrate (Janssen) 2 mcg/mL in sodium chloride 0.9% delivered at 1 mL/hr through 0.2- $\mu$ m epidural filters (Sterifix, B. Braun) during the first hour was 83% of the theoretical concentration and remained at reduced concentrations of 85 to 89% of theoretical through at least 6 hours. By 24 hours the concentration was near 96% of theoretical. The authors attributed the lower concentrations to sorption of sufentanil onto the filter.<sup>2201</sup>

In addition, sufentanil citrate (Janssen) demonstrated varying amounts of loss from solutions in concentrations ranging from 1 to 20 mcg/mL due to sorption to several filters including Millex-OR, Minisart NML, Schleicher & Schuell FP 30/3, and Sterifix EF.<sup>790</sup>

Sufentanil citrate was found to undergo sorption to 0.22- $\mu$ m polyamide epidural filters (Perifix, Braun Melsungen). Delivery of a 5-mcg/mL solution through the filter resulted in nearly total loss of the drug from the first mL. 3 mL had to be passed through the filter before the delivered drug concentration was near the original concentration.<sup>2545</sup>

# Sugammadex Sodium

AHFS 92:12

## Products

Sugammadex is available as a 100-mg/mL solution in 2- and 5-mL single-use vials as the sodium salt.<sup>3111</sup> The solution also contains hydrochloric acid and/or sodium hydroxide for pH adjustment.<sup>3111</sup>

### pH

The pH is adjusted to a range of 7 to 8.<sup>3111</sup>

### Osmolality

The osmolality of sugammadex sodium 100-mg/mL solution is within the range of 300 to 500 mOsm/kg.<sup>3111</sup>

### Trade Name(s)

Bridion

## Administration

Sugammadex should be administered intravenously as a single bolus injection over 10 seconds into an existing intravenous line.<sup>3111</sup> The intravenous line should be adequately flushed with a compatible infusion solution (e.g., sodium chloride 0.9%) prior to and following administration of sugammadex.<sup>3111</sup>

## Stability

Sugammadex injection is a clear, colorless to slightly yellow-brown solution.<sup>3111</sup> Intact vials of the drug should be stored at controlled room temperature and protected from light.<sup>3111</sup> Vials not protected from light should be used within 5 days.<sup>3111</sup>

## Sumatriptan Succinate

AHFS 28:32.28

### Products

Sumatriptan succinate is available at a concentration of 6 mg/0.5 mL with sodium chloride 3.5 mg/0.5 mL in water for injection in single-dose vials and prefilled syringes. The drug is also available at a concentration of 4 mg/0.5 mL with sodium chloride 3.8 mg/0.5 mL in water for injection in prefilled syringes.<sup>1(11/06)</sup>

### pH

Approximately 4.2 to 5.3.<sup>1(11/06)</sup>

### Osmolality

The solution is nearly isotonic with an osmolality of 291 mOsm/kg.<sup>1(11/06)</sup>

### Trade Name(s)

Imitrex

### Administration

Sumatriptan succinate is administered subcutaneously. It should not be given by other routes of administration.<sup>1(11/06)</sup>

### Stability

Intact containers of sumatriptan succinate should be stored between 2 and 30°C and protected from light. The injection is a clear, colorless to light yellow solution.<sup>1(11/06)</sup>

### Syringes

The stability of sumatriptan succinate (Glaxo Wellcome) 12 mg/mL packaged as 1 mL of solution drawn into 1-mL polypropylene tuberculin syringes was evaluated stored under refrigeration and at room temperature of 25°C both exposed to and protected from fluorescent light. The room temperature samples were evaluated over 24 hours while the refrigerated samples were evaluated over 72 hours. No visible indications of physical instability were observed, and no loss of sumatriptan was found.<sup>2276</sup>

## Tacrolimus

AHFS 92:44

### Products

Tacrolimus concentrate for injection is available in 1-mL ampuls containing the equivalent of 5 mg of anhydrous tacrolimus per mL.<sup>3127</sup> In addition to tacrolimus, each mL contains polyoxyl 60 hydrogenated castor oil (surfactant) 200 mg and dehydrated alcohol, USP, 80% (v/v).<sup>1683 3127</sup> The product is a concentrate that must be diluted in sodium chloride 0.9% or dextrose 5% prior to administration.<sup>3127</sup>

### Trade Name(s)

Prograf

### Administration

Tacrolimus is administered only by continuous intravenous infusion following dilution to a final concentration of 0.004 to 0.02 mg/mL (4 to 20 mcg/mL) in sodium chloride 0.9% or dextrose 5%.<sup>3127</sup> Intravenous solution containers should be composed of glass or polyethylene; polyvinyl chloride (PVC) containers should be avoided due to potential leaching of diethylhexyl phthalate (DEHP) plasticizer and decreased stability of the drug.<sup>3127</sup> For more dilute solutions of tacrolimus, non-PVC tubing also should be used to minimize the potential for significant drug adsorption onto the tubing.<sup>3127</sup>

### Stability

Intact ampuls should be stored at temperatures between 5 and 25°C.<sup>3127</sup> Diluted solutions for infusion in glass or polyethylene containers should be discarded after 24 hours.<sup>3127</sup> Solutions should be visually inspected for particulate matter and discoloration prior to administration.<sup>3127</sup>

Tacrolimus exhibits a minimum rate of decomposition at pH values between 2 and 6; the rate of decomposition increases substantially at higher pH values<sup>1926</sup> and is unstable above pH 9.<sup>2216</sup> The manufacturer recommends that tacrolimus not be mixed with or even co-infused with solutions having a pH of 9 or greater (e.g., solutions containing acyclovir or ganciclovir).<sup>3127</sup>

### Syringes

Tacrolimus (Fujisawa) 100 mcg/mL in sodium chloride 0.9% was packaged as 20 mL in 30-mL plastic syringes (Becton Dickinson) and stored at 24°C exposed to normal room light and protected from light. No decrease in tacrolimus concentration was found after storage for 24 hours.<sup>1864</sup>

### Sorption

Tacrolimus (Fujisawa) 100 mcg/mL in dextrose 5% was delivered through PVC anesthesia extension tubing (Abbott), PVC intravenous administration set tubing (Venoset, Abbott), and fat emulsion tubing (Abbott). The delivered solutions had no loss of tacrolimus using the PVC administration set tubing and the fat emulsion tubing and only 2.5% drug loss from the PVC anesthesia extension tubing.<sup>1864</sup>

Tacrolimus 50 mcg/mL delivered through 100 cm of PVC tubing at a rate of 5 mL/hr resulted in the delivery of 76% of the tacrolimus concentration. No loss due to sorption occurred when the tacrolimus solution was delivered through polyolefin tubing.<sup>2452</sup>

### Plasticizer Leaching

Parenteral products containing a large amount of surfactant in the formulation, such as tacrolimus injection, will extract the plasticizer DEHP from PVC containers and administration sets.<sup>1683 3127</sup> Consequently, use of PVC containers with tacrolimus should be avoided.<sup>3127</sup> Instead, glass or polyethylene containers and PVC-free tubing are recommended.<sup>1683 3127</sup>

Tacrolimus 50 mcg/mL delivered through 100 cm of PVC tubing at a rate of 5 mL/hr leached 12 mcg/mL of DEHP into the drug solution. No plasticizer leached when the tacrolimus solution was delivered through similar polyolefin tubing.<sup>2452</sup>

Tacrolimus 0.02 mg/mL in dextrose 5% in VISIV polyolefin bags was tested at room temperature near 23°C for 24 hours. No leached plastic components were found within the 24-hour study period.<sup>2660 2792</sup>

<sup>a</sup> Tested in dextrose 5%.

<sup>b</sup> Tested in sodium chloride 0.9%.

<sup>c</sup> Diluted with sterile water for injection.

<sup>d</sup> Refer to Appendix for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>e</sup> Ampicillin component. Ampicillin in a 2:1 fixed-ratio concentration with sulbactam.

<sup>f</sup> Trimethoprim component. Trimethoprim in a 1:5 fixed-ratio concentration with sulfamethoxazole.

<sup>g</sup> Not specified whether concentration refers to single component or combined components.

<sup>h</sup> Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>i</sup> Ceftolozane component. Ceftolozane in a 2:1 fixed-ratio concentration with tazobactam.

# Tedizolid Phosphate

AHFS 8:12.28.24

## Products

Tedizolid phosphate is a prodrug that is metabolized in vivo to tedizolid.<sup>2913</sup> Tedizolid phosphate is available as a lyophilized powder or cake in single-use (unpreserved) vials containing 200 mg of the drug and mannitol 105 mg.<sup>2913</sup> Sodium hydroxide and hydrochloric acid also are present in minimal quantities to adjust the pH.<sup>2913</sup>

Reconstitute the 200-mg vial with 4 mL of sterile water for injection.<sup>2913</sup> Gently swirl the vial to aid dissolution and let stand until the cake has completely dissolved and any foam has disappeared.<sup>2913</sup> To minimize foaming, avoid vigorous agitation or shaking during and after reconstitution.<sup>2913</sup> Inspect the vial to ensure that the solution contains no particulate matter and that no undissolved cake or powder remains attached to the vial wall; if undissolved drug remains, invert the vial and gently swirl to dissolve the remainder.<sup>2913</sup>

Do not invert the vial during withdrawal of the dose; instead, keeping the vial in the upright position, use a syringe with an appropriately sized needle to withdraw 4 mL of the reconstituted solution from the bottom corner of the tilted vial.<sup>2913</sup> Dilute the reconstituted solution only in 250 mL of sodium chloride 0.9%.<sup>2913</sup> Invert the bag gently to mix; do not shake because foaming may occur.<sup>2913</sup>

Sodium chloride 0.9%		CUB	800 mg	Stated to be stable up to 24 hours at room temperature or at 2 to 8°C	2913	C

## Administration

Tedizolid phosphate is administered by intravenous infusion over 1 hour after dilution of the reconstituted solution in 250 mL of sodium chloride 0.9%.<sup>2913</sup> If a common infusion line is being used to administer other drugs, the line should be flushed with sodium chloride 0.9% prior to and following infusion of tedizolid phosphate.<sup>2913</sup> Tedizolid is incompatible with any solutions that contain divalent cations (e.g., calcium, magnesium).<sup>2913</sup>

## Stability

Intact vials of tedizolid phosphate should be stored at controlled room temperature.<sup>2913</sup> Tedizolid phosphate is a white to off-white powder that forms a clear, colorless to pale yellow solution when reconstituted with sterile water for injection and when further diluted in sodium chloride 0.9%.<sup>2913</sup> The manufacturer states that the reconstituted drug and the diluted solution may be stored under refrigeration or at room temperature.<sup>2913</sup> The total time from reconstitution to dilution to administration should not exceed 24 hours.<sup>2913</sup>

## Filtration

Tedizolid phosphate (Cubist) was filtered through a 0.22-µm inline filter.<sup>2914</sup> No significant loss in potency or changes in appearance or impurity levels were observed.<sup>2914</sup>

<sup>e</sup> Imipenem component. Imipenem in a 1:1 fixed-ratio concentration with cilastatin.

<sup>f</sup> Test performed using the formulation WITH edetate disodium.

<sup>g</sup> Piperacillin component. Piperacillin in an 8:1 fixed-ratio concentration with tazobactam.

<sup>h</sup> Concentration of fosphenytoin expressed in milligrams of phenytoin sodium equivalents (PE) per mL.

<sup>i</sup> Test performed using the Cubicin formulation.

<sup>j</sup> As epinephrine base rather than the salt.

<sup>k</sup> Meropenem component. Meropenem in a 1:1 fixed-ratio concentration with vaborbactam.

<sup>l</sup> Ceftazidime component. Ceftazidime in a 4:1 fixed-ratio concentration with avibactam sodium.

# Teicoplanin

**AHFS 8:12.28.16**

## Products

Teicoplanin is available as a lyophilized powder in single-use vials containing teicoplanin 100, 200, or 400 mg.<sup>3412 3413 3414 3415 3416</sup> Each vial also contains sodium chloride and sodium hydroxide to adjust the pH.<sup>3412 3413 3414 3415 3416</sup> Some vials of teicoplanin are packaged with an accompanying ampul of water for injection for use as a diluent.<sup>3413 3414 3416</sup>

To prepare teicoplanin for injection or infusion, the 100-mg vials should be reconstituted with 1.7 mL<sup>3415</sup> and most 200- and 400-mg vials should be reconstituted with 3.14 mL of sterile water for injection, either from a separate vial or from the accompanying ampul of diluent, when provided; the diluent should be injected slowly down the side of the vial wall.<sup>3412 3413 3414 3415</sup> Vials should be rolled gently until the powder is completely dissolved and should not be shaken.<sup>3412 3413 3414 3415 3416</sup> Care should be taken to avoid the formation of foam; if foam develops, the solution should be allowed to stand for 15 minutes until it subsides.<sup>3412 3413 3414 3415 3416</sup> The resulting reconstituted solutions contain teicoplanin 100 mg/1.5 mL, 200 mg/3 mL, or 400 mg/3 mL.<sup>3412 3413 3414 3415 3416</sup> Errors in reconstitution can result in the formation of a stable foam and the delivery of doses that are smaller than intended.<sup>3413 3414 3416</sup> Reconstituted teicoplanin solutions should be extracted slowly from the vial using a syringe (e.g., a 5-mL syringe with a 23-gauge needle).<sup>3412 3413 3414 3415 3416</sup>

The reconstituted solution may be administered by direct injection without further dilution or administered as an intravenous infusion after dilution in a compatible infusion solution.<sup>3412 3413 3414 3415 3416</sup> Most manufacturers recommend dilution of the reconstituted solution in sodium chloride 0.9%, Ringer's injection, Ringer's injection, lactated, dextrose 5 or 10%, dextrose 4% in sodium chloride 0.18%, or dextrose 5% in sodium chloride 0.45%.<sup>3412 3413 3414 3415 3416</sup> Some manufacturers also state that teicoplanin can be prepared in compounded sodium lactate solution<sup>3413 3414</sup> and Hartmann's solution.<sup>3416</sup> Specific product labeling should be consulted.

## Equivalency

Each milligram of teicoplanin is equivalent to not less than 1000 international units.<sup>3412 3414 3415</sup>

## pH

The pH of teicoplanin (Sanofi-Aventis) 133.3-mg/mL reconstituted solution ranges from 7.2 to 7.8.<sup>3414</sup>

## Tonicity

Teicoplanin (Sanofi-Aventis) 133.3-mg/mL reconstituted solution is isotonic.<sup>3414</sup>

## Trade Name(s)

Targocid

## Administration

Teicoplanin may be administered after reconstitution either intramuscularly, with a maximum of 3 mL in a single site, or by direct intravenous injection over 3 to 5 minutes.<sup>3412 3413 3414 3416</sup>

The drug also may be administered as an intravenous infusion over 30 minutes after dilution in a compatible infusion solution.<sup>3412 3413 3414 3415 3416</sup> Only intravenous infusion should be used to administer the drug in neonates.<sup>3412 3415</sup>

Teicoplanin should not be administered intraventricularly.<sup>3412 3413 3414 3415 3416</sup> Safety and efficacy of administration of teicoplanin by the intrathecal route has not been evaluated.<sup>3413 3416</sup>

Manufacturers state that teicoplanin should not be admixed with aminoglycosides due to incompatibility.<sup>3412 3413 3414 3415 3416</sup> Some manufacturers state that administration of teicoplanin must occur separately from other parenteral antibiotics if combination therapy is used.<sup>3412 3415</sup>

## Stability

Intact vials of teicoplanin should be stored below 25°C.<sup>3414 3415 3416</sup> Reconstituted and diluted solutions of teicoplanin ideally should be used immediately after preparation, but may be stored under refrigeration at 2 to 8°C for at least 24 hours;<sup>3412 3413 3414 3415 3416</sup> specific product labeling should be consulted. Several manufacturers state that teicoplanin should not be stored in syringes.<sup>3413 3414 3416</sup>

Teicoplanin forms dextrose aldehyde adducts when diluted in dextrose-containing solutions. Equilibrium is reached faster at room temperature (7 days) than with refrigerated storage (30 days). The equilibrium concentration of the adduct is directly related to the dextrose concentration. The reaction is reversible with dilution.<sup>2046</sup>

The stability of catheter flush solutions composed of teicoplanin 133 mg/mL in water for injection, or heparin sodium 10 units/mL or 100 units/mL, was evaluated in Hickman catheters at 25°C over 24 hours. No decomposition products formed, and no loss was found. Indeed, a small (11%) increase in teicoplanin concentration was observed which was attributed to loss of water.<sup>2165</sup>

## Syringes

Several manufacturers state that teicoplanin should not be stored in syringes.<sup>3413 3414 3416</sup>

<sup>d</sup> Run at 100 mL/hr.

## Additional Compatibility Information

### Peritoneal Dialysis Solutions

Some manufacturers state that teicoplanin can be administered in peritoneal dialysis solutions containing 1.36 or 3.86% dextrose.<sup>3412 3415</sup>

Teicoplanin (Marion Merrell Dow) 0.025 mg/mL in Dianeal PD-2 with dextrose 1.5% in polyvinyl chloride (PVC) containers was physically and chemically stable for 24 hours at 25°C exposed to light, exhibiting no loss; additional storage for 8 hours at 37°C resulted in losses of 6% or less. Under refrigeration at 4°C protected from light, no loss occurred in 7 days. Additional storage for 16 hours at 25°C followed by 8 hours at 37°C resulted in about 7% loss.<sup>1989</sup>

Ceftazidime (Glaxo) 0.1 mg/mL admixed with teicoplanin (Marion Merrell Dow) 0.025 mg/mL in Dianeal PD-2 with dextrose 1.5% in PVC containers did not result in a stable mixture. Large (but variable) teicoplanin losses generally in the

20% range were noted in as little as 2 hours at 25°C exposed to light. Ceftazidime losses of about 9% occurred in 16 hours. Refrigeration and protection from light of the peritoneal dialysis admixture reduced losses of both drugs to negligible levels. Even so, admixing these 2 drugs was not recommended because of the high levels of teicoplanin loss at room temperature.<sup>1989</sup>

Teicoplanin (Merrell Dow) 25 mg/L in Dianeal 137 with dextrose 1.36% (Baxter) was evaluated for stability over 42 days. Stored at 4°C, teicoplanin retained stability with a loss of less than 5% in 42 days. At 20°C, 10% loss occurred in about 25 days with 17% loss in 42 days. At an elevated temperature of 37°C, a much greater rate of decomposition occurs with over 40% loss occurring in 42 days.<sup>2145</sup>

Manufacturers state that teicoplanin should not be admixed with aminoglycosides due to incompatibility;<sup>3412 3413 3414 3415</sup> however, several manufacturers state that the drugs *are* compatible when combined in dialysis fluid.<sup>3412 3415</sup> Specific product labeling should be consulted.

## Telavancin Hydrochloride

AHFS 8:12.28.16

### Products

Telavancin hydrochloride is available as a lyophilized powder in single-use vials containing telavancin 250 and 750 mg as the hydrochloride.<sup>2831</sup> Also present are hydroxypropyl-beta-cyclodextrin, mannitol, and sodium hydroxide and hydrochloric acid to adjust pH.<sup>2831</sup>

The 250-mg vial should be reconstituted with 15 mL and the 750-mg vial with 45 mL of dextrose 5%, sterile water for injection, or sodium chloride 0.9% and mixed thoroughly to yield a telavancin concentration of 15 mg/mL.<sup>2831</sup> To minimize foaming during reconstitution, allow the vacuum of the vial to draw the diluent from the syringe into the vial; do not forcefully inject the diluent.<sup>2831</sup> Any vial that does not have a vacuum should be discarded.<sup>2831</sup> Dissolution may occasionally require up to 20 minutes.<sup>2831</sup> Do not forcefully shake the vial or the diluted solution in the infusion bag.<sup>2831</sup>

### pH

From 4 to 5.<sup>2831</sup>

### Trade Name(s)

Vibativ

### Administration

Telavancin is administered by intravenous infusion over 60 minutes after dilution in a compatible infusion solution.<sup>2831</sup> For telavancin doses of 150 to 800 mg, dilution in 100 to 250 mL

is recommended.<sup>2831</sup> For doses outside this range, dilution to a concentration of 0.6 to 8 mg/mL is recommended.<sup>2831</sup> The manufacturer recommends dilution in dextrose 5%; sodium chloride 0.9%; or Ringer's injection, lactated.<sup>2831</sup>

### Stability

Intact vials of telavancin hydrochloride should be stored under refrigeration.<sup>2831</sup> The reconstituted drug in the vial and the diluted solution in the infusion bag should be used within 12 hours if stored at room temperature or 7 days if stored under refrigeration.<sup>2831 3097</sup> The total time for the reconstituted drug in the vial and the diluted solution in the infusion bag together should not exceed 12 hours at room temperature or 7 days under refrigeration.<sup>2831 3097</sup>

### Freezing Solutions

The manufacturer states that the diluted solution of telavancin in the infusion bag can be stored at  $-30$  to  $-10^{\circ}\text{C}$  for up to 32 days.<sup>2831</sup> Telavancin (Ben Venue) 0.6 and 8 mg/mL diluted in sodium chloride 0.9% or dextrose 5% in polyvinyl chloride (PVC) and non-PVC infusion bags and stored at  $-20^{\circ}\text{C}$  exhibited less than 10% loss of the drug during the 32-day study period.<sup>3096</sup> The authors recommended that solutions be brought to room temperature without any assistance (e.g., sonication, hot water bath) and used immediately after thawing, or within 12 hours at room temperature; thawed solutions should not be refrozen.<sup>3096</sup>

## Temozolomide

### AHFS 10:00

#### Products

Temozolomide is available as a lyophilized powder in single-use vials containing 100 mg of the drug.<sup>3145</sup> Each vial also contains mannitol 600 mg, L-threonine 160 mg, polysorbate 80 120 mg, sodium citrate dihydrate 235 mg, and hydrochloric acid 160 mg.<sup>3145</sup>

Vials containing temozolomide should be allowed to reach room temperature prior to reconstitution.<sup>3145</sup> Each 100-mg vial of temozolomide should be reconstituted with 41 mL of sterile water for injection to yield a solution with a final temozolomide concentration of 2.5 mg/mL.<sup>3145</sup> Vials should be gently swirled until the contents are dissolved; vials should not be shaken.<sup>3145</sup> The reconstituted solution should be visually inspected; if particulate matter is visible, the solution should not be used.<sup>3145</sup> Up to 40 mL may be withdrawn from each reconstituted vial and transferred to an empty 250-mL infusion bag to make up the total dose.<sup>3145</sup> The reconstituted solution should *not* be further diluted.<sup>3145</sup>

#### Trade Name(s)

Temodar

#### Administration

Temozolomide is administered only by intravenous infusion over 90 minutes using an infusion pump.<sup>3145</sup> Infusion over a period of time other than 90 minutes may result in suboptimal dosing.<sup>3145</sup>

Temozolomide should be infused through a separate line, or, if a common infusion line is being used to administer other

drugs, the line should be flushed (e.g., with sodium chloride 0.9%) prior to and following infusion of temozolomide.<sup>3145</sup>

As with other toxic drugs, temozolomide should be prepared and administered with care.<sup>3145</sup> Vials of the drug should *not* be opened.<sup>3145</sup> Protective measures (e.g., the use of gloves and eye protection) should be taken to avoid inadvertent contact with or inhalation of the drug in the case of breakage of the vial or other accidental spillage.<sup>3145</sup> Applicable disposal procedures for the drug should be followed.<sup>3145</sup>

#### Stability

Temozolomide is a white to light tan or light pink powder.<sup>3145</sup> Intact vials of temozolomide should be stored at 2 to 8°C.<sup>3145</sup>

The reconstituted solution should be stored at room temperature (i.e., 25°C).<sup>3145</sup> The total time from reconstitution through completion of administration should not exceed 14 hours.<sup>3145</sup>

#### pH Effects

Temozolomide is stable at acidic pH (less than 5) and is alkali labile.<sup>3145</sup>

#### Additional Compatibility Information

##### Infusion Solutions

The manufacturer states that temozolomide solution may be administered in the same intravenous infusion line only with sodium chloride 0.9%.<sup>3145</sup>

# Temsirolimus

## AHFS 10:00

### Products

Temsirolimus is available in a 2-vial kit: the first single-use vial contains temsirolimus concentrate for injection and the second single-use vial contains 1.8 mL of special diluent.<sup>3205</sup> Each vial of temsirolimus concentrate for injection contains temsirolimus 25 mg/mL, dehydrated alcohol 39.5% (w/v), *dl*-alpha-tocopherol 0.075% (w/v), propylene glycol 50.3% (w/v), and anhydrous citric acid 0.0025% (w/v).<sup>3205</sup> Each vial of special diluent contains polysorbate 80 40% (w/v), polyethylene glycol 400 42.8% (w/v), and dehydrated alcohol 19.9% (w/v).<sup>3205</sup> Both the temsirolimus concentrate for injection vial and the accompanying diluent vial contain an overfill.<sup>3205</sup>

Preparation of the final diluted solution for infusion from this 2-vial kit requires a 2-step dilution procedure prior to administration.<sup>3205</sup> Step 1 is the preparation of the *initial* diluted solution, which is then further diluted to the *final* diluted solution for infusion in step 2.<sup>3205</sup> During handling and preparation of temsirolimus admixtures, the drug should be protected from excessive room light and sunlight.<sup>3205</sup>

To prepare the initial diluted solution (step 1), 1.8 mL of the special diluent should be withdrawn from the vial of accompanying diluent and added to the vial of temsirolimus concentrate for injection.<sup>3205</sup> Each vial of diluted temsirolimus concentrate for injection should be mixed well by inverting the vial.<sup>3205</sup> This initial diluted solution is a clear to slightly turbid, colorless to light yellow solution, essentially free from visual particulates, having a temsirolimus concentration of 10 mg/mL (30 mg/3 mL) and an alcohol content of 35.2%.<sup>3205</sup> The vial should be allowed to stand for a sufficient time to allow air bubbles created during mixing to subside.<sup>3205</sup>

To prepare the final diluted solution (step 2), the appropriate dose of the temsirolimus 10-mg/mL initial diluted solution should be withdrawn from the vial and added to a glass or plastic (e.g., polypropylene, polyolefin) container of 250 mL of sodium chloride 0.9%.<sup>3205</sup> The final diluted solution for infusion should be mixed by inversion of the infusion container; excessive shaking should be avoided as it may cause foaming.<sup>3205</sup> Solutions should be visually inspected for particulate matter and discoloration prior to administration.<sup>3205</sup>

### Trade Name(s)

Torisel

### Administration

Temsirolimus is administered as an intravenous infusion over 30 to 60 minutes, preferably using an infusion pump, to patients who have been adequately premedicated to control adverse effects.<sup>3205</sup> To minimize patient exposure to the diethylhexyl phthalate (DEHP) plasticizer, the final diluted solution for infusion should be administered using non-DEHP plasticized non-polyvinyl chloride (non-PVC) (e.g., polyethylene-lined) administration sets containing an appropriate filter.<sup>3205</sup> (See Filtration.) If a PVC administration set must be used, it should not contain DEHP.<sup>3205</sup>

### Stability

Intact vials of temsirolimus concentrate for injection and special diluent contained in the kit should be stored at 2 to 8°C and protected from light.<sup>3205</sup>

Temsirolimus concentrate for injection is a clear, colorless to light yellow solution.<sup>3205</sup> The initial diluted solution is stable for up to 24 hours at temperatures less than 25°C.<sup>3205</sup> Once the initial diluted solution has been further diluted with sodium chloride 0.9% to the final diluted solution for infusion, administration should be completed within 6 hours of preparation of the final diluted solution for infusion.<sup>3205</sup> The final diluted solution for infusion should be protected from excessive room light and sunlight.<sup>3205</sup>

### pH Effects

Temsirolimus is degraded by both acids and bases; combinations of temsirolimus with agents capable of affecting the solution pH should be avoided.<sup>3205</sup>

### Light Effects

Temsirolimus is light sensitive.<sup>3214</sup> Intact vials, as well as the final diluted solution for infusion, should be protected from light.<sup>3205</sup> The drug also should be protected from excessive room light and sunlight during handling and preparation of temsirolimus admixtures.<sup>3205</sup>

Temsirolimus diluted for infusion in polypropylene containers protected from light was infused through a 1.85-m length of non-DEHP PVC-lined intravenous infusion tubing (Intrafix Safe Set, B. Braun) either protected from room light (with aluminum foil) or unprotected over a period of 45 minutes at room temperature.<sup>3214</sup> No substantial degradation of temsirolimus was noted following simulated infusion of the diluted solution through tubing with or without light exposure.<sup>3214</sup>

### Plasticizer Leaching

Polysorbate 80 contained in the temsirolimus initial diluted solution and the final diluted solution for infusion can increase the rate at which plasticizer is leached from DEHP-plasticized PVC containers and administration sets.<sup>3205</sup> The duration of contact of the diluted drug with PVC during preparation and administration of the drug should be considered.<sup>3205</sup> To minimize patient exposure to the plasticizer, the final diluted solution for infusion should be stored in glass or plastic (e.g., polypropylene, polyolefin) containers and infused using polyethylene-lined administration sets.<sup>3205</sup> If a PVC administration set must be used, it should not contain DEHP.<sup>3205</sup>

### Filtration

The manufacturer recommends the use of an inline polyethersulfone filter with a pore size not exceeding 5 µm for administration.<sup>3205</sup> If the available administration set does not contain an inline filter, an endline polyethersulfone filter should be added to the set prior to drug administration.<sup>3205</sup> Different endline filters ranging in pore size from 0.2 to 5 µm may be used; however, the manufacturer does not recommend the use of both an inline and endline filter.<sup>3205</sup>

# Teniposide

**AHFS 10:00****VM-26**

## Products

Teniposide is available in 5-mL ampuls containing 50 mg of drug. Each mL of solution contains teniposide 10 mg, benzyl alcohol 30 mg, *N,N*-dimethylacetamide (DMA) 60 mg, polyoxyethylated castor oil (Cremophor EL) 500 mg, and dehydrated alcohol 42.7% (v/v). The pH is adjusted with maleic acid. The product is a concentrate that must be diluted for use.<sup>1(6/06)</sup>

## pH

Approximately 5.<sup>1(6/06)</sup>

## Trade Name(s)

Vumon

## Administration

Teniposide is administered by slow intravenous infusion over at least 30 to 60 minutes after dilution in dextrose 5% or sodium chloride 0.9% to a final concentration of 0.1, 0.2, 0.4, or 1 mg/mL.<sup>1(6/06)</sup> Extended infusions of 0.1- and 0.2-mg/mL solutions over 24 hours have resulted in precipitation.<sup>1(6/06) 1502 1521</sup> The intravenous solution containers and sets used to administer teniposide should not contain the plasticizer diethylhexyl phthalate (DEHP). Extravasation should be avoided because of local tissue irritation and phlebitis.<sup>1(6/06) 4</sup>

Heparin sodium can cause precipitation of teniposide. Administration apparatus should be thoroughly flushed before and after teniposide administration with dextrose 5% or sodium chloride 0.9%.<sup>1(6/06) 1502</sup>

Contact of the undiluted teniposide concentrate with plastic equipment and devices during preparation has resulted in softening of the plastic, cracking, and leakage. Damage to plastic equipment has not been reported with diluted solutions.<sup>1(6/06)</sup>

## Stability

The teniposide concentrate is clear<sup>1(6/06)</sup> but may exhibit a slight opalescence when diluted in infusion solutions due to the surfactant content.<sup>234</sup>

Intact ampuls should be stored under refrigeration in the original package to protect from light. Teniposide stability is not adversely affected by freezing<sup>1(6/06)</sup> or exposure to normal room fluorescent light during administration.<sup>1374</sup>

The manufacturer does not recommend refrigeration of teniposide diluted in infusion solutions.<sup>1(6/06)</sup>

## Precipitation

Although teniposide is chemically stable for at least 24 hours, precipitation from aqueous solutions has occurred irregularly and unpredictably even at 0.1 and 0.2 mg/mL, the lowest recommended concentrations.<sup>1(6/06) 1502 1521</sup> The precipitation rate depends on the formation of crystallization nuclei. Precipitation

then proceeds rapidly. The formation of crystallization nuclei may be accelerated by agitation, contact with incompatible drugs or material surfaces, and, possibly, other factors.<sup>1374 1502 1521</sup> The manufacturer recommends avoiding an inordinate amount of agitation during preparation, minimizing storage time prior to administration, and avoiding contact with other drugs and solutions. Even the compatibility of teniposide infusions with some infusion set materials and pumps cannot be assured.<sup>1(6/06) 1502 1521</sup>

## Sorption

No teniposide loss due to sorption to polyvinyl chloride (PVC) containers has been observed.<sup>1374 2053</sup>

## Plasticizer Leaching

The surfactant, Cremophor EL, in the teniposide formulation leaches the plasticizer DEHP from PVC containers and sets. The amount leached increases with time and drug concentration and is similar for sodium chloride 0.9% and dextrose 5%. The use of non-PVC containers, such as glass bottles and polyolefin bags, and non-PVC administration sets, such as lipid administration sets and nitroglycerin sets, is recommended.<sup>1(6/06)</sup>

Teniposide (Bristol) 0.1 mg/mL in dextrose 5% leached relatively large amounts of DEHP from PVC bags due to the Cremophor EL surfactant in the formulation. After 8 hours at 24°C, the DEHP concentration in 50-mL bags of infusion solution was as much as 7.5 mcg/mL; it continued to increase through 24 hours to 22.2 mcg/mL. This finding is consistent with the surfactant concentration (1%) of the final admixture solution. The actual amount of DEHP leached from PVC containers and administration sets may vary in clinical situations, depending on surfactant concentration, bag size, and contact time.<sup>1683</sup>

Substantial leaching of DEHP plasticizer was reported from PVC bags of dextrose 5% and sodium chloride 0.9% and PVC administration sets by teniposide admixtures containing 0.4 mg/mL of the drug due to the Cremophor EL surfactant used in the formulation. DEHP levels increased throughout the 1-hour infusion time to over 20 mcg/mL from both the bags and sets. There was no difference in plasticizer leaching between the 2 infusion solutions. Storage of the teniposide 0.4-mg/mL admixtures for 48 hours at both 4 and 24°C resulted in substantially greater DEHP leaching. DEHP concentrations ranged from about 60 mcg/mL in the refrigerated samples to over 200 mcg/mL (a total of 52 mg) in the room temperature samples. The actual amount of DEHP a patient will receive is dependent on a number of factors, including Cremophor EL concentration, storage temperature, and contact time. No plasticizer was leached from glass bottles or polyolefin infusion containers. To minimize plasticizer leaching if PVC containers and sets must be used, it is recommended that teniposide admixtures be used immediately after preparation and administered over no more than 1 hour.<sup>2053</sup>

In 1996, an acceptability limit of no more than 5 parts per million (5 mcg/mL) for DEHP plasticizer released from PVC-containing devices (e.g., containers, administration sets, other equipment) was proposed based on a review of metabolic and toxicologic considerations.<sup>2185</sup> FDA later evaluated the safety of DEHP exposure by comparing doses of DEHP received by patients undergoing various medical procedures with a defined tolerable intake value of DEHP, a value that was based upon the results of selected critical toxicity studies in experimental animals.<sup>3100</sup> Based on the results of the safety assessment, FDA concluded that there is little risk posed by exposure to the amount of DEHP released from PVC bags used to store and administer drugs that require an excipient for solubilization *when label instructions for*

*preparation and administration are followed.*<sup>3100</sup> However, such conclusions do not take into account increased risk for adverse effects from DEHP exposure in certain patients (e.g., critically ill male neonates or infants, male infants less than 1 year of age, male offspring of pregnant or breast-feeding women undergoing certain medical treatments) or potential adverse effects related to aggregate exposure for patients exposed to multiple medical devices, procedures, or intravenous medications known to leach DEHP, for which there are varying levels of concern.<sup>3100 3101</sup>

Teniposide 0.1 mg/mL in dextrose 5% in VISIV polyolefin bags was tested at room temperature near 23°C for 24 hours. No leached plastic components were found within the 24-hour study period.<sup>2660 2792</sup>

## Tenoxicam

AHFS 28:08.04

### Products

Tenoxicam is available as a lyophilized powder for injection in vials containing 20 and 40 mg of drug. Also present in the vials are mannitol, ascorbic acid, disodium edetate, tromethamine, and sodium hydroxide or hydrochloric acid. The lyophilized powder should be reconstituted using the 2-mL ampuls of sterile water for injection provided for that purpose.<sup>38 115</sup>

### Trade Name(s)

Mobiflex, Tilcotil

### Administration

Tenoxicam is administered by intramuscular<sup>38 115</sup> or intravenous bolus injection.<sup>38 115</sup> Addition to infusion solutions is not recommended.<sup>38 115</sup>

### Stability

The greenish-yellow lyophilized powder in intact vials should be stored at controlled room temperature at or below 25°C<sup>38</sup> to 30°C<sup>115</sup> and protected from freezing. The drug is stable for 24 hours after reconstitution, but administration immediately after preparation is recommended. It should not be added to infusion solutions because of the possibility of precipitation.<sup>38 115</sup>

## Terbutaline Sulfate

AHFS 12:12.08.12

### Products

Terbutaline sulfate is available in 1-mL ampuls. Each mL contains terbutaline sulfate 1 mg, sodium chloride for isotonicity, and hydrochloric acid to adjust the pH.<sup>1(3/04) 4</sup>

### pH

The pH is adjusted to 3 to 5.<sup>1(3/04) 4</sup>

### Osmolality

The injection is isotonic.<sup>1(3/04)</sup>

### Administration

Terbutaline sulfate injection is administered subcutaneously only, usually into the lateral deltoid area.<sup>1(3/04) 4</sup> Intravenous administration is not recommended by the manufacturer<sup>1(3/04)</sup> but has been used in selected patients with careful monitoring.<sup>4</sup>

### Stability

Although relatively stable compared to corresponding catecholamines<sup>738</sup>, terbutaline sulfate is nonetheless sensitive to light and excessive heat. The injection should be stored at controlled room temperature and protected from light and freezing.

Discolored solutions should not be used.<sup>1(3/04) 4</sup> Terbutaline sulfate is stated to be stable over the pH range of 1 to 7.<sup>4</sup>

### Syringes

The stability of terbutaline sulfate (Geigy) 1 mg/mL was studied packaged in polypropylene syringes (Becton Dickinson) fitted with luer-tip caps (Becton Dickinson). The samples were stored at 4°C in the dark, 25°C in the dark, and 25°C with exposure to fluorescent light. Samples stored in the dark at both temperatures were stable, exhibiting a 5 to 6% drug loss in 60 days. The 25°C samples exposed to light showed a 5% loss in 28 days and an 11% loss in 60 days with a yellow discoloration.<sup>1298</sup>

The stability of terbutaline sulfate (Geigy) 1 mg/mL repackaged in syringes was evaluated. A 0.25-mL sample was drawn into each plastic tuberculin syringe (Becton Dickinson) and sealed with a luer-tip cap (Becton Dickinson). Samples were stored at 4 and 24°C with exposure to light and light protection. Little difference was reported in the terbutaline sulfate content among the four storage conditions. Drug losses of 5% or less were observed after seven weeks of storage. Although no discoloration was reported, it may not have been observed in the small sample present in the tuberculin syringe.<sup>1299</sup>

# Tetracaine Hydrochloride

AHFS 72:00

## Products

Tetracaine hydrochloride is available as a preservative-free solution in a concentration of 10 mg/mL (1%) in 2-mL ampules. The product also contains sodium chloride and hydrochloric acid and/or sodium hydroxide to adjust pH in water for injection.<sup>1(4/06)</sup>

Pontocaine brand of tetracaine hydrochloride 10 mg/mL also contains acetone sodium bisulfite.<sup>4</sup>

Tetracaine hydrochloride hyperbaric solutions are available in concentrations of 0.2 and 0.3% in dextrose 6%.<sup>4</sup>

## pH

Tetracaine hydrochloride injection has a pH ranging from 3.2 to 6.0.<sup>1(4/06)</sup> Reconstituted tetracaine hydrochloride powder has a pH ranging from 5 to 6 after reconstitution.<sup>4</sup>

## Tonicity

Tetracaine hydrochloride 10-mg/mL injection is isotonic.<sup>1(4/06)</sup>

## Trade Name(s)

Pontocaine Hydrochloride

## Administration

Tetracaine hydrochloride injection is used for prolonged spinal anesthesia. The injection is isobaric having a specific gravity of 1.0060 to 1.0074 at 25°C, which is very similar to spinal fluid. A hyperbaric solution of tetracaine hydrochloride may be prepared by diluting the 10-mg/mL injection in dextrose 10%.<sup>1(4/06)</sup><sup>4</sup>

Tetracaine hydrochloride powder for injection dissolved in spinal fluid is slightly hyperbaric. A hypobaric solution with a specific gravity of 1.000 at 25°C may be prepared by dissolving the tetracaine hydrochloride powder in sterile water for injection at a concentration of 0.1%. A hyperbaric solution of tetracaine hydrochloride may be prepared by dissolving the powder in dextrose 10% to yield a 10-mg/mL solution. The resulting

solution is further diluted with an equal volume of cerebrospinal fluid to yield 5 mg/mL of tetracaine hydrochloride and dextrose.<sup>4</sup>

## Stability

Tetracaine hydrochloride injection in intact vials should be stored under refrigeration and protected from light. Freezing should be avoided. The injection should not be used if crystals, cloudiness, or discoloration is present.<sup>1(4/06)</sup><sup>4</sup>

Tetracaine hydrochloride 10-mg/mL injection and tetracaine hydrochloride powder in intact containers can be autoclaved at 121°C for 15 minutes to sterilize the exterior of the ampuls. However, autoclaving may increase the occurrence of crystal formation. Ampuls that have been autoclaved but are not used must be discarded and may not be returned to stock.<sup>1(4/06)</sup><sup>4</sup>

Tetracaine hydrochloride in aqueous solutions undergoes hydrolysis slowly that results in the formation of *p*-butylamino-benzoic acid crystals. Solutions containing crystals should not be used.<sup>4</sup>

Tetracaine hydrochloride stability in aqueous solution was evaluated. Accelerated degradation at elevated temperatures led to a determination that tetracaine hydrochloride in aqueous solution was stable for at least 12 months at 25°C with about 96% remaining. After two years, the concentration had declined to about 89%.<sup>2453</sup> When stored under refrigeration at 4 to 6°C, no loss of tetracaine hydrochloride was detected after 365 days of storage.<sup>2705</sup>

## pH Effects

Tetracaine hydrochloride is unstable in both acidic and alkaline media. The pH of maximum stability was found to be 3.8.<sup>2666</sup><sup>2705</sup> Tetracaine hydrochloride mixed with alkali hydroxides or carbonates results in the precipitation of tetracaine base as an oily liquid.<sup>4</sup>

# Theophylline

AHFS 86:16

## Products

Theophylline is available in concentrations ranging from 0.8 to 4 mg/mL (expressed as anhydrous theophylline) premixed in dextrose 5%.<sup>1(7/08)</sup>

## pH

From 3.5 to 6.5.<sup>1(7/08)</sup>

## Osmolality

Theophylline premixed in dextrose 5% products have osmolalities in the range of 255 to 275 mOsm/kg.<sup>1(7/08)</sup>

## Administration

Theophylline may be administered by continuous or intermittent intravenous infusion. Slow administration, not exceeding

20 mg/min, has been recommended. Loading doses are usually given over 20 to 30 minutes.<sup>1(7/08)</sup>

## Stability

Theophylline injection should be stored at controlled room temperature and protected from freezing. Avoid excessive heat.<sup>1(7/08)</sup>

At a concentration of 1 g/L in dextrose 5%, theophylline was stable during autoclaving for 20 minutes at 120°C. No decrease in the theophylline content was detected.<sup>1173</sup>

## Thiamine Hydrochloride

AHFS 88:08

### Products

Thiamine hydrochloride is available in a concentration of 100 mg/mL in 1- and 2-mL vials. Each mL of solution may also contain chlorobutanol 0.5% as an antibacterial preservative and monothioglycerol 0.5%. Sodium hydroxide and/or hydrochloric acid may be added to adjust the pH.<sup>1(6/06) 4</sup>

### pH

From 2.5 to 4.5.<sup>1(6/06) 17</sup>

### Administration

Thiamine hydrochloride injection may be administered by intramuscular or slow intravenous injection. An intradermal test dose has been recommended for patients with suspected thiamine sensitivity.<sup>1(6/06) 4</sup>

### Stability

Thiamine hydrochloride in intact containers should be stored at controlled room temperature and protected from light and freezing.<sup>1(6/06) 4</sup>

Thiamine hydrochloride under simulated summer conditions in paramedic vehicles was exposed to temperatures ranging from 26 to 38°C over four weeks. Analysis found no loss of the drug under these conditions.<sup>2562</sup>

Thiamine hydrochloride is stated to be incompatible with oxidizing and reducing agents.<sup>4</sup> In solutions with sulfites or

bisulfites, it is rapidly inactivated.<sup>52 1072 1925</sup> Oxidation of thiamine hydrochloride results in the formation of the highly blue-colored and biologically inactive compound thiochrome.<sup>734 1072</sup>

### pH Effects

Thiamine hydrochloride is stable in acid solutions, losing activity very slowly at pH 4 or less. It is maximally stable at pH 2.<sup>1072</sup> Thiamine hydrochloride is unstable in neutral or alkaline solutions.<sup>1(6/06) 4 1072</sup>

### Syringes

Thiamine hydrochloride (Lilly) 100 mg/mL was repackaged in glass syringes (Glaspak), back-fill glass syringes (Hy-Pod), and plastic syringes (Stylex). Half of the syringes were filled with thiamine hydrochloride injection filtered through 5- $\mu$ m stainless steel depth filters (Extemp filter pin), and the rest were filled with unfiltered drug. The syringes containing 1 mL of thiamine hydrochloride injection were stored protected from light (amber UV-light-inhibiting plastic bags) at 22 to 24°C for 84 days. No color changes were observed, and changes in pH were minimal. Furthermore, no differences between filtered or unfiltered samples occurred, with all solutions retaining approximately 100% over the 84 days.<sup>734</sup>

### Sorption

Thiamine hydrochloride (Merck) 30 mg/L did not display significant sorption to a PVC plastic test strip in 24 hours.<sup>12</sup>

## Additional Compatibility Information

### Parenteral Nutrition Solutions

The stability of thiamine hydrochloride 50 mg/L was studied in representative parenteral nutrition solutions exposed to fluorescent light, indirect sunlight, and direct sunlight for eight hours. One 5-mL vial of multivitamin concentrate (Lyphomed) containing 50 mg of thiamine hydrochloride and also 1 mg of folic acid (Lederle) were added to a liter of parenteral nutrition solution composed of amino acids 4.25%–dextrose 25% (Travenol) with standard electrolytes and trace elements. Thiamine hydrochloride was stable over the eight-hour study period at room temperature under fluorescent light and indirect sunlight, but direct sunlight caused a 26% loss.<sup>842</sup>

A 50% initial drop in thiamine concentration immediately after admixture of multivitamins in a parenteral nutrition solution composed of amino acids, dextrose, electrolytes, and trace elements in PVC bags was reported. The thiamine concentration then remained relatively constant for 120 hours when stored at both 4 and 25°C.<sup>1063</sup>

The stability of numerous vitamins in parenteral nutrition solutions composed of amino acids (Kabi-Vitrum), dextrose 30%, and fat emulsion 20% (Kabi-Vitrum) in a 2:1:1 ratio with electrolytes, trace elements, and both fat- and water-soluble vitamins was reported. The admixtures were stored in darkness at 2 to 8°C for 96 hours with no significant loss of thiamine mononitrate.<sup>1225</sup>

The stability of several vitamins from M.V.I.-12 (Armour) admixed in parenteral nutrition solutions composed of different amino acid products, with or without Intralipid 10%, when stored in glass bottles and PVC bags at 25 and 5°C for 48 hours was reported. Thiamine hydrochloride was stable in the parenteral nutrition solutions prepared with amino acid products without bisulfite.<sup>1431</sup>

The stability of several vitamins following admixture (as M.V.I.-12) with four different amino acid products (Novamine, Neopham, FreAmine III, Travasol) with or without Intralipid when stored in glass bottles or PVC bags at 25°C for 48 hours was reported. Exposure to high intensity phototherapy light did not affect thiamine.<sup>487</sup>

The stability of thiamine hydrochloride from a multiple vitamin product in dextrose 5% and sodium chloride 0.9% in PVC and ClearFlex containers was evaluated. Thiamine hydrochloride was stable at 23°C when exposed to or protected from light, exhibiting losses of 11% or less in 24 hours.<sup>1509</sup>

The degradation of vitamins A, B, C, and E from Cernevit (Roche) multivitamins in NuTRIflex Lipid Plus (B. Braun) admixtures prepared in ethylene vinyl acetate (EVA) bags and in multilayer bags was evaluated. After storage for up to 72

hours at 4, 21, and 40°C, greater vitamin losses occurred in the EVA bags. Thiamine hydrochloride losses were 25%. In the multilayer bags (presumably a better barrier to oxygen transfer), losses were less. Thiamine hydrochloride losses were 10%.<sup>2618</sup>

The vitamins in Cernevit (Baxter) diluted in three 2-in-1 parenteral nutrition admixtures were tested for stability over 48 hours. Most of the other vitamins, including thiamine hydrochloride, retained their initial concentrations.<sup>2796</sup>

## Thiotepa

### AHFS 10:00

#### Products

Thiotepa is available as a lyophilized powder in single-dose vials containing 15 or 100 mg of the drug.<sup>3367</sup> The contents of the 15- or 100-mg vials should be reconstituted with 1.5 or 10 mL, respectively, of sterile water for injection and mixed manually by repeated inversions.<sup>3367</sup> Each mL of the reconstituted solution contains 10 mg of thiotepa.<sup>3367</sup> The reconstituted solution should be diluted in an infusion bag with an appropriate volume of sodium chloride 0.9% (e.g., 500 mL for thiotepa doses of 250 to 500 mg; 1000 mL for thiotepa doses exceeding 500 mg) to achieve a solution with a final thiotepa concentration of 0.5 to 1 mg/mL.<sup>3367</sup>

Thiotepa also is available as a lyophilized powder in single-dose vials labeled as containing 15 mg of the drug.<sup>3368</sup> The vial contents should be reconstituted with 1.5 mL of sterile water for injection.<sup>3368</sup> Vials contain a slight overfill to allow for a withdrawable volume of about 1.4 mL (about 14.7 mg) of the reconstituted solution with an approximate concentration of 10.4 mg/mL.<sup>3368</sup> The appropriate dose of the reconstituted solution should be diluted with sodium chloride 0.9% prior to administration.<sup>3368</sup>

#### pH

The pH of the reconstituted solution of thiotepa has a range of approximately 5.5 to 7.5.<sup>3367 3368</sup>

#### Tonicity

Reconstitution with sterile water for injection results in a hypotonic solution; the reconstituted solution should be diluted in sodium chloride 0.9% prior to use.<sup>3367 3368</sup>

Solutions of thiotepa at concentrations of 0.5 and 1 mg/mL in sodium chloride 0.9% are nearly isotonic; solutions of thiotepa at concentrations of 3 and 5 mg/mL in sodium chloride 0.9% are hypotonic.<sup>2006</sup>

#### Osmolality

The osmolalities of thiotepa 0.5 and 1 mg/mL in sodium chloride 0.9% are 277 and 269 mOsm/kg, respectively.<sup>2006</sup>

#### Trade Name(s)

Tepadina

#### Administration

Thiotepa is administered by rapid intravenous administration or intravenous infusion or by the intracavitary or intravesical route.<sup>3367 3368</sup>

The final diluted solution of thiotepa must be filtered prior to administration.<sup>3367 3368</sup> (See Filtration.)

As with other toxic drugs, caution should be exercised in the handling and preparation of thiotepa.<sup>3367 3368</sup> The use of gloves

has been recommended as skin reactions may occur with accidental exposure.<sup>3368</sup> If skin contact with the solution occurs, the exposed area(s) should be washed thoroughly with soap and water; for mucosal membrane contact, the exposed area(s) should be flushed thoroughly with water.<sup>3367 3368</sup> Procedures for the proper disposal of thiotepa should be considered.<sup>3367</sup>

#### Stability

Thiotepa is a white powder that forms a clear solution upon reconstitution.<sup>3367</sup> One manufacturer notes that reconstituted solutions free of particulate matter may exhibit opalescence; however, such solutions still may be diluted for administration.<sup>3367</sup>

Intact vials should be stored at 2 to 8°C.<sup>3367 3368</sup> One manufacturer (West-Ward) states that thiotepa should be protected from light at all times.<sup>3368</sup> Another manufacturer (Amneal Biosciences) states that thiotepa should not be frozen.<sup>3367</sup>

The reconstituted solution of thiotepa is stable at 2 to 8°C for 8 hours.<sup>3367 3368</sup> Diluted solutions for infusion should be used immediately;<sup>3367 3368</sup> however, one manufacturer has stated that diluted solutions for infusion are stable for 24 hours at 2 to 8°C or 4 hours at 25°C.<sup>3367</sup>

Thiotepa may undergo polymerization forming insoluble derivatives.<sup>1369</sup> Solutions should be visually inspected for particulate matter and discoloration prior to administration; diluted solutions should be used only if free of visible particulate matter.<sup>3367 3368</sup>

Thiotepa is stable in alkaline media, but unstable in acidic media,<sup>3367 3368</sup> undergoing increased rates of hydrolysis.<sup>1389</sup>

#### Syringes

Thiotepa reconstituted to a concentration of 10 mg/mL with sterile water for injection was found to be stable for 24 hours under refrigeration at 8°C and at room temperature of 23°C in both the original vials and transferred to plastic syringes.<sup>2006</sup>

#### Filtration

One manufacturer of thiotepa (Tepadina, Amneal Biosciences) recommends filtration of the diluted solution for infusion through an infusion set containing a 0.2- $\mu$ m inline filter.<sup>3367</sup> Another manufacturer of thiotepa (West-Ward) recommends filtration of the diluted solution for infusion through a 0.22- $\mu$ m filter (i.e., polysulfone membrane [Sterile Aerodisc, Gelman] or triton-free mixed ester of cellulose/polyvinyl chloride [PVC] [Millex-GS, Millipore]) to eliminate haze; solutions that remain opaque or precipitate after such filtration should not be used.<sup>3368</sup> Filtration of thiotepa does not alter potency.<sup>3367 3368</sup>

Thiotepa 10 to 300 mcg/mL exhibited no loss due to sorption to either cellulose nitrate/cellulose acetate ester (Millex OR) or Teflon (Millex FG) filters.<sup>1415 1416</sup>

## Tigecycline

AHFS 8:12.24.12

### Products

Several different formulations of tigecycline are available and excipients vary among them.<sup>2915 3459 3460</sup> Some formulation differences have been demonstrated to result in some differing compatibilities.<sup>2951 3459 3460</sup>

Tigecycline is available as a 50-mg orange lyophilized powder or cake in single-dose (unpreserved) vials containing lactose monohydrate 100 mg (Tygacil, Wyeth),<sup>2915</sup> maltose monohydrate 100 mg (Accord),<sup>3459</sup> or arginine 82.6 mg (Fresenius Kabi).<sup>3460</sup> In each formulation, the pH is adjusted with hydrochloric acid and, if necessary, sodium hydroxide.<sup>2915 3459 3460</sup>

Each 50-mg vial should be reconstituted with 5.3 mL of sodium chloride 0.9%; dextrose 5%; or Ringer's injection, lactated.<sup>2915 3459 3460</sup> The vials contain an excess of drug, and this reconstitution volume yields a reconstituted solution with a tigecycline concentration of 10 mg/mL.<sup>2915 3459 3460</sup> Vials should be swirled gently until the drug has dissolved.<sup>2915 3459 3460</sup> The reconstituted solution must be further diluted prior to administration.<sup>2915 3459 3460</sup> The appropriate volume of the reconstituted solution should be withdrawn from the vial(s) and transferred to a 100-mL infusion bag of sodium chloride 0.9%; dextrose 5%; or Ringer's injection, lactated to yield a solution for infusion with a maximum tigecycline concentration of 1 mg/mL.<sup>2915 3459 3460</sup> The reconstituted solution should be yellow to orange; the solution should be discarded if it does not have the correct color.<sup>2915 3459 3460</sup>

Ringer's injection, lactated		ACD, FRK, WY		Stated to be compatible	2915, 3459, 3460	C
Sodium chloride 0.9%		ACD, FRK, WY	0.5 and 1 g	Stable for up to 48 hr at 2 to 8°C	2915, 3459, 3460	C

### Administration

Tigecycline is administered by intravenous infusion over 30 to 60 minutes only after dilution of the reconstituted solution.<sup>2915 3459 3460</sup>

The diluted solution for infusion may be administered through a dedicated intravenous line or through a Y-site.<sup>2915 3459 3460</sup> If a common infusion line is being used to administer other drugs in addition to tigecycline, the manufacturer states that the line should be flushed prior to and following infusion of tigecycline with sodium chloride 0.9%; dextrose 5%; or Ringer's injection, lactated.<sup>2915 3459 3460</sup> The solution used for flushing should be compatible both with tigecycline and with any other drug administered via the line.<sup>2915 3459 3460</sup>

### Stability

Intact vials of tigecycline should be stored at controlled room temperature.<sup>2915 3459 3460</sup> The reconstituted solution of tigecycline may be stored at room temperature (not exceeding 25°C) for up to 24 hours (up to 6 hours as the reconstituted solution in the vial with the remaining time in the infusion bag).<sup>2915 3459 3460</sup> If storage conditions after reconstitution exceed 25°C, the drug should be diluted as directed and used immediately.<sup>2915 3459 3460</sup> If further diluted immediately after reconstitution, a solution diluted for infusion in sodium chloride 0.9% or dextrose 5% may be stored for up to 48 hours at 2 to 8°C.<sup>2915 3459 3460</sup>

The reconstituted solution should be yellow to orange; solutions should be inspected for particulate matter and discoloration (e.g., the formation of a green or black discoloration).<sup>2915 3459 3460</sup> Discolored solutions should be discarded.<sup>2915 3459 3460</sup>

<sup>k</sup> Salt not specified.

**Additional Compatibility Information****Peritoneal Dialysis Solutions**

Tigecycline (Pfizer) was evaluated for stability in Dianeal PD-4 with dextrose 1.5% (Baxter) and Extraneal with icodextrin 7.5% (Baxter) at a concentration of 2 mg/L with bags stored at 4, 25, and 37°C.<sup>3195</sup> The drug also was evaluated for stability in 2-compartment pH-neutral Balance with dextrose 1.5% (Fresenius).<sup>3195</sup> Bags of 2-compartment pH-neutral Balance with dextrose 1.5% contained tigecycline 4 mg/L in the non-dextrose (i.e., buffer solution) compartment for storage at 4 and 25°C; for bags intended for storage at

37°C, the initial concentration of tigecycline in the non-dextrose compartment also was 4 mg/L; however, the 2 compartments were combined immediately prior to storage at 37°C for a final tigecycline concentration of 2 mg/L.<sup>3195</sup> No color change or precipitation was noted on visual assessment and no meaningful pH changes occurred.<sup>3195</sup> In Dianeal PD-4 with dextrose 1.5% and Extraneal with icodextrin 7.5%, tigecycline loss was 5 and 4%, respectively, in 14 days at 4°C; 7 and 9%, respectively, in 3 days at 25°C; and 4 and 4%, respectively, in 12 hours at 37°C.<sup>3195</sup> In pH-neutral Balance with dextrose 1.5%, tigecycline loss was 6% in 7 days at 4°C, 8% in 3 days at 25°C, and 6% in 8 hours at 37°C.<sup>3195</sup>

# Tirofiban Hydrochloride

AHFS 20:12.18

## Products

Tirofiban hydrochloride is available premixed as a ready-to-use solution for infusion in 100- and 250-mL (IntraVia) plastic containers. Each mL of the ready-to-use infusion provides tirofiban 0.05 mg (50 mcg) as the hydrochloride monohydrate along with sodium chloride 9 mg, sodium citrate dihydrate 0.54 mg, citric acid anhydrous 0.032 mg, and sodium hydroxide and/or hydrochloric acid to adjust pH in water for injection.<sup>1(10/07)</sup>

## pH

From 5.5 to 6.5.<sup>1(10/07)</sup>

## Osmolality

The osmolality of tirofiban hydrochloride premixed infusion solution is approximately 300 mOsm/kg.<sup>4</sup>

## Trade Name(s)

Aggrastat

## Administration

Tirofiban hydrochloride is administered only by intravenous infusion. The premixed infusion solution is ready to use and does not require dilution.<sup>1(10/07)</sup>

## Stability

Tirofiban hydrochloride ready-to-use infusion is clear and colorless. Intact plastic containers should be stored at controlled room temperature of 25°C, with temperature excursions in the range of 15 to 30°C permitted, and protected from light and freezing.<sup>1(10/07)</sup>

## Tobramycin Sulfate

### AHFS 8:12.02

#### Products

Tobramycin sulfate is available in a concentration equivalent to tobramycin base 40 mg/mL in 2-mL vials as well as 50-mL bulk vials. It is also available as a pediatric injection containing tobramycin sulfate equivalent to tobramycin base 10 mg/mL in 2-, 6-, and 8-mL vials. In addition to tobramycin sulfate, other components may be present in the formulations including varying amounts of sodium metabisulfite, and disodium edetate 0.1 mg in water for injection. Phenol 5 mg is present in some formulations. Sodium hydroxide and/or sulfuric acid may have been added during manufacture for pH adjustment.<sup>1(9/08)</sup>

Tobramycin sulfate is also available premixed in sodium chloride 0.9% in 0.8-mg/mL (80 mg) and 1.2-mg/mL (60 mg) concentrations.<sup>4</sup>

Tobramycin sulfate is also available in a pharmacy bulk package as a dry powder in vials containing the equivalent of tobramycin 1.2 g.<sup>1(9/08)</sup> The vial contents should be diluted with 30 mL of sterile water for injection to yield a 40-mg/mL solution. The reconstituted solution is intended to be diluted in a suitable intravenous infusion solution for administration.<sup>4</sup>

#### pH

The pH of the injection is adjusted to 3 to 6.5.<sup>1(9/08)</sup>

#### Osmolality

The osmolality of tobramycin sulfate 10 mg/mL was 133 mOsm/kg by freezing-point depression and 213 mOsm/kg by vapor pressure.<sup>1071</sup>

The osmolality of tobramycin sulfate 1 mg/mL was 254 mOsm/kg in dextrose 5% and 288 mOsm/kg in sodium chloride 0.9%. At 2.5 mg/mL, the osmolality was 261 mOsm/kg in dextrose 5% and 283 mOsm/kg in sodium chloride 0.9%.<sup>1375</sup>

The osmolality of tobramycin sulfate 80 mg was calculated for the following dilutions:<sup>1054</sup>

Diluent	Osmolality (mOsm/kg)	
	50 mL	100 mL
Dextrose 5%	289	285
Sodium chloride 0.9%	319	315

#### Osmolarity

The premixed products in sodium chloride 0.9% have an osmolality of approximately 316 mOsm/kg.<sup>4</sup>

#### Sodium Content

The premixed products contain about 15.4 mEq of sodium per 100 mL of solution.<sup>4</sup>

#### Administration

Tobramycin sulfate may be administered by intramuscular injection or intermittent intravenous infusion. Intramuscular

doses should be withdrawn only from multiple-dose vials; alternatively, the commercial prefilled syringes may be used. When given by intravenous infusion, the dose should be added to 50 to 100 mL of infusion solution and administered over 20 to 60 minutes. In children, the volume should be proportionately less but should allow an infusion period of 20 to 60 minutes. Infusion periods should not be less than 20 minutes; such shorter periods could result in excessive peak serum concentrations.<sup>1(9/08) 4</sup>

#### Stability

Tobramycin sulfate is stable at room temperature. Intact containers should be stored at controlled room temperature between 15 and 30°C; premixed infusion solutions may be stored at temperatures up to 25°C. Freezing and excessive temperatures above 40°C should be avoided. The injections should not be used if they are discolored. The manufacturer recommends use of the 40-mg/mL reconstituted solution within 24 hours when stored at room temperature or 96 hours if refrigerated.<sup>1(9/08) 4</sup> Tobramycin sulfate is stable for several weeks at pH 1 to 11 at temperatures from 5 to 27°C. It can be autoclaved without loss.<sup>145</sup>

#### Freezing Solutions

Tobramycin sulfate reconstituted to a concentration of 40 mg/mL and immediately frozen in the original container is stable for up to 12 weeks when stored at -10 to -20°C.<sup>4</sup>

Tobramycin sulfate (Lilly) 160 mg/50 mL of dextrose 5% in polyvinyl chloride (PVC) bags frozen at -20°C for 30 days and then thawed by exposure to ambient temperature or microwave radiation was evaluated. The solutions showed no evidence of precipitation or color change and showed 6% or less loss. Subsequent storage of the admixture at room temperature for 24 hours also yielded a physically compatible solution which exhibited little or no additional loss.<sup>555</sup>

Tobramycin sulfate (Dista) 120 mg/50 mL in dextrose 5% and sodium chloride 0.9% in PVC bags lost 9% activity in 28 days when frozen at -20°C.<sup>981</sup>

Minibags of tobramycin sulfate in dextrose 5% or sodium chloride 0.9%, frozen at -20°C for up to 35 days, were thawed at room temperature and in a microwave oven, with care taken that the thawed solution temperature never exceeded 25°C. No significant differences in tobramycin sulfate concentrations occurred between the 2 thawing methods.<sup>1192</sup>

#### Syringes

Samples of a 40-mg/mL solution of tobramycin sulfate (Lilly) from a reconstituted 1.2-g vial were stored in Monoject plastic syringes at both 25 and 4°C. After 2 months, no significant change in concentration was detected in samples at either storage temperature. The authors did note that the manufacturer does not recommend storage in plastic syringes because of possible incompatibility with the plunger heads.<sup>736</sup>

Tobramycin sulfate (Dista) 120 mg diluted with 1 mL of sodium chloride 0.9% to a final volume of 4 mL was stable (less than a 10% loss) when stored in polypropylene syringes (Becton Dickinson) for 48 hours at 25°C under fluorescent light.<sup>1159</sup>

**Elastomeric Reservoir Pumps**

Tobramycin sulfate (Lilly) 0.8 mg/mL in both dextrose 5% and sodium chloride 0.9% was evaluated for binding potential to natural rubber elastomeric reservoirs (Baxter). No binding was found after storage for 2 weeks at 35°C with gentle agitation.<sup>2014</sup>

**Sorption**

Tobramycin sulfate was shown not to exhibit sorption to PVC bags and tubing, polyethylene tubing, Silastic tubing, and polypropylene syringes.<sup>536 606</sup>

Tobramycin sulfate (Qualimed) 1.5 mg/mL in dextrose 5% and in sodium chloride 0.9% was packaged in PVC bags (MacroPharma) and in multilayer bags composed of polyethylene, polyamide, and polypropylene (Bieffe Medital). The solutions were delivered through PVC administration sets (Abbott) over 1 hour and evaluated for drug loss. No loss due to sorption to any of the plastic materials was found.<sup>2269</sup>

**Filtration**

Tobramycin sulfate (Lilly) 0.3 mg/mL in dextrose 5% and sodium chloride 0.9% was filtered through a 0.22-µm cellu-

lose ester membrane filter (Ivex-HP, Millipore) over 6 hours. No significant drug loss due to binding to the filter was noted.<sup>1034</sup>

Tobramycin sulfate 5 and 10 mg/55 mL in dextrose 5% and sodium chloride 0.9% filtered over 20 minutes through a 0.22-µm cellulose ester filter set (Ivex-2, Millipore) was evaluated. Little or no binding of the drug to the filter occurred.<sup>1003</sup>

No significant loss due to sorption to a 0.22-µm cellulose ester filter (Continu-Flo 2C0252s, Travenol) occurred from a solution containing tobramycin sulfate (Dista) 80 mg/100 mL of dextrose 5% administered over 30 minutes. No difference in drug recovery was found between filtered and unfiltered solutions. However, 10% or more of the solution may remain in the tubing unless the sets are flushed.<sup>1132</sup>

**Central Venous Catheter**

Tobramycin sulfate (Lilly) 1 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

<sup>x</sup> Ceftazidime component. Ceftazidime in a 4:1 fixed-ratio concentration with avibactam.

<sup>y</sup> Tested in both dextrose 5% and Ringer's injection, lactated.

<sup>z</sup> Salt not specified.

**Additional Compatibility Information****Peritoneal Dialysis Solutions**

Tobramycin base (Lilly) 3 and 10 mg/L in peritoneal dialysis concentrate with dextrose 50% (McGaw) retained about 50 to 60% of initial activity in 7 hours and about 15 to 30% in 24 hours at room temperature.<sup>1044</sup>

The stability of tobramycin sulfate (Lilly) 10 mg/L in peritoneal dialysis solutions (Dianeal 137 and PD-2) with heparin sodium 500 units/L was evaluated. Approximately 102 ± 20% activity remained after 24 hours at 25°C.<sup>1228</sup>

In another study, the stability of tobramycin sulfate (Lilly) was evaluated in peritoneal dialysis concentrates containing dextrose 30 and 50% (Dianeal) as well as in a diluted solution containing dextrose 2.5%. The tobramycin sulfate concentrations were 100 and 160 mg/L in the peritoneal dialysate concentrates

and 5 and 8 mg/L in the diluted solution. Tobramycin sulfate was found to be stable in the diluted peritoneal dialysis solution for at least 24 hours at 23°C. However, greater decomposition occurred in the concentrates, with a 10% loss in as little as 9 to 15 hours.<sup>1229</sup>

The retention of antimicrobial activity of tobramycin sulfate (Lilly) 120 mg/L alone and with vancomycin hydrochloride (Lilly) 1 g/L was evaluated in Dianeal PD-2 (Travenol) with dextrose 1.5%. Little or no loss of either antibiotic occurred in 8 hours at 37°C. Tobramycin sulfate alone retained activity for at least 48 hours at 4 and 25°C. With vancomycin hydrochloride, the activity of both antibiotics was retained for up to 48 hours; however, the authors recommended refrigeration at 4°C for storage longer than 24 hours.<sup>1414</sup>

Ceftazidime (Fortaz) 125 mg/L and tobramycin sulfate (Lilly) 8 mg/L in Dianeal PD-2 with dextrose 2.5% (Baxter) were visually

compatible and chemically stable. After 16 hours of storage at 25°C under fluorescent light, the loss of both drugs was less than 3%. Additional storage for 8 hours at 37°C, to simulate the maximum peritoneal dwell time, showed tobramycin sulfate concentrations of 96% and ceftazidime concentrations of 92 to 96%.<sup>1652</sup>

Tobramycin sulfate (Lilly) 25 mcg/mL combined separately with the cephalosporins cefazolin sodium (Lilly) and cefoxitin (MSD) at a concentration of 125 mcg/mL in peritoneal dialysis solution (Dianeal 1.5%) exhibited enhanced rates of lethality to *Staphylococcus aureus*, *Escherichia coli*, and *Pseudomonas aeruginosa* compared to any of the drugs alone.<sup>1623</sup>

### ***β-Lactam Antibiotics***

In common with other aminoglycoside antibiotics, tobramycin sulfate activity may be impaired by the β-lactam antibiotics. The

inactivation is dependent on concentration, temperature, and time of exposure.<sup>68 497 498 574 575 654 740 814 816 817 832 824 973 1005 1052 1420</sup>

The clinical significance of these interactions appears to be primarily confined to patients with renal failure.<sup>218 334 361 364 616 737 816 847 952</sup> Literature reports of greatly reduced aminoglycoside levels in such patients have appeared frequently.<sup>363 365 366 367 614 666 962</sup> In addition, the interaction may be clinically important if assays for aminoglycoside levels in serum are sufficiently delayed.<sup>576 618 735 824 832 847 1052</sup>

Most authors believe that in vitro mixing of penicillins with aminoglycoside antibiotics should be avoided but that clinical use of the drugs in combination can be of great value. It is generally recommended that the drugs be given separately in such combined therapy.<sup>157 218 222 224 361 364 368 369 370</sup>

# Topotecan Hydrochloride

**AHFS 10:00**

## Products

Topotecan hydrochloride is available in vials containing 4 mg of topotecan base (present as the hydrochloride) as a lyophilized powder. Reconstitute with 4 mL of sterile water for injection to yield a 1-mg/mL topotecan solution. In addition to topotecan hydrochloride, each mL of the reconstituted solution contains mannitol 12 mg and tartaric acid 5 mg. Hydrochloric acid and sodium hydroxide may have been used during manufacture to adjust the pH. The reconstituted solution must be diluted for use.<sup>1(10/07)</sup>

## pH

From 2.5 to 3.5.<sup>1(10/07)</sup>

## Trade Name(s)

Hycamtin

## Administration

Topotecan hydrochloride is administered by intravenous infusion over 30 minutes after dilution in 50 to 250 mL of either sodium chloride 0.9% or dextrose 5%. Extravasation should be avoided; local reactions including erythema and bruising may result.<sup>1(10/07)</sup> 4

As for other toxic drugs, topotecan hydrochloride should be prepared and administered using protective measures to avoid inadvertent contact with the drug. The use of gloves, protective clothing, and vertical laminar flow hoods or biological safety cabinets is recommended. If skin contact with the drug does occur, wash the area thoroughly with soap and water. For mucous membrane contact, flush thoroughly with water. Disposal should also be performed safely to avoid inadvertent exposure.<sup>1(10/07)</sup> 4

## Stability

Topotecan hydrochloride in intact vials should be stored in the original cartons at controlled room temperature and protected from light. The lyophilized drug is a light yellow to greenish powder. The reconstituted solution is yellow to yellow-green in color.<sup>1(10/07)</sup> The reconstituted solution should be inspected for particulate matter in the vial and again in the transferring syringe prior to preparing admixtures. As for all parenteral products, the admixtures should also be inspected for particulate matter and discoloration prior to administration.<sup>4</sup>

Reconstituted topotecan hydrochloride is stated to be stable for 24 hours at 20 to 25°C exposed to ambient light.<sup>4</sup> However, the manufacturer recommends use immediately after reconstitution because the product contains no antibacterial preservative.<sup>1(10/07)</sup>

Other information indicates the reconstituted drug may be stable for longer periods. Vials of reconstituted topotecan hydrochloride at a concentration of 1 mg/mL were stored at 5, 25, and 30°C both upright and inverted for 28 days. The solutions remained visually clear with no change in color, and little or no loss of topotecan hydrochloride occurred at any condition.<sup>2211</sup>

Topotecan hydrochloride 1 mg/mL reconstituted with sterile water for injection was physically and chemically stable for 28 days at 4 and 25°C protected from light. No loss of topotecan was found, and no visible precipitation or color change occurred.<sup>2243</sup>

Whether any antimicrobial effect of topotecan hydrochloride exists is uncertain but could be concentration dependent. Two studies that have been performed seem to have different results, perhaps due to the very different topotecan hydrochloride concentrations being tested.

Topotecan hydrochloride 0.01 mg/mL diluted in sodium chloride 0.9% and stored at 22°C did not exhibit an antimicrobial effect on the growth of 4 organisms (*Enterococcus faecium*, *Staphylococcus aureus*, *Pseudomonas aeruginosa*, and *Candida albicans*) inoculated into the solution. The author recommended that diluted solutions of topotecan hydrochloride be stored under refrigeration whenever possible and that the potential for microbiological growth be considered when assigning expiration periods.<sup>2160</sup>

Topotecan hydrochloride 1 mg/mL reconstituted with sterile water did not support the growth of 5 organisms inoculated into the solution. The USP Preservative Effectiveness Test found that *Pseudomonas aeruginosa*, *Staphylococcus aureus*, and *Escherichia coli* were not viable after 16 hours, 24 hours, and 28 days, respectively. *Candida albicans* and *Aspergillus niger* did not lose viability but did not exhibit growth during the test.<sup>2211</sup>

## pH Effects

Topotecan hydrochloride has a pH near 3 maintained with tartaric acid to ensure adequate solubility of greater than 2.5 mg/mL. The solubility decreases as the pH increases, becoming virtually insoluble at pH 4.5.<sup>1747</sup> Hydrolysis of the topotecan hydrochloride lactone ring is known to occur at pH values above 4.<sup>2140</sup>

## Torsemide

AHFS 40:28.08

### Products

Torsemide is available in 2- and 5-mL single-use vials.<sup>3010</sup> Each mL of solution contains torsemide 10 mg along with polyethylene glycol 400, tromethamine, water for injection, and sodium hydroxide if needed to adjust the pH during manufacture.<sup>3010</sup>

### pH

Above 8.3.<sup>3010</sup>

### Administration

Torsemide is administered intravenously either slowly as a bolus over 2 minutes or as a continuous infusion.<sup>3010</sup> If a

common intravenous line is being used to administer other drugs in addition to torsemide, the line should be flushed with sodium chloride 0.9% prior to and following administration of torsemide.<sup>3010</sup>

### Stability

Intact vials of torsemide should be stored at controlled room temperature and protected from freezing.<sup>3010</sup>

Torsemide injection solution should be visually inspected for discoloration and particulate matter prior to infusion; if either is present, the solution should not be used.<sup>3010</sup>

## Trabectedin

### AHFS 10:00

### Products

Trabectedin is available as a lyophilized powder in single-use vials containing 1 mg of the drug.<sup>3177</sup> Each vial also contains potassium dihydrogen phosphate 27.2 mg, sucrose 400 mg, and phosphoric acid and potassium hydroxide to adjust the pH.<sup>3177</sup> Each vial should be reconstituted with 20 mL of sterile water for injection to yield a solution containing trabectedin 0.05 mg/mL.<sup>3177</sup> Vials should be shaken until the powder has completely dissolved.<sup>3177</sup> The reconstituted solution should be visually inspected for particulate matter and discoloration prior to dilution; if particulate matter is present or discoloration occurs, the solution should not be used.<sup>3177</sup> The appropriate dose of the reconstituted solution should be withdrawn from the vial immediately after reconstitution and diluted in 500 mL of sodium chloride 0.9% or dextrose 5%.<sup>3177</sup>

### pH

The reconstituted solution of trabectedin has a pH from 3.6 to 4.2.<sup>3177</sup>

### Trade Name(s)

Yondelis

### Administration

Trabectedin is administered as an intravenous infusion over 24 hours through a central venous line following dilution of the reconstituted solution in 500 mL of sodium chloride 0.9% or dextrose 5%.<sup>3177</sup> Trabectedin should be administered using an infusion set with a 0.2- $\mu$ m polyethersulfone inline filter.<sup>3177</sup>

As with other toxic drugs, applicable special handling and disposal procedures for trabectedin should be followed.<sup>3177</sup>

Extravasation of trabectedin resulting in tissue necrosis and requiring debridement may occur; trabectedin should be administered through a central venous line.<sup>3177</sup>

### Stability

Trabectedin is a white to off-white powder or cake that forms a clear, colorless to pale brownish-yellow solution when reconstituted with sterile water for injection.<sup>3177</sup> Intact vials should be stored under refrigeration at 2 to 8°C.<sup>3177</sup>

The reconstituted solution should be diluted immediately following reconstitution.<sup>3177</sup> Both the reconstituted solution and the drug diluted for infusion were found to be physically compatible and chemically stable for up to 30 hours when stored at room temperature in ambient light or under refrigeration.<sup>3178</sup> The total time from reconstitution and dilution through completion of administration should not exceed 30 hours; any unused portion of the reconstituted solution or the drug diluted for infusion should be discarded after that time.<sup>3177</sup>

### Sorption

Trabectedin diluted for infusion is noted to be compatible with Type I colorless glass vials; polyvinylchloride (PVC) and polyethylene bags and tubing; polyethylene and polypropylene mixture bags; polyethersulfone inline filters; titanium, platinum, or plastic ports; silicone and polyurethane catheters; and pumps having contact surfaces made of PVC, polyethylene, or a combination of polyethylene and polypropylene.<sup>3177</sup>

### Filtration

The diluted solution for infusion should be administered through an infusion set with a 0.2- $\mu$ m polyethersulfone inline filter.<sup>3177</sup>

## Tramadol Hydrochloride

AHFS 28:08.08

### Products

Tramadol hydrochloride is available as a 50-mg/mL aqueous solution in 1- and 2-mL (50- and 100-mg) ampuls. Sodium acetate and water for injection are also present in the formulation.<sup>38 115</sup>

### Trade Name(s)

Contramal, Topalgic, Tramal, Zamadol, Zydol

### Administration

Tramadol hydrochloride is administered intramuscularly, by direct intravenous injection slowly over 2 to 3 minutes, or by intravenous infusion after dilution.<sup>38 115</sup>

### Stability

Tramadol hydrochloride is a clear, colorless solution. The intact ampuls should be stored below 30°C.<sup>38 115</sup>

Exposure to or protection from light did not affect the stability of tramadol hydrochloride 0.5- and 4-mg/mL infusion solutions in dextrose 5% or sodium chloride 0.9%.<sup>434</sup>

### Freezing Solutions

Tramadol hydrochloride (Searle) 1 mg/mL in dextrose 5% in polyvinyl chloride (PVC) bags was stored frozen at -20°C for 120 days, microwave thawed, and stored refrigerated at 4°C for 60 days. No visual changes and 5% loss of tramadol hydrochloride was found.<sup>2450 2526</sup>

## Tranexamic Acid

AHFS 20:28.16

### Products

Tranexamic acid is available in 10-mL ampuls and vials.<sup>2886 2888</sup> Each mL contains 100 mg tranexamic acid in water for injection.<sup>2886 2888</sup>

### pH

From 6.5 to 8.<sup>2886 2888</sup>

### Trade Name(s)

Cyklokapron

### Administration

The manufacturer recommends that tranexamic acid be administered by slow intravenous injection at a rate that does not exceed 100 mg/min.<sup>2886 2888</sup>

The drug also has been administered as a loading dose infused over 10 minutes, followed by an infusion administered over 8 hours.<sup>2889 2890 2891</sup>

### Stability

Intact vials and ampuls should be stored at controlled room temperature<sup>2886 2888</sup> and protected from light and freezing.<sup>2887</sup>

The solution does not contain any preservative and is for single use.<sup>2887 2888</sup> Any unused product should be discarded.<sup>2887</sup>

The manufacturer recommends that solutions for infusion be prepared on the same day that they are to be used.<sup>2886 2888</sup>

In one study, antifibrinolytic activity of tranexamic acid was retained after ampuls were stored at temperatures ranging from -20 to 50°C for up to 12 weeks; however, all ampuls stored at -20°C were visibly cracked within 1 week.<sup>2988</sup>

## Trastuzumab

### AHFS 10:00

### Products

Trastuzumab is available as a lyophilized powder in multiple-use vials containing 440 mg of the drug with  $\alpha,\alpha$ -trehalose dihydrate 400 mg, L-histidine hydrochloride 9.9 mg, L-histidine 6.4 mg, and polysorbate 20 1.8 mg; the vial is sealed under a vacuum.<sup>3086</sup> Each vial of trastuzumab is packaged with a 20-mL vial of bacteriostatic water for injection diluent containing benzyl alcohol 1.1% as a preservative.<sup>3086</sup>

**CAUTION: Care should be taken to ensure that the correct drug product is prepared and that no confusion with other products (e.g., ado-trastuzumab emtansine) occurs.**<sup>3086</sup> Each vial of trastuzumab should be reconstituted with 20 mL of the provided bacteriostatic water for injection to yield a multiple-use solution containing trastuzumab 21 mg/mL.<sup>3086</sup> The drug also may be reconstituted with 20 mL of sterile water for injection (without preservative) to yield a single-use solution containing trastuzumab 21 mg/mL.<sup>3086</sup> The diluent should be slowly injected into the vial, directing the stream of diluent into the lyophilized cake.<sup>3086</sup> The vial should be swirled gently to aid reconstitution; shaking should be avoided.<sup>3086</sup> The vial should be allowed to stand undisturbed for approximately 5 minutes as slight foaming of the product may occur upon reconstitution.<sup>3086</sup> The reconstituted solution should be visually inspected for particulate matter and discoloration; the solution should be free of visible particulates.<sup>3086</sup>

The appropriate dose of the reconstituted solution should be diluted in 250 mL of sodium chloride 0.9% in a polyvinyl chloride (PVC) or polyethylene bag;<sup>3086</sup> dextrose 5% should *not* be used due to the potential risk of protein aggregation.<sup>3086 3088</sup> The infusion bag should be gently inverted to mix the diluted solution.<sup>3086</sup>

### pH

The pH of the reconstituted solution is approximately 6.<sup>3086</sup>

### Trade Name(s)

Herceptin

### Administration

**CAUTION: Care should be taken to ensure that the correct drug product is administered and that no confusion with other products (e.g., ado-trastuzumab emtansine) occurs.**<sup>3086</sup> Trastuzumab is administered only by intravenous infusion following reconstitution and further dilution in 250 mL of sodium chloride

0.9%.<sup>3086</sup> The drug should be infused over 30 to 90 minutes depending upon previous trastuzumab exposure and the indication for the drug in the specific patient.<sup>3086</sup> Trastuzumab should *not* be administered by intravenous push or bolus injection.<sup>3086</sup>

### Stability

Intact vials of trastuzumab are stable at 2 to 8°C.<sup>3086</sup> Trastuzumab is a white to pale yellow lyophilized powder that forms a clear to slightly opalescent and colorless to pale yellow solution upon reconstitution.<sup>3086</sup>

When reconstituted with the provided bacteriostatic water for injection diluent, vials of the reconstituted multiple-use solution are stable for 28 days if stored at 2 to 8°C; any solution remaining after 28 days should be discarded.<sup>3086</sup> Vials of trastuzumab reconstituted with unpreserved sterile water for injection should be used immediately; any unused portions should be discarded.<sup>3086</sup> The manufacturer states that trastuzumab should not be mixed with other drugs.<sup>3086</sup>

Diluted trastuzumab infusion solutions should be stored at 2 to 8°C for no longer than 24 hours prior to use.<sup>3086</sup> Although trastuzumab solutions diluted to concentrations of 0.4, 1, or 4 mg/mL (diluent unspecified) were reported to be physically stable with no change in monomer concentration for up to 28 days when stored at 2 to 8°C, biological activity was not reported in this study.<sup>3089</sup>

Reconstituted solutions or solutions diluted for infusion should not be frozen.<sup>3086</sup>

### Temperature Effects

In a study evaluating the physical stability of trastuzumab, solutions containing trastuzumab (Roche) 0.4 or 4 mg/mL (diluent unspecified) showed no increase in particle size up to a temperature of 65°C.<sup>3089</sup> At 75°C, the solutions became turbid, suggesting the formation of insoluble aggregates; following centrifugation, particle size analysis also revealed soluble aggregates within the clear supernatant.<sup>3089</sup> Additional spectrophotometric evaluation showed a loss of ordered structure of the drug at temperatures of 75°C.<sup>3089</sup>

### Filtration

Use of an inline filter was not required for administration of trastuzumab-containing solutions in clinical studies.<sup>3087</sup> The manufacturer makes no recommendations regarding filtration of the drug.<sup>3086</sup>

## Treprostinil Sodium

AHFS 48:48

### Products

Treprostinil is available as 1-, 2.5-, 5-, and 10-mg/mL (as sodium) in 20-mL multiple-dose vials. Each mL also contains sodium chloride 5.3 mg (except the 10-mg/mL concentration which contains 4 mg), metacresol 3 mg, and sodium citrate 6.3 mg in water for injection. Sodium hydroxide and/or hydrochloric acid may have been added during manufacturing to adjust the pH.<sup>1(9/08)</sup>

### pH

From 6.0 to 7.2.<sup>1(9/08)</sup>

### Trade Name(s)

Remodulin

### Administration

Treprostinil sodium is preferably administered by continuous subcutaneous infusion using a syringe pump designed for subcutaneous administration. The drug may also be administered via a central venous catheter only after dilution in sterile water for injection, sodium chloride 0.9%, or Flolan special diluent using an intravenous infusion pump. The subcutaneous or intravenous infusion pump must have a reservoir made of polypropylene, polyvinyl chloride, or glass.<sup>1(9/08)</sup>

### Stability

Intact vials should be stored at controlled room temperature. The drug is stable at room temperature and neutral pH. The

manufacturer recommends using the vials for no more than 14 days after initial stopper penetration. The undiluted drug is stable for up to 72 hours at 37°C during administration in syringe reservoirs. The manufacturer states that after dilution in sterile water for injection, sodium chloride 0.9%, or Flolan special diluent, the drug is stable for 48 hours at 37°C at concentrations as low as 4 mcg/mL.<sup>1(9/08)</sup>

Using proper technique to penetrate the vial stopper with a needle, limiting the number of punctures of a vial stopper to 10, and using a Clave Connector Multidose Vial Adapter were shown to reduce the amount of particulate matter from the stopper that was found upon multiple-day use of treprostinil sodium 1- and 10-mg/mL vials and to be within the USP limit for such particulate matter over the 30-day test period. No loss of treprostinil sodium occurred during this period as well. Improper needle technique and numerous stopper penetrations were found to result in unacceptable particulate matter from the vial stopper.<sup>2611</sup>

### Syringes

The chemical and physical stability of undiluted treprostinil sodium (United Therapeutics) 1, 2.5, 5, and 10 mg/mL was evaluated packaged in 3-mL MiniMed plastic syringe pump reservoirs sealed with plastic tip caps. The samples were stored at 37, 23, 4, and -20°C for 60 days. The samples were clear and colorless, and treprostinil was stable at all four storage temperatures, exhibiting concentrations of 95% or more over 60 days.<sup>2528</sup>

## Trimethobenzamide Hydrochloride

AHFS 56:22.08

### Products

Trimethobenzamide hydrochloride 100 mg/mL is available in 2-mL single-dose and 20-mL multiple-dose vials. Each mL of solution also contains sodium citrate, citric acid, and sodium hydroxide to adjust pH. Some products may contain edetate disodium. The multiple-dose vials also contain phenol 0.45%.<sup>1(6/09)</sup>

### pH

The official pH range is 4.5 to 5.5.<sup>17</sup> The manufacturer indicates the actual pH is approximately 5.<sup>1(6/09)</sup>

### Trade Name(s)

Tigan

### Administration

Trimethobenzamide hydrochloride is administered by intramuscular injection deep into the upper outer quadrant of the gluteal region. Intravenous injection is not recommended.<sup>1(6/09) 4</sup>

### Stability

Trimethobenzamide hydrochloride should be stored at controlled room temperature and protected from freezing.<sup>1(6/09) 4</sup>

## Trimethoprim–Sulfamethoxazole

AHFS 8:12.20

Co-trimoxazole

### Products

Trimethoprim–sulfamethoxazole 16 + 80 mg/mL is available as a concentrate in 5-, 10-, and 30-mL vials. Each mL also contains propylene glycol, ethyl alcohol, diethanolamine, benzyl alcohol, sodium metabisulfite, and sodium hydroxide to adjust pH in water for injection.<sup>1(9/08)</sup>

### pH

From 9.5 to 10.5.<sup>1(9/08)</sup>

### Osmolality

The osmolalities of trimethoprim–sulfamethoxazole (Burroughs Wellcome) in concentrations of 0.8 + 4, 1.1 + 5.5, and 1.6 + 8 mg/mL in dextrose 5% were determined to be 541, 669, and 798 mOsm/kg, respectively. At 1.6 + 8 mg/mL in sodium chloride 0.9%, the osmolality was determined to be 833 mOsm/kg.<sup>1375</sup>

### Trade Name(s)

Bactrim

### Administration

Trimethoprim–sulfamethoxazole is administered by intravenous infusion only after dilution in dextrose 5%. The drug should not be injected intramuscularly. Infusion over 60 to 90 minutes is recommended; rapid or direct intravenous injection must not be used. It is recommended that each 5 mL be diluted in 125 mL or, if fluid restriction is required, in 75 mL of dextrose 5%. Infusion admixtures should be inspected for cloudiness or crystallization before and during administration.<sup>1(9/08)</sup> 4

### Stability

Trimethoprim–sulfamethoxazole in intact vials should be stored at controlled room temperature and not refrigerated. The multiple-dose vials should be used within 48 hours of initial entry.<sup>1(9/08)</sup>

The solubility of trimethoprim in aqueous solutions is partially dependent on the pH of the solution. Trimethoprim is a weak base, and its solubility is lower in solutions with a more alkaline pH.<sup>553</sup>

Precipitation occurs in the diluted infusion solution in varying time periods, depending on the final concentration. For dilutions of 5 mL per 125 mL of dextrose 5% (trimethoprim 640 mg/L, sulfamethoxazole 3.2 g/L), use within 6 hours is recommended.<sup>1(9/08)</sup> However, precipitation within 4 hours has been

observed at this concentration.<sup>553</sup> For dilutions of 5 mL per 100 mL of dextrose 5% (trimethoprim 800 mg/L, sulfamethoxazole 4 g/L), use within 4 hours is recommended. For dilutions of 5 mL per 75 mL of dextrose 5% (trimethoprim 1.067 g/L, sulfamethoxazole 5.33 g/L), use within 2 hours is recommended. All infusions should be inspected carefully and watched closely for turbidity and precipitation. Infusion admixtures in dextrose 5% should not be refrigerated.<sup>1(9/08)</sup> 4

The nature of the precipitate that forms from 7 infusion solutions containing trimethoprim–sulfamethoxazole (Roche) was evaluated. In all cases, the sulfamethoxazole concentrations were within 5% of expected values, but the trimethoprim concentrations dropped to about 30% of the initial values. Further evaluation of the solid phases showed them to be trimethoprim alone or with trimethoprim monohydrate.<sup>1895</sup>

### Syringes

Undiluted trimethoprim–sulfamethoxazole (Elkins-Sinn) 16 + 80 mg/mL was stored in polypropylene syringes (Becton Dickinson) for 2.5 days at room temperature. The syringes were exposed to fluorescent light during the day but kept in the dark at night. No loss was observed.<sup>1582</sup>

### Sorption

Trimethoprim was shown not to exhibit sorption to polyvinyl chloride (PVC) bags and tubing, polyethylene tubing, Silastic tubing, and polypropylene syringes.<sup>536 606</sup>

### Plasticizer Leaching

Trimethoprim–sulfamethoxazole (Elkins-Sinn) 0.8 + 4 mg/mL in dextrose 5% did not leach diethylhexyl phthalate (DEHP) plasticizer from 50-mL PVC bags in 24 hours at 24°C.<sup>1683</sup>

### Filtration

Filtration of dilutions of trimethoprim–sulfamethoxazole (Roche), ranging from 1:25 (v/v) to 1:10 (v/v) in several common intravenous infusion solutions, did not appear to result in loss of either drug because of sorption to the filter. Filtration of a visibly precipitated solution resulted in a substantial loss of trimethoprim.<sup>747</sup>

Trimethoprim–sulfamethoxazole (Roche) 1.88 mg/mL in dextrose 5% and sodium chloride 0.9% was filtered through a 0.22- $\mu$ m cellulose ester membrane filter (Ivex-HP, Millipore) over 6 hours. No significant drug loss due to binding to the filter was noted.<sup>1034</sup>

# Tropisetron Hydrochloride

AHFS 56:22.20

## Products

Tropisetron hydrochloride is available as an aqueous solution in 2- and 5-mL ampuls. Each mL of solution provides 1 mg of tropisetron (present as 1.13 mg of the hydrochloride). Also present in the formulation are acetic acid, sodium acetate, sodium chloride, and water for injection.<sup>38 115</sup>

## Trade Name(s)

Navoban

## Administration

Tropisetron hydrochloride is administered either as a slow intravenous injection over not less than 30 seconds for a 2-mg dose<sup>38 115</sup> or 1 minute for a 5-mg dose<sup>115</sup> or as an intravenous infusion over 15 minutes.<sup>38</sup>

## Stability

Tropisetron hydrochloride injection is a colorless or faintly brown-yellow solution. Intact ampuls should be stored at room temperature.<sup>38</sup>

## Syringes

Tropisetron hydrochloride (Sandoz) 1 mg/mL was packaged in polypropylene syringes (Becton Dickinson) and stored under refrigeration at 4°C and at room temperature (about 23°C) exposed to daylight and protected from light for 15 days. About 4% loss of tropisetron hydrochloride occurred in 15 days under any of the storage conditions.<sup>2298</sup>

## Sorption

The manufacturer indicates that tropisetron hydrochloride solutions are compatible with both glass and PVC containers and infusion sets.<sup>38</sup>

## Valproate Sodium

AHFS 28:12.92

### Products

Valproate sodium is available in 5-mL single-dose (preservative-free) vials.<sup>3423</sup> Each mL of solution contains valproate sodium equivalent to valproic acid 100 mg and edetate disodium 0.4 mg in water for injection.<sup>3423</sup> Sodium hydroxide and/or hydrochloric acid are used to adjust pH during manufacture.<sup>3423</sup> The solution should be diluted for use.<sup>3423</sup>

### pH

Adjusted to 7.6.<sup>3423</sup>

### Trade Name(s)

Depacon

### Administration

Valproate sodium is intended for intravenous use only.<sup>3423</sup> The manufacturer recommends that the drug be administered as an intravenous infusion over 60 minutes at a rate that does not exceed 20 mg/min following dilution of the appropriate dose in at least 50 mL of a compatible infusion solution.<sup>3423</sup> (See Solution Compatibility.) For many indications, the manufacturer also recommends that total daily dosages exceeding 250 mg be administered in divided doses.<sup>3423</sup>

The manufacturer states that there is limited experience with infusion of valproate sodium over less than 60 minutes or at rates

of infusion exceeding 20 mg/min.<sup>3423</sup> In a safety study, a more rapid infusion of a single dose of the drug over 5 to 10 minutes (1.5 to 3 mg/kg/min) was used.<sup>3423</sup> More rapid infusion rates (e.g., 3 to 6 mg/kg/min) of sometimes larger doses (e.g., loading dose) also have been used in other studies or are recommended in some guidelines for certain indications.<sup>3438 3439 3440 3441 3442 3443</sup> While patients in such studies generally tolerated such infusions well,<sup>3423 3439 3440 3441 3442 3443</sup> the manufacturer states that rapid infusion of valproate sodium has been associated with an increase in adverse reactions.<sup>3423</sup>

### Stability

Valproate sodium injection is a clear, colorless solution.<sup>3423</sup> Intact vials should be stored at controlled room temperature of 15 to 30°C.<sup>3423</sup> Because no antibacterial preservatives are present in the formulation, any unused solution remaining in a vial after entry should be discarded.<sup>3423</sup>

### Syringes

Valproate sodium (Sanofi) 20 mg/mL in sodium chloride 0.9% packaged in 40-mL polypropylene syringes (BD) was physically and chemically stable for 30 days stored at 2 to 8°C protected from light.<sup>3523</sup>

Valproate sodium (Mylan) 600 mg/50 mL in sodium chloride 0.9% in a 50-mL polypropylene syringe (BD) was physically stable for 48 hours at room temperature.<sup>3545</sup>

# Vancomycin Hydrochloride

AHFS 8:12.28.16

## Products

Vancomycin hydrochloride is available in single-dose vials containing drug equivalent to 250 mg, 500 mg, 750 mg, 1 g, 1.25 g, and 1.5 g of vancomycin base, and pharmacy bulk packages containing drug equivalent to 5, 10, and 100 g of vancomycin base.<sup>3464 3465 3466 3467 3468 3469</sup> To reconstitute single-use vials, 5 mL of sterile water for injection should be added for each 250 mg of vancomycin lyophilized powder contained in the vial (e.g., add 15 mL of sterile water to reconstitute a 750-mg vial of vancomycin) to yield a solution with a vancomycin concentration of 50 mg/mL.<sup>3464 3465 3466</sup> Pharmacy bulk packages containing 5 g of vancomycin should be reconstituted with 100 mL of sterile water for injection to yield a solution with a vancomycin concentration of 50 mg/mL.<sup>3467 3468</sup> Pharmacy bulk packages containing 10 or 100 g of vancomycin should be reconstituted with 95 or 950 mL, respectively, of sterile water for injection to yield a solution with a vancomycin concentration of 100 mg/mL.<sup>3467 3469</sup> The appropriate dose of the reconstituted solution prepared from single-dose vials must be further diluted in a compatible diluent to achieve a final vancomycin concentration of 5 mg/mL (e.g., 500 mg in at least 100 mL, 750 mg in at least 150 mL, 1 g in at least 200 mL).<sup>3464 3465 3466</sup> The appropriate dose of the reconstituted solution prepared from pharmacy bulk packages must be further diluted in at least 100 mL of a compatible diluent;<sup>3467 3468</sup> <sup>3469</sup> some manufacturers state that doses of 1 g must be diluted in at least 200 mL of a compatible diluent.<sup>3467 3468</sup> Manufacturers state that vancomycin concentrations of no more than 5 mg/mL are recommended in adults.<sup>3464 3465 3466 3467 3468 3471 3472</sup> More concentrated vancomycin solutions (i.e., up to 10 mg/mL) may be considered for use in selected patients (e.g., fluid-restricted patients); however, use of such solutions increases the risk of infusion-related adverse effects.<sup>3464 3465 3466</sup>

Vancomycin hydrochloride is available in ADD-Vantage vials containing drug equivalent to 500 mg, 750 mg, and 1 g of vancomycin base.<sup>3472</sup> ADD-Vantage vials containing 500 mg of vancomycin should be prepared with *at least* 100 mL of dextrose 5% or sodium chloride 0.9% in ADD-Vantage diluent bags; ADD-Vantage vials containing 750 mg or 1 g of vancomycin should be prepared *only* with 250 mL of dextrose 5% or sodium chloride 0.9% in ADD-Vantage diluent bags.<sup>3472</sup> The manufacturer states that the use of ADD-Vantage vials is indicated only when doses reflecting the full strength of the available products are determined to be appropriate; if vancomycin doses of 500 mg, 750 mg, or 1 g are not appropriate (e.g., in neonates, infants, and pediatric patients requiring doses less than 500 mg), conventional vials of vancomycin hydrochloride should be used.<sup>3472</sup>

Vancomycin hydrochloride also is available in several ready-to-use formulations.<sup>3470 3471</sup> Vancomycin hydrochloride is available as a frozen iso-osmotic premixed injection in single-dose Galaxy containers containing the equivalent of 500 mg, 750 mg, and 1 g of vancomycin base in 100, 150, and 200 mL, respectively, of dextrose 5% or sodium chloride 0.9%.<sup>3470</sup> Each 100 mL

of the premixed solution also contains either 5 g of dextrose hydrous or 0.9 g of sodium chloride, and the pH may have been adjusted with hydrochloric acid and/or sodium hydroxide.<sup>3470</sup> Vancomycin hydrochloride is available as a premixed injection in single-dose bags containing the equivalent of 500 mg, 1 g, 1.5 g, and 2 g of vancomycin base in 100, 200, 300, and 400 mL, respectively.<sup>3471</sup> Each 100 mL of the premixed solution also contains polyethylene glycol (PEG) 400 1.8 mL, *N*-acetyl-D-alanine (NADA) 1.36 g, and L-lysine hydrochloride (monochloride) 1.26 g in water for injection; hydrochloric acid and sodium hydroxide are used for pH adjustment.<sup>3471</sup> The PEG- and NADA-containing formulation should *not* be used in certain patients (e.g., pregnant women, patients younger than 1 month of age, pediatric patients 1 month of age or older requiring less than the entire dose of a single-dose flexible bag).<sup>3471</sup>

## pH

A 50- or 100-mg/mL reconstituted solution of vancomycin prepared with sterile water for injection has a pH ranging from 2.5 to 4.5.<sup>3464 3466 3467 3468 3469</sup>

Premixed infusion solutions of vancomycin (Baxter) 5 mg/mL in dextrose 5% or sodium chloride 0.9% have a pH ranging from 3 to 5.<sup>3470</sup>

Premixed infusion solutions of vancomycin (Xellia) 5 mg/mL have a pH ranging from 4.5 to 5.5.<sup>3471</sup>

## Osmolality

Vancomycin hydrochloride (Lilly) prepared at a vancomycin concentration of 50 mg/mL in sterile water for injection has an osmolality of 57 mOsm/kg.<sup>50</sup>

The osmolality of vancomycin hydrochloride (Lederle) prepared at a vancomycin concentration of 5 mg/mL was determined to be 249 mOsm/kg in dextrose 5% and 291 mOsm/kg in sodium chloride 0.9%.<sup>1375</sup>

The osmolality of vancomycin hydrochloride (Sandoz) prepared at a vancomycin concentration of 62.5 mg/mL was determined to be 363 to 383 mOsm/kg in dextrose 5% and 337 to 351 mOsm/kg in sodium chloride 0.9%.<sup>3603</sup> The osmolality of vancomycin hydrochloride (Sandoz) prepared at a vancomycin concentration of 83.3 mg/mL was determined to be 379 to 409 mOsm/kg in dextrose 5% and 362 to 378 mOsm/kg in sodium chloride 0.9%.<sup>3603</sup>

## Osmolarity

The osmolarity of premixed infusion solutions of vancomycin (Xellia) 5 mg/mL ranges from 350 to 475 mOsm/L.<sup>3471</sup>

## Administration

Vancomycin hydrochloride is administered by intravenous infusion.<sup>3464 3465 3466 3467 3468 3469 3470 3471 3472</sup> The reconstituted solution must be diluted in a compatible infusion solution prior to administration.<sup>3464 3465 3466 3467 3468 3469</sup> The drug is extremely

irritating to tissue and may cause necrosis; therefore, it should not be given by intramuscular injection and extravasation should be avoided during intravenous administration.<sup>3464 3465 3466 3467 3468 3469 3470 3471 3472</sup> The frequency and severity of thrombophlebitis can be minimized by administering the drug slowly, using dilute solutions of 2.5 to 5 mg/mL, and rotating venous access sites.<sup>3464 3465 3466 3467 3468 3469 3470 3471 3472</sup>

Manufacturers recommend intermittent intravenous infusion as the preferred method of administration.<sup>3464 3466 3467 3468 3469 3470 3472</sup> Some manufacturers recommend that the drug be administered over a period of at least 60 minutes in adults.<sup>3465 3471</sup> Other manufacturers state that administration rates of no more than 10 mg/min are recommended in adults or that the drug should be administered at a rate no faster than 10 mg/min or over a period of at least 60 minutes, whichever is longer.<sup>3464 3466 3467 3468 3469 3470 3472</sup> In pediatric patients, the drug should be administered over a period of at least 60 minutes;<sup>3464 3465 3466 3467 3468 3469 3470 3471 3472</sup> in neonates, the drug should be administered over a period of 60 minutes.<sup>3464 3465 3466 3467 3468 3469 3470 3472</sup>

Vancomycin hydrochloride (Baxter) frozen iso-osmotic premixed injection in single-dose Galaxy containers should be thawed (see Stability: Freezing Solutions), and the solution should be administered by intravenous infusion.<sup>3470</sup>

## Stability

Vancomycin hydrochloride is a lyophilized powder that varies in color from white or off white to light tan, tan, buff, or brownish.<sup>3464 3465 3467 3468 3469</sup> Intact vials and pharmacy bulk packages should be stored at controlled room temperature.<sup>3464 3465 3466 3467 3468 3469</sup> Manufacturers indicate that after reconstitution, single-dose vials of vancomycin hydrochloride may be stored in a refrigerator for 14 days with no significant loss of potency,<sup>3464 3465 3466</sup> other information has indicated that the drug also is stable in solution for 14 days at room temperature.<sup>141</sup>

Intact ADD-Vantage vials of vancomycin hydrochloride should be stored at controlled room temperature.<sup>3472</sup> Solutions prepared using the ADD-Vantage vials may be stored in a refrigerator 14 days for with no significant loss of potency.<sup>3472</sup>

## pH Effects

In the pH range of 2 to 10, vancomycin hydrochloride degradation occurs principally via deamidation.<sup>1927</sup> Vancomycin hydrochloride has been reported to be most stable at pH 3 to 5<sup>141</sup> and at pH 5.5,<sup>1927</sup> with relatively pH-independent decomposition in the range of 3 to 8.<sup>1927</sup> The stability of a 1-mg/mL concentration was evaluated in buffer solutions having pH values of 1.4, 5.6, and 7.1 at 24°C. Little or no loss occurred in 24 hours in any solution. However, the pH 1.4 buffer had a 19% loss in 5 days, the pH 5.6 buffer had a 10% loss in 17 days, and the pH 7.1 buffer had an 11% loss in 5 days.<sup>1134</sup>

In an accelerated study at 66°C, the half-life of vancomycin B (the largest component of the commercial product) was 400 minutes in a phosphate buffer with a pH of 2.2 and 650 minutes in a phosphate buffer with a pH of 7.<sup>1354</sup>

Vancomycin hydrochloride has a low pH and may cause chemical or physical instability when mixed with other drugs,

especially drugs with an alkaline pH.<sup>873 3464 3465 3466 3467 3468 3469 3471 3472</sup>

The concentration dependency of compatibility or incompatibility of vancomycin hydrochloride mixed with or administered simultaneously with a number of penicillins and cephalosporins has been demonstrated.<sup>2189</sup> Vancomycin hydrochloride is variably compatible with drugs having neutral to mildly alkaline pH, including cephalosporins and penicillins. The compatibility may depend on a number of factors including concentration of each drug, dilution vehicle, actual pH of solutions, and completeness of mixing during administration. Combinations that are compatible when well mixed may result in precipitation if only partially mixed, presumably due to regionally different concentrations and pH values. If attempting to administer vancomycin hydrochloride with another drug product, care should be taken to ensure that the specific combination and concentrations are compatible under the exact administration conditions to be used. An inline filter should be used as a final safety measure.<sup>2189</sup>

## Freezing Solutions

The commercially available, premixed frozen injection of vancomycin hydrochloride in single-dose Galaxy containers should be stored in a freezer capable of maintaining the temperature at or below -20°C.<sup>3470</sup> Frozen product containers should be handled with care since they may be fragile in the frozen state.<sup>3470</sup> Freezing of the solution may cause components of the solution to precipitate, but this precipitate will dissolve at room temperature, apparently without affecting potency.<sup>3470</sup> Solutions should be thawed at room temperature (25°C) or under refrigeration (5°C).<sup>3470</sup> Solutions should not be subject to force thawing (e.g., by immersion in water baths or microwaving).<sup>3470</sup> Thawed solutions should not be refrozen.<sup>3470</sup> After the thawed solution has reached room temperature, the solution should be agitated.<sup>3470</sup> The manufacturer indicates that thawed solutions remain chemically stable for 72 hours at room temperature (25°C) or 30 days refrigerated (5°C).<sup>3470</sup>

Vancomycin hydrochloride (Lilly) prepared at a vancomycin concentration of 5 mg/mL in dextrose 5% or sodium chloride 0.9% exhibited no loss after 63 days of storage when frozen at -10°C. However, neither did a loss occur in the same time period when the solution was stored at 5°C.<sup>1134</sup>

In one study, vancomycin hydrochloride (Lilly) prepared at a vancomycin concentration of 5 mg/mL in dextrose 5% was stored frozen at -20°C for 105 days. After thawing in a microwave, the samples were stored for 56 more days under refrigeration. The samples remained clear and had no color change. In addition, no loss of vancomycin occurred throughout the entire test period.<sup>2682</sup>

## Syringes

The stability of vancomycin hydrochloride (Lilly) prepared at a vancomycin concentration of 5 mg/mL in dextrose concentrations ranging from 5 to 30% and packaged in plastic syringes was studied. The syringes were stored at 4°C for 24 hours followed by 2 hours at room temperature. Little change in the concentration occurred.<sup>1301</sup>

The stability of vancomycin hydrochloride (Lilly) reconstituted to a vancomycin concentration of 10 mg/mL with sterile water for injection, dextrose 5%, and sodium chloride 0.9% repackaged into plastic syringes was studied. Five mL of the solutions were filled into 3-piece Plastipak (Becton Dickinson) and 2-piece Injekt (Braun) syringes that were then sealed with Luer-Lok hubs (Vigon) and stored at 4 and 25°C for 84 days. Under refrigeration, vancomycin hydrochloride prepared with all 3 solutions and packaged in both kinds of syringes was physically and chemically stable for the 84-day period; losses were 4% or less.<sup>1893</sup> However, stored at 25°C in the Plastipak syringes, 10% loss occurred in about 47 days in water, 55 days in dextrose 5%, and 62 days in sodium chloride 0.9%. In the Injekt syringes, stability was less; 10% loss occurred in 29 days in water, 33 days in dextrose 5%, and 34 days in sodium chloride 0.9%. In addition, a degradation product appeared as a white flocculent precipitate in all room temperature samples after about 8 weeks of storage.<sup>1893</sup>

Vancomycin hydrochloride prepared at a vancomycin concentration of 5 mg/mL in dextrose 5% and in sodium chloride 0.9% packaged in polypropylene syringes (Becton Dickinson) exhibited less than 10% loss in 14 days at room temperature and in 6 months under refrigeration. Refrigerated solutions warmed to room temperature were stable for 48 hours.<sup>2730</sup>

Vancomycin hydrochloride (Mylan) prepared at a vancomycin concentration of 2 g/48 mL in dextrose 5% and in sodium chloride 0.9% packaged in polypropylene syringes (Terumo) was physically and chemically stable for up to 48 hours at an ambient temperature ranging from 18 to 25°C.<sup>3602</sup>

No visual or subvisual changes were noted in polypropylene syringes containing vancomycin hydrochloride prepared at vancomycin concentrations of 40, 50, 58.8, 71, and 83.3 mg/mL in sodium chloride 0.9% in 24 hours at room temperature and 83.3 mg/mL in both sodium chloride 0.9% and dextrose 5% in 48 hours at room temperature.<sup>3603</sup>

Vancomycin hydrochloride (Sandoz) prepared at a vancomycin concentration of 3 g/48 mL in dextrose 5% and packaged in 50-mL polypropylene Plastipak (Becton Dickinson) syringes exhibited little loss in 24 hours at 20 to 25°C with no degradation products, change in pH, or visible modifications noted.<sup>3603</sup> Syringes prepared at a vancomycin concentration of 4 g/48 mL in dextrose 5% exhibited a slight yellow color change and little loss in 6 hours at 20 to 25°C.<sup>3603</sup> While the concentration of vancomycin in one of the 3 syringes (tested in triplicate) dropped below 90% of the initial concentration at 24 hours, the concentration in that syringe measured well above 90% of the initial concentration at 48 hours.<sup>3603</sup> Authors attributed these results to a technical problem likely related to the multiple dilutions required to achieve the desired theoretical concentration of the drug and concluded that the drug was physically and chemically stable for 48 hours at 20 to 25°C.<sup>3603</sup>

Vancomycin hydrochloride (Sandoz) prepared at a vancomycin concentration of 3 g/48 mL in sodium chloride 0.9% and packaged in 50-mL polypropylene Plastipak (Becton Dickinson) syringes exhibited little loss in 48 hours at 20 to 25°C without any physical changes noted.<sup>3603</sup> Syringes prepared at a vancomycin concentration of 4 g/48 mL in sodium chloride 0.9%

exhibited little loss in 24 hours at 20 to 25°C, but a precipitate was observed after 48 hours of storage.<sup>3603</sup>

### **Elastomeric Reservoir Pumps**

Vancomycin hydrochloride (Lilly) prepared at a vancomycin concentration of 10 mg/mL in both dextrose 5% and sodium chloride 0.9% was evaluated for binding potential to natural rubber elastomeric reservoirs (Baxter). No binding was found after storage for 2 weeks at 35°C with gentle agitation.<sup>2014</sup>

### **Implantable Pumps**

Vancomycin hydrochloride (Lilly) prepared at a vancomycin concentration of 1 mg/mL in water in an implantable pump (Infusaid model 100) was incubated in a water bath at 37°C for 28 days. Vancomycin losses were substantial, with about 25% loss in 7 days and 40% loss in 28 days. At the end of the test period, a colloidal precipitate also was found in the pumps.<sup>1302</sup>

### **Sorption**

Vancomycin hydrochloride (Lilly) prepared at a vancomycin concentration of 15 mg/mL in dextrose 5% is reported to undergo substantial sorption to Teflon tubing used in an automatic dilutor (Syva). The vancomycin hydrochloride was apparently released from the tubing into subsequent solutions resulting in vancomycin toxicity.<sup>2153</sup>

Vancomycin hydrochloride prepared at a vancomycin concentration of 10 mg/mL with heparin sodium 5000 units/mL as an antibiotic lock in polyurethane central hemodialysis catheters lost about 50% of the antibiotic over 72 hours at 37°C. The loss was attributed to sorption to the catheters, although precipitation is also possible. Nevertheless, the reduced antibiotic concentration (about 5 mg/mL) remained effective against common microorganisms in catheter-related bacteremia in hemodialysis patients.<sup>2515 2516</sup>

### **Plasticizer Leaching**

Vancomycin hydrochloride (Qualimed Laboratories) prepared at a vancomycin concentration of 8 mg/mL in dextrose 5% and sodium chloride 0.9% in polyvinyl chloride (PVC) containers (Macropharma) did not leach detectable amounts of diethylhexyl phthalate (DEHP) plasticizer during simulated administration over 24 hours. If any DEHP was present, the concentration was less than 1 mcg/mL, the limit of detection in this study.<sup>2148</sup>

### **Filtration**

Vancomycin hydrochloride (Lilly) prepared at a vancomycin concentration of 2 mg/mL in dextrose 5% or sodium chloride 0.9% was filtered through a 0.22- $\mu$ m cellulose ester filter (Ivex-HP, Millipore) over 6 hours. No significant drug loss due to binding to the filter was noted.<sup>1034</sup>

### **Central Venous Catheter**

Vancomycin hydrochloride (Fujisawa) prepared at a vancomycin concentration of 2 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

## Compatibility Information

<sup>a</sup> Tested in dextrose 5%.

<sup>b</sup> Tested in sodium chloride 0.9%.

<sup>c</sup> Tested in both dextrose 5% and sodium chloride 0.9%.

<sup>d</sup> Tested in sterile water for injection.

<sup>e</sup> Tested in a 1:1 mixture of dextrose 5% and TPN #274 (see Appendix).

<sup>f</sup> Concentration unspecified.

<sup>g</sup> Infused over one hour simultaneously with methotrexate.

<sup>h</sup> Tested with 0.1% albumin human added.

<sup>i</sup> Lyophilized formulation tested.

<sup>j</sup> Refer to Appendix for the composition of parenteral nutrition solutions. TNA indicates a 3-in-1 admixture, and TPN indicates a 2-in-1 admixture.

<sup>k</sup> Run at 21 mL/hr.

<sup>l</sup> Given over 30 minutes by syringe pump.

<sup>m</sup> Run at 94 mL/hr.

<sup>n</sup> Run at 10 mL/hr.

<sup>o</sup> Given over one hour by syringe pump.

<sup>p</sup> Tested in a 1:1 mixture of (1) dextrose 5% and dextrose 5% in sodium chloride 0.45% with and without potassium chloride 20 mEq/L and also in (2) dextrose 10% in sodium chloride 0.45% with and without potassium chloride 20 mEq/L.

<sup>q</sup> Tested with albumin human 0.1%.

<sup>r</sup> Test performed using the formulation WITHOUT edetate disodium.

<sup>s</sup> Tested in either dextrose 5% or in sodium chloride 0.9%, but the report did not specify which solution.

<sup>t</sup> Ampicillin component. Ampicillin in a 2:1 fixed-ratio concentration with sulbactam.

<sup>u</sup> Piperacillin component. Piperacillin in an 8:1 fixed-ratio concentration with tazobactam.

<sup>v</sup> Meropenem component. Meropenem in a 1:1 fixed-ratio concentration with vaborbactam.

<sup>w</sup> If sterile water for injection is used as the diluent, manufacturers recommend a maximum volume per dose of 50 mL.

<sup>x</sup> Ceftolozane component. Ceftolozane in a 2:1 fixed-ratio concentration with tazobactam.

<sup>y</sup> Run at 25 mL/hr with dextrose 5% run at 83 mL/hr.

<sup>z</sup> Run at 100 mL/hr.

<sup>aa</sup> Test performed using the formulation WITH edetate disodium.

<sup>bb</sup> Tested as the premixed infusion solution.

<sup>cc</sup> Ceftazidime component. Ceftazidime in a 4:1 fixed-ratio concentration with avibactam.

<sup>dd</sup> Salt not specified.

<sup>ee</sup> Presence or absence of edetate disodium not specified.

<sup>ff</sup> Not specified whether concentration refers to single component or combined components.

**Additional Compatibility Information****Peritoneal Dialysis Solutions**

Reports have revealed that administration of sterile vancomycin by the intraperitoneal route during continuous ambulatory peritoneal dialysis (CAPD) has resulted in a syndrome of chemical peritonitis, ranging from a cloudy dialysate alone to a cloudy dialysate accompanied by variable degrees of abdominal pain

and fever.<sup>3464 3465 3466 3467 3468 3469</sup> Manufacturers state that the safety and efficacy of vancomycin administered by the intra-peritoneal route have not been established by adequate and well-controlled trials.<sup>3464 3465 3466 3467 3468 3469</sup>

The activity of vancomycin 15 mg/L was evaluated in peritoneal dialysis fluids containing dextrose 1.5 or 4.25% (Dianeal 137, Travenol). Storage at 25°C resulted in virtually no loss of antimicrobial activity in 24 hours.<sup>515</sup>

Vancomycin hydrochloride (Lilly) prepared at vancomycin concentrations of 10 and 50 mg/L in peritoneal dialysis concentrate with dextrose 50% (McGaw) retained 93 to 100% of its initial activity after 24 hours of storage at room temperature.<sup>1044</sup>

The stability of vancomycin hydrochloride (Lilly) prepared at a vancomycin concentration of 20 mg/L in peritoneal dialysis solutions (Dianeal 137 and PD-2) with heparin sodium 500 units/L was evaluated. Approximately 95 ± 12% activity remained after 24 hours at 25°C.<sup>1228</sup>

Vancomycin hydrochloride (Lilly) prepared at a vancomycin concentration of 15 mg/L to 5.3 g/L in Dianeal with dextrose 2.5 or 4.25% was physically compatible with heparin sodium (Organon) 500 to 14,300 units/L for 24 hours at 25°C under fluorescent light. However, a white precipitate formed immediately in combinations of heparin sodium with vancomycin hydrochloride 6.9 to 14.3 g/L.<sup>1322</sup>

The retention of antimicrobial activity of vancomycin hydrochloride (Lilly) prepared at a vancomycin concentration of 1 g/L alone and with each of two aminoglycosides, gentamicin sulfate (SoloPak) prepared at a gentamicin concentration of 120 mg/L and tobramycin sulfate (Lilly) prepared at a tobramycin concentration of 120 mg/L, in Dianeal PD-2 (Travenol) with dextrose 1.5% was evaluated. Little or no loss of any antibiotic occurred in 8 hours at 37°C. Vancomycin hydrochloride alone retained activity for at least 48 hours at 4 and 25°C. In combination with gentamicin sulfate and tobramycin sulfate, antimicrobial activity of both vancomycin and the aminoglycosides was retained for up to 48 hours. However, refrigeration at 4°C was recommended for storage periods greater than 24 hours.<sup>1414</sup>

The stability of vancomycin hydrochloride (Lilly) prepared at a vancomycin concentration of 25 mg/L in Dianeal 137 (Baxter) with dextrose 1.36 and 3.86%, while protected from direct sunlight, was evaluated. At both dextrose concentrations, less than 4% vancomycin was lost in 42 days at 4°C. At 20°C, a 5% or less loss occurred in 28 days. At 37°C, a 10% loss occurred in 6 to 7 days.<sup>1654</sup>

Vancomycin hydrochloride (Lilly) prepared at a vancomycin concentration of 1 mg/mL admixed with ceftazidime (Lilly) 0.5 mg/mL in Dianeal PD-2 (Baxter) with 1.5% and also 4.25% dextrose was evaluated for compatibility and stability. Samples were stored under fluorescent light at 4 and 24°C for 24 hours and at 37°C for 12 hours. No precipitation or other change was observed by visual inspection in any sample. No loss of either drug was found in the samples stored at 4°C and no loss of vancomycin and about 4 to 5% ceftazidime loss were found in the samples stored at 24°C in 24 hours. Vancomycin losses of 3% or less and ceftazidime loss of about 6% were found in the samples stored at 37°C for 12 hours. No difference in stability was found between samples at either dextrose concentration.<sup>2217</sup>

Vancomycin hydrochloride (Lederle) prepared at a vancomycin concentration of 0.05 mg/mL in Dianeal PD-2 with dextrose 1.5% with or without heparin sodium 1 unit/mL in PVC bags was chemically stable for up to 6 days at 4°C (about 3 to 5% loss) and 25°C (up to 7% loss) and 5 days at body temperature of 37°C.<sup>866</sup>

The addition of ceftazidime (Glaxo) 0.1 mg/mL to this peritoneal dialysis solution demonstrated a somewhat reduced stability with the ceftazidime being the defining component. The ceftazidime was chemically stable for up to 6 days at 4°C (about 3% loss), 3 days at 25°C (about 9 to 10% loss), and 12 hours at body temperature of 37°C with the vancomycin exhibiting less loss throughout.<sup>866</sup>

Vancomycin hydrochloride (Lederle) prepared at a vancomycin concentration of 25 mcg/mL in Delflex peritoneal dialysis solution bags with 2.5% dextrose (Fresenius) was stable with little loss occurring in 14 days refrigerated and at room temperature.<sup>2573</sup>

Gentamicin sulfate (American Pharmaceutical Partners) prepared at a gentamicin concentration of 8 mcg/mL with vancomycin hydrochloride (Lederle) prepared at a vancomycin concentration of 25 mcg/mL in Delflex peritoneal dialysis solution bags with 2.5% dextrose (Fresenius) was stable with little or no loss of either drug occurring in 14 days refrigerated and at room temperature.<sup>2573</sup>

Vancomycin hydrochloride (Abbott) prepared at a vancomycin concentration of 1 mg/mL in icodextrin 7.5% PD (Baxter) was tested for stability at 5, 24, and 37°C. The solutions remained clear and colorless. Little or no loss at 5°C and about 3% loss at 24°C after 7 days of storage was found. At 37°C, about 6% loss occurred in 24 hours.<sup>2650</sup>

Vancomycin hydrochloride (Hospira) prepared at a vancomycin concentration of 1 g/L in Extraneal with icodextrin 7.5% (Baxter) peritoneal dialysis solution bags exhibited less than 10% loss in 14 days at 25 and 4°C and 2 days at 37°C.<sup>3537</sup> Vancomycin hydrochloride (Hospira) prepared at a vancomycin concentration of 1 g/L with gentamicin sulfate (Pfizer) prepared at a gentamicin concentration of 20 mg/L in Extraneal with icodextrin 7.5% (Baxter) peritoneal dialysis solution bags exhibited less than 10% loss of either drug in 14 days at 25 and 4°C and 7% loss of vancomycin and 3% loss of gentamicin in 4 days at 37°C.<sup>3537</sup>

### Heparin Locks

Vancomycin hydrochloride (Lilly) prepared at a vancomycin concentration of 25 mcg/mL and heparin sodium (Elkins-Sinn) 100 units/mL in sodium chloride 0.9% as a catheter flush solution were evaluated for stability when stored at 4°C for 14 days. The flush solution was visually clear, and the vancomycin activity and heparin activity were retained throughout the storage period. However, an additional 24 hours at 37°C to simulate use conditions resulted in losses of both agents ranging from 20 to 37%.<sup>1933</sup>

Vancomycin hydrochloride (Lilly) prepared at a vancomycin concentration of 25 mcg/mL and preservative-free heparin sodium (Elkins-Sinn) 100 units/mL in sodium chloride 0.9% in 2-mL glass vials for use as a central catheter flush solution were evaluated for compatibility and stability at 4 and 28°C. Visual inspection found no evidence of color change or particulate formation throughout the study. Heparin activity remained unchanged for 100 days. Acceptable vancomycin levels were maintained for 30 days at 28°C and for 63 days at 4°C. However,

unacceptable losses occurred after those times. The activity of both drugs was unaffected by the presence of the other when compared to the activity of single drug controls.<sup>2542</sup>

Vancomycin hydrochloride prepared at a vancomycin concentration of 25 mcg/mL combined with heparin sodium (Hospira) 10 units/mL in sterile water for injection for use as a lock solution was found to be physically compatible. Little or no vancomycin loss occurred in 3 days at 4°C. However, losses of 8% occurred in 3 days at 27°C and 1 day at 40°C.<sup>2820</sup> When ciprofloxacin (Sicor) 2 mg/mL was added to this flush solution, a white precipitate appeared within 1 day. Losses of both ciprofloxacin and vancomycin occurred as well.<sup>2820</sup>

### **Sodium Citrate Locks**

The physical compatibility of catheter lock solutions prepared with sodium citrate 4% anticoagulant solution (Baxter) and vancomycin (manufacturer unspecified) 5, 10, and 20 mg/mL was evaluated.<sup>3482</sup> Solutions were stored 22 to 23°C and at 37°C in a water bath, both exposed to light and in the dark.<sup>3482</sup> No evidence of physical incompatibility was observed throughout the 48-hour study period in admixtures of sodium citrate with vancomycin concentrations of 5 and 10 mg/mL.<sup>3482</sup> However,

admixture containing sodium citrate and vancomycin 20 mg/mL demonstrated spectrophotometric evidence of incompatibility in each of the 4 storage conditions, with demonstrated turbidity as assessed by absorbance.<sup>3482</sup>

The physical compatibility, chemical stability, and antimicrobial activity of catheter lock solutions prepared with sodium citrate 4% anticoagulant solution (Fenwal) combined with vancomycin (manufacturer unspecified) 5 and 10 mg/mL and either gentamicin (Hospira) 1 mg/mL or ethanol 40% (v/v) were evaluated.<sup>3473 3483</sup> Solutions were stored at 25 and 37°C, both with and without light.<sup>3473</sup> All solutions remained visually clear and demonstrated mean pH changes of 0.1 or less from baseline at 72 hours, with the exception of the admixture containing sodium citrate 4% with vancomycin 5 mg/mL and ethanol 40%, which developed slight turbidity after 48 hours in all 4 storage conditions.<sup>3473</sup> Spectrophotometric evaluation demonstrated mean gentamicin and vancomycin concentrations in the range of 95 to 105% of initial concentrations at 72 hours; similarly, antimicrobial activity of gentamicin and vancomycin at 72 hours was calculated to range between 95 and 106% of baseline based on disk diffusion methodology.<sup>3473</sup>

## Vasopressin

AHFS 68:28

### Products

Vasopressin is available in 1-mL vials.<sup>3000</sup> Each mL of solution contains vasopressin 20 units, chlorobutanol 0.5%, water for injection, and acetic acid to adjust the pH.<sup>3000</sup>

### pH

From 3.4 to 3.6.<sup>3000</sup>

### Trade Name(s)

Vasostrict

### Administration

Vasopressin injection is administered by intravenous infusion.<sup>3000</sup> The drug should be diluted to a concentration of 0.1 or 1 unit/mL in sodium chloride 0.9% or dextrose 5% and inspected for particulate matter and discoloration prior to use.<sup>3000</sup>

The drug also has been administered by intramuscular or subcutaneous injection,<sup>3002</sup> however, approved labeling no longer includes information on these routes.<sup>3000</sup>

### Stability

Intact vials should be stored under refrigeration at 2 to 8°C and protected from freezing.<sup>3000</sup> Intact vials removed from refrigeration can be stored at 20 to 25°C for up to 12 months or until the manufacturer's original expiration date (whichever is shorter) at any time within the labeled shelf life.<sup>3000 3001</sup>

Vials should be discarded 48 hours after initial puncture.<sup>3000</sup> Following dilution, unused solutions should be discarded after 18 hours at room temperature or 24 hours under refrigeration.<sup>3000</sup>

## Compatibility Information

### Solution Compatibility

#### Vasopressin

Test Soln Name	Mfr	Mfr	Conc/L or %	Remarks	Ref	C/I
Dextrose 5%		PAR	100 and 1000 units	Stable for 18 hr if stored at room temperature or 24 hr if stored under refrigeration	3000	C
Dextrose 5%		PAR	200 units	Less than 10% loss over 26 hr at 22°C	3001	C
Sodium chloride 0.9%		PAR	100 and 1000 units	Stable for 18 hr if stored at room temperature or 24 hr if stored under refrigeration	3000	C

## Vecuronium Bromide

AHFS 12:20.20

### Products

Vecuronium bromide is available in 10-mg vials as a lyophilized cake, both with and without accompanying bacteriostatic water for injection with benzyl alcohol 0.9% for use as a diluent. It also is available in 20-mg vials without a diluent. The vials also contain citric acid anhydrous, mannitol, and sodium phosphate dibasic anhydrous. Sodium hydroxide and/or phosphoric acid also may be present to adjust the pH.<sup>1(7/07)</sup>

The 10- and 20-mg vials should be reconstituted with 10 and 20 mL, respectively, of the accompanying bacteriostatic water for injection or sterile water for injection to yield a 1-mg/mL solution.<sup>1(7/07)</sup> <sup>4</sup> The bacteriostatic water for injection, which contains benzyl alcohol 0.9%, is not for use in newborns.<sup>1(7/07)</sup>

### pH

From 3.5 to 4.5.<sup>1(7/07)</sup>

### Osmolality

The osmolality of vecuronium bromide 4 mg/mL was determined to be 292 mOsm/kg.<sup>1233</sup>

### Administration

Vecuronium bromide may be administered by rapid intravenous injection or by intravenous infusion using an infusion control

device at a concentration of 0.1 to 0.2 mg/mL in a compatible solution. It should not be administered intramuscularly.<sup>4</sup>

### Stability

Vecuronium bromide should be stored at room temperature and protected from light. The reconstituted solution is clear and colorless. When reconstituted with bacteriostatic water for injection, the solution may be used for up to 5 days when stored at room temperature or under refrigeration. When reconstituted with sterile water for injection, the vial is a single-use container and should be stored under refrigeration and used within 24 hours.<sup>1(7/07)</sup>

### pH Effects

Vecuronium bromide is unstable in the presence of bases and should not be combined with alkaline drugs or simultaneously administered through the same line as an alkaline solution.<sup>4</sup>

### Syringes

Vecuronium bromide 1 mg/mL in sterile water for injection and packaged in plastic syringes was found to be stable with no loss of drug for 21 days at room temperature and refrigerated.<sup>2735</sup>

## Verapamil Hydrochloride

AHFS 24:28.92

### Products

Verapamil hydrochloride is available in single-dose containers including 2-mL ampuls, vials, and syringes and in 4-mL vials and syringes. Each mL contains verapamil hydrochloride 2.5 mg with sodium chloride 8.5 mg in water for injection. Hydrochloric acid may have been used to adjust pH during manufacture.<sup>1(7/06)</sup>

### pH

From 4 to 6.5.<sup>1(7/06)</sup>

### Osmolality

The osmolality of verapamil hydrochloride 2.5 mg/mL was determined to be 290 mOsm/kg.<sup>1233</sup>

### Administration

Verapamil hydrochloride is administered slowly intravenously. Direct intravenous injection should be performed over at least 2 minutes and at least 3 minutes in older patients.<sup>1(7/06)</sup> <sup>4</sup> Intravenous infusion has also been performed.<sup>4</sup>

### Stability

Verapamil hydrochloride should be stored at controlled room temperature and protected from light.<sup>1(7/06)</sup> Freezing should be avoided.<sup>4</sup> It is physically compatible in solution over a pH range of 3 to 6 but may precipitate in solutions having a pH greater than 6<sup>1(7/06)</sup> <sup>4</sup> or 7.<sup>1384</sup>

Verapamil hydrochloride under simulated summer conditions in paramedic vehicles was exposed to temperatures ranging from 26 to 38°C over 4 weeks. Analysis found no loss of the drug under these conditions.<sup>2562</sup>

## Compatibility Information

### Solution Compatibility

#### Verapamil HCl

Test Soln Name	Mfr	Mfr	Conc/L or %	Remarks	Ref	C/I
Dextrose 5% in Ringer's injection	MG	KN	40 mg	Physically compatible and chemically stable for 48 hr at 25°C protected from light	548	C
Dextrose 5% in Ringer's injection, lactated	MG	KN	40 mg	Physically compatible and chemically stable for 24 hr at 25°C protected from light	548	C
Dextrose 5% in sodium chloride 0.45%	MG	KN	40 mg	Physically compatible and chemically stable for 24 hr at 25°C protected from light	548	C
Dextrose 5% in sodium chloride 0.9%	MG	KN	40 mg	Physically compatible and chemically stable for 24 hr at 25°C protected from light	548	C
Dextrose 5%	CU	KN	40 mg	Physically compatible and chemically stable for 48 hr at 25°C protected from light	548	C

# Vinblastine Sulfate

**AHFS 10:00**

## Products

Vinblastine sulfate is available as a 1-mg/mL solution with benzyl alcohol 0.9% in 10-mL vials.<sup>2946</sup> Each mL also contains sodium chloride 9 mg and water for injection.<sup>2946</sup>

## pH

The pH of the vinblastine sulfate injection is 3.5 to 5.<sup>2946</sup>

## Administration

Vinblastine sulfate is administered intravenously only.<sup>2946</sup> It should not be given by any other route.<sup>2946</sup> If the drug is prepared in a syringe, a sticker, which is provided in the vinblastine sulfate package, must be affixed directly to the syringe containing the individual dose stating:

**FOR INTRAVENOUS USE ONLY – FATAL IF GIVEN BY OTHER ROUTES.**<sup>2946</sup>

In addition, the syringe containing the prepared dose must be enclosed in an overwrap, which is labeled:

**DO NOT REMOVE COVERING UNTIL MOMENT OF INJECTION.**

**FOR INTRAVENOUS USE ONLY – FATAL IF GIVEN BY OTHER ROUTES.**<sup>2946</sup>

Vinblastine sulfate may be administered over about 1 minute either directly into a vein or into the tubing of a running infusion solution.<sup>2946</sup> The dose of vinblastine sulfate should not be diluted in larger amounts of intravenous fluid (e.g., 100 to 250 mL) or administered over longer time periods (e.g., 30 to 60 minutes) since this frequently increases vein irritation and the chances of extravasation.<sup>2946</sup> Extravasation should be avoided.<sup>2946</sup>

In the event of spills or leaks, sodium hypochlorite 5% (household bleach) has been used to inactivate vinblastine sulfate.<sup>1200</sup>

## Stability

The vials should be refrigerated to ensure extended stability.<sup>2946</sup> Room temperature stability of intact vials of a Lilly product was variously reported to be at least 1 month<sup>853</sup> and only 14 days,<sup>1433</sup> while a Lyphomed product was reported to be stable for up to 3 months<sup>1181</sup> and for less than 2 months.<sup>1433</sup>

Vinblastine sulfate 0.015 and 0.5 mg/mL in sodium chloride 0.9% did not inhibit the growth of deliberately inoculated *Staphylococcus epidermidis* ( $10^6$  to  $10^7$  CFU/mL) during 21 days at 35°C (representing near body temperature).<sup>1659</sup>

Immersion of a needle with an aluminum component in vinblastine sulfate 1 mg/mL resulted in no visually apparent reaction after 7 days at 24°C.<sup>988</sup>

## pH Effects

Maximum stability for vinblastine sulfate in aqueous solutions was determined to be from pH 2 to 4. Vinblastine sulfate in solution at pH 3 retained 90% after 39 days at 20°C.<sup>1307</sup>

Vinblastine sulfate in solutions having a pH above 6 may form a precipitate of vinblastine base.<sup>1369</sup>

## Freezing Solutions

Vinblastine sulfate (Lilly) 20 mcg/mL in dextrose 5%, Ringer's injection, lactated, and sodium chloride 0.9% underwent no degradation after 4 weeks when frozen at –20°C.<sup>1195</sup>

## Light Effects

It is recommended that vials be protected from light and stored in the outer carton until the time of use.<sup>2946</sup>

The effects of light exposure on a 1.197-mg/mL vinblastine sulfate solution in sterile water for injection were studied. Samples at 25°C were exposed to indirect incandescent (not fluorescent) light intermittently for 12 hours each day; another group was exposed to direct incandescent light intermittently for 12 hours daily with at least 2 additional hours of exposure to sunlight. A third group of samples at 30°C was exposed to continuous direct incandescent light. Both groups of samples exposed directly to light showed substantial losses of vinblastine sulfate. Samples exposed to continuous direct light sustained a 10% loss in about 1 day and a 71% loss in 14 days. Samples intermittently exposed to direct light and sunlight sustained a 10% loss in 8 days and a 23% loss in 15 days. However, samples exposed to intermittent indirect light showed no drug loss in 70 days.<sup>1306</sup>

Under 6% vinblastine loss occurred in 48 hours from a 3-mcg/mL solution in sodium chloride 0.9% contained as a static solution in polybutadiene tubing when exposed to normal mixed daylight and fluorescent light. It was concluded that photodegradation is not a problem with vinblastine sulfate under these conditions.<sup>1378</sup>

## Syringes

Vinblastine sulfate (David Bull Laboratories) 1 mg/mL in polypropylene syringes was stable for 31 days at 8°C and for at least 23 days at 21°C in the dark; little or no loss occurred.<sup>1566</sup>

Vinblastine sulfate (Lilly) 1 mg/mL in sodium chloride 0.9% was packaged in polypropylene syringes (Plastipak, Becton Dickinson) and stored at 25°C protected from light. No vinblastine sulfate loss was found after storage for 30 days.<sup>2155</sup>

## Elastomeric Reservoir Pumps

Vinblastine sulfate 0.2 mg/mL in both dextrose 5% and sodium chloride 0.9% was evaluated for binding potential to natural rubber elastomeric reservoirs (Baxter). Less than 1% binding was found after storage for 2 weeks at 35°C with gentle agitation.<sup>2014</sup>

## Implantable Pumps

Vinblastine sulfate (Lilly) 1 mg/mL in bacteriostatic sodium chloride 0.9% was evaluated for stability in an implantable pump (Infusaid model 400). In this in vitro assessment, a 24% vinblastine loss occurred in 24 hours at 37°C with mild agitation. In 12 days, the loss totaled 48%. In comparison, control

solutions in glass vials had no drug loss in 24 hours and a 20% loss in 12 days at 37°C. The authors believed that this indicated an interaction of vinblastine with some component of the Infusaid model 400, rendering it unsuitable for administration with this infusion device.<sup>767</sup>

### Sorption

The stability of vinblastine sulfate (Lilly) 3 mcg/mL in methacrylate butadiene styrene (Avon A2001 Sureset) and cellulose propionate (Avon A200 standard and A2000 Amberset) when exposed to normal mixed daylight and fluorescent light for up to 48 hours was evaluated. A maximum vinblastine loss of about 5% resulted in the Sureset, with as little as a 2.25% loss occurring with foil wrapping. However, significant losses occurred in both cellulose propionate burettes in 24 hours, and losses of 15 to 20% occurred in 48 hours. The vinblastine sulfate solution in the polybutadiene tubing of the Sureset showed no more than a 6% drug loss with or without light protection. However, in the polyvinyl chloride (PVC) tubing of the standard or Amberset, losses were significant within 4 hours; at 48 hours, losses were 42 to 44%.<sup>1378</sup>

Vinblastine sulfate (Lilly) 10 mg/250 mL in dextrose 5% and sodium chloride 0.9%, in PVC bags at 22°C with protection from light, was infused over 2 hours at 2.08 mL/min through PVC sets. No loss due to sorption was found.<sup>1631</sup>

Vinblastine sulfate (Lederle) 250 mcg/mL in sodium chloride 0.9% exhibited no loss due to sorption to PVC and polyethylene administration lines during simulated infusions at 0.875 mL/hr for 2.5 hours via a syringe pump.<sup>1795</sup>

### Filtration

Vinblastine sulfate (Lilly) 10 mg/50 mL in dextrose 5% and sodium chloride 0.9%, filtered at a rate of about 3 mL/min through a 0.22- $\mu$ m cellulose ester membrane filter (Ivex-2), showed no significant reduction due to binding to the filter.<sup>533</sup>

Vinblastine sulfate 10 to 300 mcg/mL exhibited no loss due to sorption to either cellulose nitrate/cellulose acetate ester (Millex OR) or Teflon (Millex FG) filters.<sup>1415 1416</sup>

Vinblastine sulfate (Lederle) 250 mcg/mL in sodium chloride 0.9% exhibited no loss due to sorption to cellulose acetate (Minisart 45, Sartorius) and polysulfone (Acrodisc 45, Gelman) filters. However, a 10 to 20% loss due to sorption occurred during the first 30 to 60 minutes of infusion through nylon filters (Nylaflo, Gelman, and Utipore, Pall). About a 30% loss was found during the first hour using a positively-charged nylon filter (Posidyne ELD96, Pall). The delivered concentrations gradually returned to the full concentrations within 2 to 2.5 hours.<sup>1795</sup>

### Central Venous Catheter

Vinblastine sulfate (Lilly) 0.12 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

# Vincristine Sulfate

## AHFS 10:00

### Products

Vincristine sulfate is available as a preservative-free solution in a 1-mg/mL concentration with mannitol 100 mg/mL and sulfuric acid or sodium hydroxide to adjust pH during manufacturing.<sup>2947</sup> The ready-to-use solution is available in 1- and 2-mL single-dose vials.<sup>2947</sup> **CAUTION: Care should be taken to ensure that the correct drug product, dose, and administration procedures are used and that no confusion with other products occurs.**

### pH

The official pH range is 3.5 to 5.5.<sup>17</sup> A narrower range of pH 4 to 5 has been cited by a manufacturer.<sup>2947</sup>

### Administration

**CAUTION: Care should be taken to ensure that the correct drug product, dose, and administration procedures are used and that no confusion with other products occurs.**

Vincristine sulfate is administered intravenously only.<sup>2947</sup> It should not be given by any other route.<sup>2947</sup> Vincristine sulfate should be diluted with a suitable infusion solution in a flexible plastic container and prominently labeled "for intravenous use only" to reduce the risk of fatal medication errors due to the incorrect route of administration.<sup>2947</sup> If the drug is prepared in a syringe, a sticker is provided in the vincristine sulfate package that must be affixed directly to the syringe containing the individual dose that states:

**FOR INTRAVENOUS USE ONLY – FATAL IF GIVEN BY OTHER ROUTES.**<sup>2947</sup>

In addition, the syringe containing the prepared dose must be enclosed in an overwrap that is labeled:

**DO NOT REMOVE COVERING UNTIL MOMENT OF INJECTION.**<sup>2947</sup>

**FOR INTRAVENOUS USE ONLY – FATAL IF GIVEN BY OTHER ROUTES.**<sup>2947</sup>

The drug should be administered over 1 minute either directly into a vein or into the tubing of a running infusion solution.<sup>2947</sup> It also has been diluted and administered as an intermittent or continuous intravenous infusion.<sup>4</sup> Extravasation should be avoided.<sup>2947</sup>

In the event of spills or leaks, sodium hypochlorite 5% (household bleach) has been used to inactivate vincristine sulfate.<sup>1200</sup>

### Stability

The ready-to-use solution should be stored under refrigeration, kept upright, and protected from light.<sup>2947</sup> Unused drug solution should be discarded.<sup>2947</sup> The pH range of maximum stability is 4 to 6.<sup>1195</sup> Precipitation may occur at alkaline pH values.<sup>1369</sup> Vincristine sulfate should not be added to solutions that would raise or lower the pH outside the 3.5 to 5.5 range.<sup>2947</sup> Only dextrose or sodium chloride 0.9% are recommended.<sup>2947</sup>

Admixtures containing doxorubicin hydrochloride, etoposide phosphate, and vincristine sulfate in a variety of concentration combinations in sodium chloride 0.9% were unable to pass the USP test for antimicrobial growth effectiveness. Mixtures of these drugs are not "self-preserving" and will permit microbial growth.<sup>2343</sup>

Immersion of a needle with an aluminum component in vincristine sulfate 1 mg/mL resulted in no visually apparent reaction after 7 days at 24°C.<sup>988</sup>

### Freezing Solutions

Vincristine sulfate (Lilly) 20 mcg/mL in dextrose 5%; Ringer's injection, lactated; and sodium chloride 0.9% underwent no degradation after 4 weeks when frozen at –20°C.<sup>1195</sup>

### Syringes

Vincristine sulfate (Lilly) 0.5, 1, 2, and 3 mg diluted to 20 mL with sodium chloride 0.9% and packaged in 30-mL polypropylene syringes (Becton Dickinson) was stored for 7 days at 4°C followed by 2 days at 23°C. All samples remained physically compatible with no increase in measured turbidity or particle content. No loss occurred after 7 days at 4°C and not more than 5% loss after 2 additional days at room temperature.<sup>2350</sup>

### Sorption

Vincristine sulfate 2 mg/250 mL in dextrose 5% or sodium chloride 0.9% in polyvinyl chloride (PVC) bags at 22°C with protection from light was infused over 2 hours at 2.08 mL/min through PVC sets. No loss due to sorption was found.<sup>1631</sup>

Vincristine sulfate 25 mcg/mL in sodium chloride 0.9% exhibited no loss due to sorption to a polyethylene administration line (Vygon) during simulated infusions at 0.875 mL/hr for 2.5 hours via a syringe pump. However, about a 9% loss of delivered concentration due to sorption occurred during the first hour using a PVC administration line (Baxter). The delivered concentration returned to the full concentration within 1.5 hours.<sup>1795</sup>

### Filtration

Vincristine sulfate (Lilly) 1 mg/50 mL in dextrose 5% and sodium chloride 0.9% was filtered at about 3 mL/min through a 0.22- $\mu$ m cellulose ester membrane filter (Ivex-2). Losses of vincristine sulfate due to binding to the filters were noted in both solutions. In dextrose 5%, about 6.5% of the vincristine sulfate was bound; about 12% of the drug was lost from the sodium chloride 0.9% solution.<sup>533</sup>

In static equilibrium experiments, 100 mg of 0.22- $\mu$ m cellulose ester membrane filter (Ivex-2) was soaked in 25 mL of vincristine sulfate (Lilly) 10 and 20 mcg/mL in both dextrose 5% and sodium chloride 0.9%. The higher concentration exhibited about 20 to 30% binding to the filter in 24 to 48 hours. The lower concentration had about 30 to 45% binding in the same period.<sup>533</sup>

A filter material specially treated with a proprietary agent was evaluated for a reduction in vincristine sulfate binding. Vincristine sulfate (Lilly) 1 mg/50 mL in dextrose 5% and sodium chloride 0.9% was run through an administration set with a treated 0.22- $\mu$ m cellulose ester inline filter at a rate of 3 mL/min. Cumulative vincristine sulfate losses of about 1% occurred from both solutions compared to the much higher losses previously reported for untreated cellulose ester filter material. Furthermore, equilibrium binding studies showed 5- and 7-fold reductions in binding from dextrose 5% and sodium chloride 0.9%, respectively.<sup>904</sup> All Abbott Ivex integral filter and extension sets use this treated filter material.<sup>1074</sup>

Vincristine sulfate 1.5 mg/3 mL was injected through a 0.2- $\mu$ m nylon, air-eliminating, filter (Ultipor, Pall) to evaluate the effect of filtration on simulated intravenous push delivery. About 90% of the drug was delivered through the filter after flushing with 10 mL of sodium chloride 0.9%.<sup>809</sup>

Vincristine sulfate 10 to 200 mcg/mL exhibited a 10 to 15% loss due to sorption to both cellulose nitrate/cellulose acetate ester (Millex OR) and Teflon (Millex FG) filters.<sup>1415 1416</sup>

Vincristine sulfate (David Bull Laboratories) 250 mcg/mL in sodium chloride 0.9% exhibited little loss due to sorption to cellulose acetate (Minisart 45, Sartorius) and polysulfone (Acrodisc 45, Gelman) filters. However, a 5 to 20% loss due to sorption occurred during the first 30 to 60 minutes of infusion through nylon filters (Nylaflo, Gelman, and Utipore, Pall). About a 20 to 25% loss was found during the first hour using a nylon filter (Posidyne ELD96, Pall). The delivered concentrations gradually returned to the full concentrations within 2 to 2.5 hours.<sup>1795</sup>

### Central Venous Catheter

Vincristine sulfate (Lilly) 0.05 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

## Vincristine Sulfate Liposomal

### AHFS 10:00

#### Products

Vincristine sulfate liposomal injection is prepared from a kit containing single-use vials of vincristine sulfate solution (5 mg/5 mL), sphingomyelin-cholesterol liposome suspension (1 mL), and sodium phosphate solution (25 mL).<sup>3024</sup> **CAUTION: Care should be taken to ensure that the correct drug product, dose, and administration procedures are used and that no confusion with other products occurs.**

When prepared as directed from the kit components, the resultant product is a white to off-white translucent suspension containing liposome-encapsulated vincristine sulfate 0.16 mg/mL (i.e., 5 mg in a total volume of 31 mL of suspension).<sup>3024</sup> Each vial of vincristine sulfate liposomal injection prepared from the kit components also contains mannitol 500 mg, sphingomyelin 73.5 mg, cholesterol 29.5 mg, sodium citrate 36 mg, citric acid 38 mg, sodium phosphate 355 mg, and sodium chloride 225 mg in 31 mL of suspension.<sup>3024</sup> Over 95% of the vincristine sulfate in the resulting liposomal suspension is provided inside liposome carriers (mean diameter 100 nm), which are composed of sphingomyelin and cholesterol.<sup>3024</sup>

To prepare vincristine sulfate liposomal injection, a water bath should be prepared and maintained *outside* of the sterile area using equipment provided by the manufacturer (i.e., water bath, calibrated thermometer and timer).<sup>3024</sup> The depth of the water bath should be at least 8 cm and the temperature of the water bath should be maintained at 63 to 67°C throughout the preparation procedure.<sup>3024</sup> All steps required to mix and dilute the product should be performed *inside* the sterile area.<sup>3024</sup>

Each vial of the kit should be visually inspected for particulate matter and discoloration prior to use whenever solution and container permit; vials should not be used if a precipitate or foreign matter is present.<sup>3024</sup> A venting needle (or other suitable venting device) with a 0.2- $\mu$ m filter should be inserted into the vial of sodium phosphate solution, taking care to position the venting needle well above the liquid level of the solution prior to addition of the other components.<sup>3024</sup> One mL should be withdrawn from the vial of sphingomyelin-cholesterol liposome injection and transferred to the vial containing sodium phosphate solution.<sup>3024</sup> Five mL of solution should then be withdrawn from the vial containing vincristine sulfate and transferred to the vial containing the sodium phosphate and sphingomyelin-cholesterol liposome components.<sup>3024</sup> The venting needle should then be removed from the sodium phosphate vial and the vial should be gently inverted 5 times to mix the 3 components; shaking should be avoided.<sup>3024</sup>

After confirming that the temperature of the water bath has warmed to 63 to 67°C, the neck of the sodium phosphate vial containing the mixture of the 3 components should be fitted with the flotation ring and transferred from the sterile area to the water bath.<sup>3024</sup> The vial should remain in the water bath for

10 minutes; the temperature of the water bath and duration of flotation should be closely monitored using the manufacturer-provided calibrated thermometer and electronic timer.<sup>3024</sup> After 10 minutes, the vial should be removed from the water bath using tongs to prevent burns, and the flotation ring should be removed from the vial.<sup>3024</sup> The start time and temperature and the end time and temperature should be recorded on the provided vincristine sulfate liposomal injection overlabel immediately after the vial is placed into the water bath and upon removal, respectively.<sup>3024</sup> The vial exterior should be dried with a clean paper towel upon removal from the water bath, and the vincristine sulfate liposomal injection overlabel should be affixed.<sup>3024</sup> The vial should be gently inverted another 5 times to mix the contents; shaking should be avoided.<sup>3024</sup> The resultant vincristine sulfate liposomal injection should be allowed to equilibrate to controlled room temperature (i.e., 15 to 30°C) for at least 30 minutes.<sup>3024</sup>

Vincristine sulfate liposomal injection must be diluted in an appropriate infusion solution (i.e., dextrose 5% or sodium chloride 0.9%) before administration.<sup>3024</sup> A volume equivalent to the volume of the appropriate dose of vincristine sulfate liposomal should be withdrawn from a 100-mL infusion bag of dextrose 5% or sodium chloride 0.9% prior to addition of the drug.<sup>3024</sup> The appropriate dose of vincristine sulfate liposomal injection should then be transferred to the infusion bag to yield a final volume of 100 mL; the infusion bag label supplied by the drug's manufacturer should be completed and affixed to the bag.<sup>3024</sup>

Specific product labeling should be consulted for additional details on the preparation process for liposomal vincristine sulfate injection.<sup>3024</sup> Deviations from temperature control, timing, and preparation instructions may affect encapsulation of vincristine sulfate into the liposomes.<sup>3024</sup> In the case of such deviations, the manufacturer recommends discarding the components of the kit and using a new kit to prepare vincristine sulfate liposomal injection.<sup>3024</sup>

#### Trade Name(s)

Marqibo

#### Administration

Vincristine sulfate liposomal injection is administered by intravenous infusion over 1 hour only after preparation of the liposomal suspension as directed (see Products), followed by dilution in dextrose 5% or sodium chloride 0.9%.<sup>3024</sup> **The manufacturer states that the drug is fatal if given by other routes.<sup>3024</sup> Death has occurred with intrathecal use; such use is contraindicated.<sup>3024</sup>**

**CAUTION: Care should be taken to ensure that the correct drug product, dose, and administration procedures are used and that no confusion with other products occurs.**

## Stability

All intact vials of vincristine sulfate injection solution, sphingomyelin-cholesterol liposome injection suspension, and sodium phosphate injection solution contained in the kit used in the preparation of vincristine sulfate liposomal injection should be stored at 2 to 8°C and should not be frozen.<sup>3024</sup>

Following constitution, vincristine sulfate liposomal injection should be stored at 15 to 30°C for no more than 12 hours.<sup>3024</sup> Once

diluted in the infusion bag, administration of diluted vincristine sulfate liposomal injection should be completed within 12 hours of *initiation* of vincristine sulfate liposomal injection preparation.<sup>3024</sup>

## Filtration

Although a venting needle (or other suitable venting device) with a 0.2- $\mu$ m filter should be used in the preparation of vincristine sulfate liposomal injection, inline filters should *not* be used during administration.<sup>3024</sup>

# Vinorelbine Tartrate

## AHFS 10:00

### Products

Vinorelbine tartrate is available in a 10-mg/mL concentration in water for injection in 1- and 5-mL single-use vials. No preservatives or other additives are present.<sup>1(7/05)</sup>

Vinorelbine tartrate should be diluted with a compatible diluent for administration. Because skin reactions may occur, gloves should be worn during preparation.<sup>1(7/05)</sup>

### pH

The injection has a pH of approximately 3.5.<sup>1(7/05)</sup>

### Administration

Vinorelbine tartrate is administered intravenously, after dilution, from a syringe (at a concentration of 1.5 to 3 mg/mL) or infusion solution minibag (at a concentration of 0.5 to 2 mg/mL) over 6 to 10 minutes into the side port of a free-flowing infusion solution closest to the infusion container. After administration, 75 to 125 mL of solution should be used as a flush. Extravasation should be avoided due to tissue irritation, necrosis, and thrombophlebitis.<sup>1(7/05)</sup> A literature review for the period 1966 through 2004 did not find a statistically significant difference in the rate of venous irritation from 1- to 2-minute intravenous pushes and 6- to 10-minute intravenous infusions.<sup>2637</sup>

Intrathecal injection of vinca alkaloids has resulted in death. When vinorelbine tartrate is dispensed in a syringe containing an individual dose, the syringe must be labeled with this statement:<sup>1(7/05)</sup>

**WARNING – FOR IV USE ONLY. FATAL if given intrathecally.**

### Stability

Vinorelbine tartrate injection is a colorless to pale yellow clear solution. Intact vials should be refrigerated at 2 to 8°C and protected from light (by storage in the carton) and freezing. Intact vials are stable at room temperature (up to 25°C) for 72 hours.<sup>1(7/05)</sup>

When diluted to 1.5 to 3 mg/mL in polypropylene syringes or to 0.5 to 2 mg/mL in polyvinyl chloride (PVC) infusion containers, vinorelbine tartrate is stable for 24 hours at 5 to 30°C with exposure to normal room light.<sup>1(7/05)</sup>

Vinorelbine tartrate 0.1 mg/mL diluted in sodium chloride 0.9% and stored at 22°C did not exhibit an antimicrobial effect on the growth of 4 organisms (*Enterococcus faecium*, *Staphylococcus aureus*, *Pseudomonas aeruginosa*, and *Candida albicans*) inoculated into the solution. The author recommended that diluted solutions of vinorelbine tartrate be stored under refrigeration whenever possible and that the potential for microbiological growth be considered when assigning expiration periods.<sup>2160</sup>

### Sorption

Vinorelbine tartrate was shown not to exhibit sorption to PVC bags and tubing as well as polyethylene and glass containers.<sup>1631</sup>

2420 2430

## Vitamin A

### AHFS 88:04

### Products

Vitamin A 50,000 international units/mL is available in 2-mL single-dose vials. Each mL also contains polysorbate 80, chlorobutanol, citric acid, and sodium hydroxide to adjust pH.<sup>1(4/05)</sup>

### pH

From 6.5 to 7.1.<sup>4</sup>

### Trade Name(s)

Aquasol A Parenteral

### Administration

Vitamin A is administered intramuscularly.<sup>1(4/05)</sup> <sup>4</sup> Intravenous administration is not recommended.<sup>1(4/05)</sup>

### Stability

Vitamin A is a light yellow to amber or red oil. It is sensitive to, and should be protected from, light and air.<sup>4</sup> Intact vials should be stored under refrigeration and protected from light and freezing.<sup>1(4/05)</sup> <sup>4</sup> Although refrigerated storage is required, the manufacturer has stated the drug may be stored at room temperature for 4 weeks.<sup>2745</sup>

The stability of retinol palmitate and tocopherols ( $\delta$ ,  $\gamma$ , and  $\alpha$ ) in 3-in-1 admixtures of amino acids 4%, dextrose 10%, fat emulsion 3% (Intralipid, Liposyn, and ClinOleic), various electrolytes, vitamins, and trace elements in ethylene vinyl acetate (EVA) bags over 3 days at 4, 25, and 37°C was determined. Retinol palmitate was unstable at room temperature with 33 and 50% degradation at 24 and 72 hours after compounding, respectively. Refrigeration of the admixture reduced the degradation to 29% at 72 hours.<sup>2460</sup>

The degradation of vitamins A, B<sub>1</sub>, C, and E from Cernevit (Roche) multivitamins was evaluated in NuTRIFlex Lipid Plus (B. Braun) admixtures prepared in ethylene vinyl acetate (EVA) bags and in multilayer bags. After storage for up to 72 hours at 4, 21, and 40°C, greater vitamin losses occurred in the EVA bags. Vitamin A (retinyl palmitate) losses were 20%. In the multilayer bags (presumably a better barrier to oxygen transfer), vitamin A (retinyl palmitate) losses were 5%.<sup>2618</sup>

The vitamins in Cernevit (Baxter) diluted in three 2-in-1 parenteral nutrition admixtures were tested for stability over 48 hours. Most of the other vitamins, including vitamin A, retained their initial concentrations.<sup>2796</sup>

### Light Effects

A parenteral nutrition solution in glass bottles exposed to sunlight was evaluated. Vitamin A decomposed rapidly, losing more than 50% in 3 hours. The decomposition could be slowed to approximately a 25% loss in 3 hours by covering the bottle with a light-resistant vinyl bag.<sup>1040</sup>

Vitamin A was rapidly and significantly decomposed when exposed to daylight. The extent and rate of loss were dependent on the degree of exposure to daylight which, in turn, depended on various factors such as the direction of the radiation, time of day, and climatic conditions. Delivery of less than 10% of the expected amount was reported.<sup>1047</sup> In controlled light experiments, the decomposition initially progressed exponentially. Subsequently, the rate of decomposition slowed. This result was attributed to a protective effect of the degradation products on the remaining vitamin A. The presence of amino acids provided greater protection. Compared to degradation rates in dextrose 5%, decomposition was reduced by up to 50% in some amino acid mixtures.<sup>1048</sup>

In a parenteral nutrition solution composed of amino acids, dextrose, electrolytes, trace elements, and multivitamins in polyvinyl chloride (PVC) bags stored at 4 and 25°C, vitamin A rapidly deteriorated to 10% of the initial concentration in 8 hours at 25°C while exposed to light. The decomposition was slowed by light protection and refrigeration, with a loss of about 25% in 4 days.<sup>1063</sup>

Substantial loss of retinol all-*trans* palmitate was reported from both TPN and TNA admixtures due to exposure to sunlight. In 3 hours' exposure to sunlight, essentially total loss of retinol had occurred. The presence or absence of lipids did not affect stability. The container material used to store the nutrition admixtures affected the concentration of the vitamins as well. Losses were greatest in PVC containers and were slightly better in EVA and glass containers.<sup>2049</sup>

The photodegradation of vitamin A in 2-in-1 (Synthamin 9, Glucose 20%) and 3-in-1 (Synthamin 9, Glucose 20%, Intralipid 20%, electrolytes, vitamins, trace elements) admixtures was reported after exposure to 6 hours of indirect daylight. The compounded admixtures were prepared in multilayer bags protected from light and stored at 5°C for a minimum of 5 days. The same admixtures were prepared in EVA bags 24 hours prior to use with vitamins added prior to study. Vitamin A decreased to 60 to 80% of the initial concentrations in 2 to 6 hours. The type of bag had no influence on the photodegradation of vitamin A. Despite fat emulsion, no significant light protection was noted with the 3-in-1 admixture. The authors concluded that light protection can minimize vitamin A losses.<sup>2459</sup>

### Sorption

Vitamin A (as the acetate) (Sigma) 7.5 mg/L displayed 66.7% sorption to a PVC plastic test strip in 24 hours. The presence of dextrose 5% and sodium chloride 0.9% increased the extent of sorption.<sup>12</sup>

Vitamin A acetate displayed 78% sorption to 200-mL PVC containers after 24 hours at 25°C with gentle shaking. The initial concentration was 3 mg/L. The sorption was increased by approximately 10% in sodium chloride 0.9% and by 20% in dextrose 5%.<sup>133</sup>

However, vitamin A delivery is also reduced in glass intravenous containers. At a concentration of 10,000 units/L in glass and PVC plastic containers protected from light with aluminum foil, 77 and 71%, respectively, of the vitamin A were delivered in 10 hours. Without light protection, 61% was delivered from glass and 49% from PVC plastic containers over a 10-hour period.<sup>290</sup>

In another test using multivitamin infusion (USV), 1 ampul/L of sodium chloride 0.9% in glass and PVC containers not protected from light, 69.4 and 67.9% of the vitamin A were delivered from the glass and PVC containers, respectively, in 10 hours. The amount of vitamin A was constant over this test period, not decreasing with time.<sup>282</sup>

The delivery of vitamins A, D, and E from a parenteral nutrition solution composed of 3% amino acid solution (Pharmacia) in dextrose 10% with electrolytes, trace elements, vitamin K, folate, and vitamin B<sub>12</sub> was evaluated. To this solution was added 6 mL of multivitamin infusion (USV). The solution was prepared in PVC bags (Travenol), and administration was simulated through a fluid chamber (Buretrol) and infusion tubing with a 0.5- $\mu$ m filter at 10 mL/hr. During the first 60 to 90 minutes, minimal delivery of the vitamins occurred. Then a rise and a plateau in the delivered vitamins followed and were attributed to an increasing saturation of adsorptive binding sites in the tubing. Total amounts delivered over 24 hours were: vitamin A, 31%; vitamin D, 68%; and vitamin E, 64%. Sorption of the vitamins was found in the PVC bag, fluid chamber, and tubing. Decomposition was not a factor.<sup>836</sup>

A patient receiving 3000 international units of retinol daily in a parenteral nutrition solution nevertheless experienced 2 episodes of night blindness. The pharmacy prepared the parenteral nutrition solution in 1-L PVC bags in weekly batches and stored them at 4°C in the dark until use. A subsequent in vitro study showed losses of vitamin A of 23 and 77% in 3- and 14-day periods, respectively, under these conditions. About 30% of the lost vitamin A could be extracted from the PVC bag.<sup>1038</sup>

Losses of vitamin A from neonatal parenteral nutrition solutions containing multivitamins (USV) was reported. The solution was prepared in colorless glass bottles and run through an administration set with a burette (Travenol). The total loss of vitamin A was 75% in 24 hours, with about 16% as decomposition in the glass bottle. The decomposition was not noticeable during the first 12 hours, but then vitamin A levels fell rather precipitously to about one-third of the initial amount. The balance of the loss, averaging about 59%, occurred during transit through the administration set. Removal of the inline filter and treatment of the set with albumin had no effect on vitamin A delivery. The authors recommended a three- to four-fold increase in the amount of vitamin A to compensate for the losses.<sup>1039</sup>

A 50% loss of vitamin A was noted from a bottle of parenteral nutrition solution prepared with multivitamin infusion (USV) after 5.5 hours of infusion. The amount delivered through an Ivex-2 filter set was only 6.3% of the added amount. Similar quantities were found after 20 hours of infusion. A reduced light exposure and use of <sup>3</sup>H-labeled vitamin A confirmed binding to the infusion bottles and tubing.<sup>704</sup>

Solutions containing multivitamins (USV) spiked with <sup>3</sup>H-labeled retinol in intravenous tubing protected from light and agitated to simulate flow for 5 hours were evaluated. About half of the vitamin A was lost in 30 minutes, and 88 to 96% was lost in 5 hours. Hexane rinses and radioactivity determinations on the tubing accounted for the decrease in radioactivity.<sup>1049</sup>

Neonatal parenteral nutrition solutions containing multivitamins prepared in bags were delivered at 10 mL/hr through Buretrol sets (Travenol). The bags and sets were protected from light. About 26% of the vitamin A was lost before the flow was started. At 10 mL/hr, about 67% was lost from the effluent. More rapid flow reduced the extent of loss. Analysis of clinical samples of parenteral nutrition solutions showed losses of 21 to 57% after 20 hours. Because losses after 5 hours were of the same magnitude, the authors concluded that the loss occurs rapidly and is not due to gradual decomposition.<sup>1049</sup>

The stability of numerous vitamins in parenteral nutrition solutions composed of amino acids (Kabi-Vitrum), dextrose 30%, and fat emulsion 20% (Kabi-Vitrum) in a 2:1:1 ratio with electrolytes, trace elements, and both fat- and water-soluble vitamins was reported. The admixtures were stored in darkness at 2 to 8°C for 96 hours with no significant loss of retinyl palmitate.<sup>1225</sup>

When the admixture was subjected to simulated infusion over 24 hours at 20°C, either exposed to room light or light protected, or stored for 6 days in the dark under refrigeration and then subjected to the same simulated infusion, once again the retinyl palmitate did not undergo significant loss.<sup>1225</sup>

Retinol losses of 40% occurred in 2 hours and 60% in 5 hours from parenteral nutrition solutions pumped at 10 mL/hr through standard infusion sets at room temperature. The retinol concentration in the bottle remained constant while the retinol in the effluent decreased. Antioxidants had no effect. Much of the vitamin A was recoverable from hexane washings of the tubing.<sup>1050</sup>

The stability of several vitamins from M.V.I.-12 (Armour) admixed in parenteral nutrition solutions composed of different amino acid products, with or without Intralipid 10%, when stored in glass bottles and PVC bags at 25 and 5°C for 48 hours was reported. No vitamin A was lost from any formula in glass bottles, but samples in PVC containers lost as much as 35 and 60% at 5 and 25°C, respectively, in 48 hours.<sup>1431</sup>

The stability of vitamin A was studied in 2 parenteral nutrition solutions. In TPN #172 (see Appendix), a 10% loss of vitamin A palmitate occurred in about 20 days in PVC bags while no loss occurred in Buretrol chambers in 21 days at 30°C with exposure to normal ward light. In TPN #173 (see Appendix), a 10% loss of vitamin A palmitate occurred in about 12 days in both glass and PVC containers at 2 to 8°C with protection from light.<sup>1606</sup>

The effects of the fat emulsion concentration on vitamin A stability in several parenteral nutrition solutions were evaluated. Vitamin A palmitate was not absorbed into PVC containers from Intralipid 10%. Among TPN solutions with lower Intralipid contents, no correlation existed between the fat emulsion content and the extent of vitamin A loss during refrigerated storage. The fat emulsion content afforded vitamin A

some protection from decomposition due to light exposure at 30°C.<sup>1607</sup>

The quantity of retinol delivered from an M.V.I.-containing 2-in-1 parenteral nutrition solution and when M.V.I. was added to Intralipid 10% was evaluated during simulated administration through a PVC administration set. The parenteral nutrition solution was composed of amino acids 2.8%, dextrose 10%, and standard electrolytes; M.V.I. was added to yield a nominal retinol concentration of 455 mcg/150 mL. Retinol losses were about 80% of the admixed amount after being delivered through the PVC set. When M.V.I. was added to Intralipid 10% in a retinol concentration of 455 mcg/20 mL, retinol losses were reduced to about 10% of the admixed amount. The fat emulsion provided retinol protection from sorption to the PVC administration set.<sup>2027</sup>

Substantially higher amounts of retinol were found to be delivered using polyolefin administration set tubing than with PVC tubing during simulated neonatal intensive care administration. Retinol was added to a 2-in-1 parenteral nutrition solution

(TPN #206) in concentrations of 25 and 50 international units/mL and run at 4 and 10 mL/hr through 3-meter lengths of polyolefin (MiniMed) and PVC (Baxter) intravenous extension set tubing protected from light and passed through a 37°C water bath. Delivered quantities of retinol varied from 19 to 74% through the PVC tubing and 47 to 87% through the polyolefin tubing. The loss of retinol to the PVC tubing appeared to be saturable. Even so, the use of polyolefin tubing increases the amount of retinol delivered during simulated neonatal administration.<sup>2028</sup>

To minimize the importance of sorption, use vitamin A palmitate, which does not sorb as extensively to PVC,<sup>1033 1606 2026</sup> instead of the acetate. However, this change does not alter the problem of degradation from exposure to light. Alternatively, an excess of vitamin A could be used.<sup>1033</sup>

### **Plasticizer Leaching**

Vitamin A leached significant amounts of diethylhexyl phthalate (DEHP) plasticizer from PVC bags and administration set tubing.<sup>1621</sup>

## Voriconazole

AHFS 8:14.08

### Products

Voriconazole is available as a lyophilized powder in single-use (preservative-free) vials containing 200 mg of voriconazole with 3.2 g of sulfobutyl ether  $\beta$ -cyclodextrin sodium<sup>3233 3348</sup> or hydroxypropyl  $\beta$ -cyclodextrin<sup>3347</sup> and bearing a vacuum.<sup>3233 3347 3348</sup> Vial contents should be reconstituted with 19 mL of sterile water for injection, and the vial should be shaken until all of the powder is dissolved to yield 20 mL of a voriconazole 10-mg/mL solution.<sup>3233 3347 3348</sup> A 20-mL standard (non-automated) syringe should be used for reconstitution to ensure that the exact amount of sterile water for injection is added; the vial should be discarded if the vacuum does not draw the diluent into the vial.<sup>3233 3347 3348</sup>

The reconstituted solution is a concentrate that must be diluted in a compatible solution to a concentration of 0.5 to 5 mg/mL prior to intravenous administration.<sup>3233 3347 3348</sup> In order to achieve a final concentration in this range, the manufacturer recommends that a volume be removed from the infusion bag or bottle that is at least equivalent to the volume of drug to be added prior to addition of the drug.<sup>3233 3347 3348</sup>

Vfend I.V.

### Administration

Voriconazole is administered by intravenous infusion in a compatible infusion solution at a concentration between 0.5 and 5 mg/mL over 1 to 2 hours at a maximum rate of 3 mg/kg/hr.<sup>3233 3347 3348</sup> Voriconazole should *not* be administered as an intravenous bolus injection.<sup>3233 3347 3348</sup>

### Stability

Voriconazole is available as a lyophilized white to off-white cake or powder.<sup>3233 3347 3348</sup> Intact vials should be stored at controlled room temperature.<sup>3233 3347 3348</sup> Voriconazole powder reconstituted as directed is chemically and physically stable for 24 hours at 2 to 8°C; however, because no antimicrobial preservative is present, the manufacturer recommends that the drug be used immediately after reconstitution.<sup>3233 3347 3348</sup> Voriconazole solutions should be visually inspected for particulate matter and discoloration prior to administration.<sup>3233 3347 3348</sup> Vials of voriconazole are intended for single use, and any remaining drug should be discarded.<sup>3233 3347 3348</sup>

**Additional Compatibility Information****Other Drugs**

Manufacturers state that voriconazole must not be infused concomitantly with any short-term infusion of concentrated electrolytes, even if the infusions are running in separate intravenous lines or cannulas. Voriconazole may be infused at the same time as other intravenous solutions containing nonconcentrated electrolytes, but still must be infused through a separate line.<sup>3233 3347 3348</sup>

**Parenteral Nutrition Solutions**

Manufacturers state that voriconazole may be infused at the same time as parenteral nutrition solutions, but must be infused through a separate line. If a multiple-lumen catheter is used, the parenteral nutrition solution must be administered through a different port than the one used for voriconazole administration.<sup>3233 3347 3348</sup>

## Ziconotide Acetate

AHFS 28:08.92

### Products

Ziconotide acetate is available as a 100-mcg/mL solution in 1- and 5-mL single-use vials and as a 25-mcg/mL solution in 20-mL single-use vials.<sup>3167</sup> The formulation also contains L-methionine and sodium chloride excipients, but is preservative free.<sup>3167</sup>

### pH

From 4 to 5.<sup>3167</sup>

### Osmolarity

Ziconotide acetate in sodium chloride 0.9% at concentrations ranging from 0.25 to 1 mcg/mL had an osmolarity of 308 mOsm/L.<sup>3170</sup>

### Trade Name(s)

Prialt

### Administration

Ziconotide acetate is administered intrathecally either undiluted (using the 25-mcg/mL solution) or diluted (using the 100-mcg/mL solution) using a programmable implanted variable-rate microinfusion device or an external microinfusion device and catheter.<sup>3167</sup> The 100-mcg/mL solution must be diluted only in preservative-free sodium chloride 0.9%; saline solutions containing preservatives are *not* appropriate for intrathecal drug administration.<sup>3167</sup> Once an appropriate dose has been established, the 100-mcg/mL solution may be administered undiluted.<sup>3167</sup>

The drug is intended for use only with the Medtronic SynchroMed II Infusion System or the CADD-Micro Ambulatory Infusion Pump.<sup>3167</sup>

When using the Medtronic SynchroMed II Infusion System, only the undiluted 25-mcg/mL solution should be used for the initial priming of a new pump.<sup>3167</sup> Three 2-mL rinses of the internal surfaces of the new pump should be performed using the undiluted 25-mcg/mL solution.<sup>3167</sup> After performing the initial rinses of a new pump, only the undiluted 25-mcg/mL solution should be used for the first fill of the pump.<sup>3167</sup> The new pump should be refilled within 14 days of the first fill in order to ensure appropriate dose administration because of initial losses of the drug due to both sorption to titanium internal surfaces and dilution in the residual space of the pump.<sup>3167</sup> Losses resulting from these 2 factors do not occur upon subsequent refill.<sup>3167</sup> For subsequent refills, the pumps should be filled at least every 84 days if the drug is used undiluted or at least every 40 days if the drug is diluted.<sup>3167</sup> The remaining pump contents should be emptied prior to refilling.<sup>3167</sup> A Medtronic refill kit should be used to ensure aseptic transfer of the drug solution into the pump.<sup>3167</sup> The pump manufacturer's manual should be consulted for specific instructions and precautions on rinsing the reservoir, initial filling of the reservoir, refilling the reservoir, and programming the infusion system.<sup>3167</sup>

When using the CADD-Micro Ambulatory Infusion Pump, the pump initially should be filled with ziconotide acetate solution that has been diluted in preservative-free sodium chloride 0.9% to a concentration of 5 mcg/mL.<sup>3167</sup> The pump manufacturer's manual should be consulted for specific instructions and precautions on initial filling of the reservoir, refilling the reservoir or replacing the drug cartridge, and operation of the pump.<sup>3167</sup>

Ziconotide acetate injection is *not* intended for intravenous administration.<sup>3167</sup>

### Stability

Intact vials of ziconotide acetate should be stored under refrigeration and protected from light and freezing.<sup>3167</sup> Ziconotide acetate diluted in preservative-free sodium chloride 0.9% may be stored at 2 to 8°C for up to 24 hours prior to beginning the infusion.<sup>3167</sup>

### pH Effects

In a study evaluating the influence of pH and temperature on the stability of ziconotide, admixtures of ziconotide acetate, morphine sulfate, and ropivacaine hydrochloride were prepared in a range of concentrations and stored in syringes (Plastipak, BD) at 4 or 20°C or Medtronic SynchroMed II pumps at 37°C.<sup>3168</sup> The resulting pH of the admixtures was influenced by the morphine concentration and the storage temperature.<sup>3168</sup> Admixtures with lower morphine concentrations resulted in a higher pH; admixtures stored at lower temperatures resulted in a lower pH.<sup>3168</sup> Ziconotide prepared in admixtures with lower morphine concentrations and stored at 37°C demonstrated improved ziconotide stability.<sup>3168</sup> Admixtures with a pH exceeding 4.5 demonstrated improved ziconotide stability compared with admixtures with a pH less than 4.5.<sup>3168</sup>

### Ambulatory Pumps

Ziconotide acetate is intended for use with the CADD-Micro Ambulatory Infusion Pump.<sup>3167</sup>

### Implantable Pumps

Ziconotide acetate is intended for use with the Medtronic SynchroMed II Infusion System.<sup>3167</sup> The manufacturer of ziconotide states that the initial fill of a new pump with 25 mcg/mL of undiluted solution expires in 14 days; subsequent refills with undiluted 25- or 100-mcg/mL solutions of the drug expire in 84 days.<sup>3167</sup> Refills using diluted solutions prepared from the 100-mcg/mL formulation of the drug expire in 40 days.<sup>3167</sup>

In November 2012, Medtronic Neuromodulation warned that intermittent or permanent pump motor stalling due to corrosion has occurred in SynchroMed infusion systems after use of unapproved drugs and drug formulations (i.e., drugs not listed in the device's labeling, including admixtures, compounded drugs, and unapproved drug concentrations).<sup>3169</sup> Medtronic has confirmed through returned product analysis and in vitro testing that such

permanent pump motor stalling has been caused by admixtures containing drugs such as baclofen, bupivacaine, clonidine, fentanyl, hydromorphone, morphine, and sufentanil.<sup>3169</sup> Some antimicrobial or antioxidant preservatives (e.g., sodium metabisulfite) are known to cause pump damage, while some admixtures may have increased the rates of permeation of corrosive agents; admixtures with a pH of 3 or less and those requiring additives to maintain the solubility of a particular concentration also may not be compatible with the infusion system.<sup>3169</sup> Pump problems from previous use of an unapproved drug formulation may persist even if an approved drug formulation is used

subsequently.<sup>3169</sup> Medtronic states that only those drugs and drug formulations for which the SynchroMed infusion system is approved should be used to minimize the potential for damage to the internal pump components.<sup>3169</sup>

Clonidine hydrochloride and morphine sulfate powders were dissolved in ziconotide acetate (Elan) injection to yield concentrations of 2 and 35 mg/mL and 25 mcg/mL, respectively.<sup>2752</sup> Stored at 37°C in Medtronic SynchroMed II pumps, 11% ziconotide loss in 7 days, 4% clonidine loss in 20 days, and no morphine loss in 28 days occurred.<sup>2752</sup>

## Zidovudine

AHFS 8:18.08.20

### Products

Zidovudine is available in 20-mL single-use vials. Each mL of solution contains zidovudine 10 mg in water for injection. Hydrochloric acid and/or sodium hydroxide may be present to adjust the pH.<sup>1(10/06)</sup>

### pH

Approximately 5.5.<sup>1(10/06)</sup>

### Trade Name(s)

Retrovir

### Administration

Zidovudine must be diluted in dextrose 5% to a concentration no greater than 4 mg/mL prior to administration. The drug is administered by intravenous infusion at a constant rate over

1 hour.<sup>1(10/06)</sup> <sup>4</sup> Zidovudine also has been administered by continuous intravenous infusion.<sup>4</sup> Intramuscular injection, intravenous bolus, and rapid intravenous infusion should be avoided.<sup>1(10/06)</sup> <sup>4</sup>

### Stability

Intact vials of zidovudine should be stored at 15 to 25°C and protected from light.<sup>1(10/06)</sup>

### Central Venous Catheter

Zidovudine (Glaxo Wellcome) 1 mg/mL in dextrose 5% was found to be compatible with the ARROWg+ard Blue Plus (Arrow International) chlorhexidine-bearing triple-lumen central catheter. Essentially complete delivery of the drug was found with little or no drug loss occurring. Furthermore, chlorhexidine delivered from the catheter remained at trace amounts with no substantial increase due to the delivery of the drug through the catheter.<sup>2335</sup>

## Ziv-aflibercept

### AHFS 10:00

### Products

Ziv-aflibercept is available as a 25-mg/mL concentrate for injection in single-use vials containing 100 or 200 mg of the drug.<sup>2877</sup> Each vial also contains polysorbate 20 0.1%, sodium chloride 100 mM, sodium citrate 5 mM, sodium phosphate 5 mM, and sucrose 20% in water for injection.<sup>2877</sup> The concentrate must be diluted before administration.<sup>2877</sup>

### pH

6.2<sup>2877</sup>

### Trade Name(s)

Zaltrap

### Administration

Ziv-aflibercept is administered by intravenous infusion over one hour following dilution in a compatible diluent to a concentration of 0.6 to 8 mg/mL.<sup>2877</sup> The diluted drug should be administered through a 0.2- or 0.22- $\mu$ m inline polyethersulfone filter.<sup>2877 2878</sup> Ziv-aflibercept should *not* be administered as a bolus or push intravenous injection.<sup>2877</sup>

### Stability

Ziv-aflibercept concentrate is a clear, colorless to pale yellow solution.<sup>2877</sup> Intact vials should be stored under refrigeration and kept in the original outer carton to protect from light.<sup>2877</sup>

Visually inspect ziv-aflibercept before use.<sup>2877</sup> Discard if the solution is cloudy, contains particles, or is discolored.<sup>2877</sup>

Single-use vials of ziv-aflibercept do not contain any preservatives.<sup>2877</sup> After the appropriate dose has been withdrawn from the vial upon initial puncture, the vial should not be re-entered, and any unused portion should be discarded.<sup>2877</sup>

Diluted solutions of ziv-aflibercept should be prepared in infusion containers composed of either PVC (containing either diethylhexyl phthalate [DEHP] or trioctyl trimellitate [TOTM]) or polyolefin (e.g., polypropylene, polyethylene).<sup>2877 2878</sup> Ziv-aflibercept should *not* be prepared in infusion containers composed of ethylene vinyl acetate (EVA).<sup>2878</sup>

Diluted solutions of ziv-aflibercept should be used immediately.<sup>2878</sup> Admixtures not used immediately should be refrigerated for up to 4 hours.<sup>2877</sup> Any unused portion remaining in the infusion bag following administration should be discarded.<sup>2877</sup>

### Light Effects

Ziv-aflibercept concentrate is light sensitive.<sup>2878</sup> Vials of the concentrate should be stored in the original outer carton to protect from light.<sup>2877</sup> The manufacturer does not specify a need for protecting the diluted solution from light.<sup>2878</sup>

### Sorption

No substantial changes in the quality or potency of the drug were noted when diluted solutions of ziv-aflibercept (0.6 to 8 mg/mL) were tested with infusion sets composed of DEHP-plasticized PVC, TOTM-plasticized PVC, polyethylene-lined PVC, or polypropylene.<sup>2877 2878</sup> Infusion sets composed of polyurethane also were found to be compatible.<sup>2877 2878</sup>

### Filtration

For ziv-aflibercept administration, the manufacturer recommends the use of either a 0.2- or 0.22- $\mu$ m inline polyethersulfone filter.<sup>2878</sup> Filters composed of polyvinylidene fluoride or nylon were noted to facilitate adsorption during stability testing<sup>2878</sup> and should not be used.<sup>2877</sup>

## Zoledronic Acid

### AHFS 92:24

#### Products

Zoledronic acid is available as a ready-to-use solution in single-use bottles<sup>3140</sup> and bags<sup>3142 3143</sup> and as a concentrate for injection in 5-mL single-use vials<sup>3140</sup> containing the equivalent of 4 mg of zoledronic acid.<sup>3140 3142 3143</sup>

Each 100-mL bottle of zoledronic acid (Zometa<sup>®</sup>; Novartis) ready-to-use solution also contains mannitol 5100 mg and sodium citrate 24 mg in water for injection.<sup>3140</sup> 100-mL bags of ready-to-use solution from other manufacturers also contain sodium chloride 900 mg, mannitol 220 mg, and sodium citrate 24 mg to adjust the pH in water for injection.<sup>3142 3143</sup> Some bottles and bags also contain overfill.<sup>3140 3142</sup>

Vials of zoledronic acid concentrate for injection also contain mannitol 220 mg and sodium citrate 24 mg in water for injection.<sup>3140</sup> The appropriate dose of the concentrate must be withdrawn from the vial and diluted in 100 mL of sodium chloride 0.9% or dextrose 5% immediately prior to administration.<sup>3140</sup> Vials contain overfill to allow for withdrawal of 5 mL of concentrate.<sup>3140</sup>

Zoledronic acid also is available as a lyophilized powder in single-use vials containing the equivalent of 4 mg zoledronic acid.<sup>3141</sup> Each vial also contains mannitol 220 mg and sodium citrate dihydrate to adjust the pH.<sup>3141</sup> Each vial is packaged with an ampul of diluent containing 5 mL of sterile water for injection.<sup>3141</sup> The powder should be reconstituted by adding 5 mL of the diluent to the vial.<sup>3141</sup> Once the vial contents are completely dissolved, the appropriate dose of the resulting concentrate should be withdrawn from the vial with a syringe and further diluted in 100 mL of sodium chloride 0.9% or dextrose 5%.<sup>3141</sup>

Zoledronic acid also is available as a ready-to-use solution in single-use 100-mL bottles<sup>3139</sup> or bags<sup>3144</sup> containing the equivalent of 5 mg of zoledronic acid.<sup>3139 3144</sup> Each bottle or bag also contains mannitol 4950 mg and sodium citrate 30 mg.<sup>3139 3144</sup>

#### Equivalency

Zoledronic acid 4.264 mg as the monohydrate is equivalent to 4 mg of zoledronic acid.<sup>3140 3141</sup> Zoledronic acid 5.33 mg as the monohydrate is equivalent to 5 mg of zoledronic acid.<sup>3139</sup>

#### pH

Ready-to-use solutions of zoledronic acid 4 mg in 100 mL (Sagent) have a pH from 5.5 to 6.5.<sup>3142</sup> Ready-to-use solutions of zoledronic acid 5 mg in 100 mL have a pH from 6 to 7.<sup>3139</sup>

The reconstituted zoledronic acid concentrate for injection has a pH from 5.7 to 6.7.<sup>3141</sup>

#### Trade Name(s)

Reclast, Zometa

#### Administration

Zoledronic acid concentrate for injection (commercially available or prepared by reconstituting the lyophilized powder) must be diluted prior to administration.<sup>3140 3141</sup>

Ready-to-use solutions may be administered directly without further preparation.<sup>3140 3142</sup> To prepare reduced doses of zoledronic acid (Zometa<sup>®</sup>) using the 4-mg ready-to-use solution, 12, 18, or 25 mL of the solution should be withdrawn from the container and discarded to yield a zoledronic acid dose of 3.5, 3.3, or 3 mg, respectively; a volume equal to that removed should then be replaced with sodium chloride 0.9% or dextrose 5%.<sup>3140</sup> Another manufacturer (Hospira) recommends that such volumes be removed from the 4-mg container of ready-to-use solution using an intravenous bag transfer device and discarded and that the premixed bag then be labeled to reflect the final drug content and total fluid volume remaining in the container.<sup>3143</sup> The manufacturers of the 5-mg ready-to-use solutions of zoledronic acid do not provide recommendations for preparation of reduced doses.<sup>3139 3144</sup>

Zoledronic acid solution is administered intravenously over a period of at least 15 minutes.<sup>3139 3140 3141</sup> If solutions for infusion have been refrigerated, the solution should be allowed to come to room temperature prior to administration.<sup>3139 3140 3141</sup>

Zoledronic acid should be infused through a separate vented infusion line.<sup>3139 3140 3141</sup> The manufacturers of Reclast<sup>®</sup> (Novartis) and those of corresponding generic formulations recommend that the line should be flushed with at least 10 mL of sodium chloride 0.9% following infusion of zoledronic acid solution.<sup>3139 3144</sup> Zoledronic acid solution must not be mixed with or allowed to contact calcium or any other solutions containing divalent cations (e.g., Ringer's injection, lactated).<sup>3139 3140 3141</sup>

#### Stability

Most intact vials, bottles, and bags should be stored at controlled room temperature.<sup>3139 3140 3141</sup> Intact ampuls of the diluent provided with the lyophilized powder also should be stored at controlled room temperature.<sup>3141</sup> One manufacturer (Hospira) recommends that the ready-to-use solution of zoledronic acid 4 mg in 100-mL bags be stored at temperatures not exceeding 30°C and not be frozen.<sup>3143</sup> Specific product labeling should be consulted for additional storage details.

If not used immediately after dilution, solutions diluted for infusion and reduced doses prepared from a ready-to-use bottle should be stored at 2 to 8°C.<sup>3140 3141</sup> The total time from reconstitution and/or dilution to completion of administration should not exceed 24 hours.<sup>3140 3141</sup>

Zoledronic acid solution should be visually inspected for particulate matter and discoloration prior to administration.<sup>3139 3140 3141</sup> Bottles, bags, and vials are for single-use only; any unused portions of the solution should be discarded.<sup>3143 3144</sup>

#### Syringes

To avoid inadvertent injection, undiluted zoledronic acid concentrate for injection (whether commercially available or prepared by reconstituting lyophilized powder) should not be stored in syringes.<sup>3140 3141</sup>

## Compatibility Information

## Appendix: Parenteral Nutrition Formulas

The following tables summarize the composition of the total parenteral nutrition mixtures that are referenced throughout the *Handbook on Injectable Drugs*. Each unique formula that has been tested for stability and/or compatibility characteristics, alone or in combination with other drugs, is described and assigned a code number. These code numbers are used in the drug monographs to denote the

TNA (3-in-1) or TPN (2-in-1) formulation being discussed (i.e., TPN #183, TPN #184, etc.). The TNA and TPN formulations are described as completely as possible from the original published sources.

The consolidation of the formulations into a single appendix is designed to avoid unnecessary repetition and to facilitate comparisons among different mixtures.

## Index

Nonproprietary (generic) drug names appear in **bold type**; brand (proprietary, trade) names appear in regular type.

### A

**ABCIXIMAB**, 1  
 Abelcet, brand of **AMPHOTERICIN B LIPID COMPLEX**, 115  
 Abilify, brand of **ARIPIRAZOLE**, 155  
 Abraxane, brand of **PACLITAXEL (ALBUMIN-BOUND)**, 1228  
 Acetadote, brand of **ACETYLCYSTEINE**, 8  
**ACETAMINOPHEN**, 2  
**ACETAZOLAMIDE SODIUM**, 6  
**ACETYLCYSTEINE**, 8  
**ACTINOMYCIN D**, see **DACTINOMYCIN**, 442  
 Activase, brand of **ALTEPLASE**, 30  
**ACYCLOVIR SODIUM**, 9  
 Adenocard IV, brand of **ADENOSINE**, 15  
 Adenoscan, brand of **ADENOSINE**, 15  
**ADENOSINE**, 15  
 Adrenalin Chloride, brand of **EPINEPHRINE HYDROCHLORIDE**, 595  
 Adriamycin, brand of **DOXORUBICIN HYDROCHLORIDE**, 559  
 Advate, brand of **ANTIHEMOPHILIC FACTOR (RECOMBINANT)**, 147  
 Aggrastat, brand of **TIROFIBAN HYDROCHLORIDE**, 1502  
 Akovaz, brand of **EPHEDRINE SULFATE**, 592  
 Akynzeo, brand of **FOSNETRUPITANT CHLORIDE HYDROCHLORIDE-PALONOSETRON HYDROCHLORIDE**, 737  
 Albumarc, brand of **ALBUMIN HUMAN**, 17  
 Albuminar, brand of **ALBUMIN HUMAN**, 17  
**ALBUMIN HUMAN**, 17  
 Albuterol, brand of **ALBUMIN HUMAN**, 17  
**ALDESLEUKIN**, 20  
 Alfenta, brand of **ALFENTANIL HYDROCHLORIDE**, 23  
**ALFENTANIL HYDROCHLORIDE**, 23  
 Alimta, brand of **PEMETREXED DISODIUM**, 1245  
 Alkeran, brand of **MELPHALAN HYDROCHLORIDE**, 1005  
**ALLOPURINOL SODIUM**, 25  
 Aloprim, brand of **ALLOPURINOL SODIUM**, 25  
 Aloxi, brand of **PALONOSETRON HYDROCHLORIDE**, 1229  
**ALTEPLASE**, 30  
 AmBisome, brand of **AMPHOTERICIN B LIPOSOMAL**, 117  
 A-MethaPred, brand of **METHYLPREDNISOLONE SODIUM SUCCINATE**, 1060  
 Amidate, brand of **ETOMIDATE**, 637  
**AMIFOSTINE**, 33

**AMIKACIN SULFATE**, 37  
**AMINOCAPROIC ACID**, 80  
**AMINOPHYLLINE**, 81  
**AMIODARONE HYDROCHLORIDE**, 92  
**AMISULPRIDE**, 99  
**AMMONIUM CHLORIDE**, 100  
**AMOXICILLIN SODIUM**, 102  
**AMOXICILLIN SODIUM-CLAVULANATE POTASSIUM**, 105  
 Amoxil, brand of **AMOXICILLIN SODIUM**, 102  
 Amphadase, brand of **HYALURONIDASE**, 827  
**AMPHOTERICIN B**, 108  
**AMPHOTERICIN B LIPID COMPLEX**, 115  
**AMPHOTERICIN B LIPOSOMAL**, 117  
**AMPICILLIN SODIUM**, 119  
**AMPICILLIN SODIUM-SULBACTAM SODIUM**, 133  
**AMSACRINE**, 137  
 Amsidine, brand of **AMSACRINE**, 137  
 Amsidyl, brand of **AMSACRINE**, 137  
**ANAKINRA**, 140  
**ANDEXANET ALFA**, see **FACTOR Xa (RECOMBINANT)**, **INACTIVATED-ZHZO**, 650  
 Andexxa, brand of **FACTOR Xa (RECOMBINANT)**, **INACTIVATED-ZHZO**, 650  
 Anectine, brand of **SUCCINYLCHOLINE CHLORIDE**, 1450  
 Angiomax, brand of **BIVALIRUDIN**, 197  
**ANGIOTENSIN II ACETATE**, 141  
**ANIDULAFUNGIN ACETATE**, 143  
 Anjeso, brand of **MELOXICAM**, 1004  
**ANTIHEMOPHILIC FACTOR (RECOMBINANT)**, 147  
**ANTITHYMOCYTE GLOBULIN (RABBIT)**, 148  
 Antizol, brand of **FOMEPIZOLE**, 729  
 Anzemet, brand of **DOLASETRON MESYLATE**, 539  
 APO-go, brand of **APOMORPHINE HYDROCHLORIDE**, 150  
 Apokion, brand of **APOMORPHINE HYDROCHLORIDE**, 150  
 Apomine, brand of **APOMORPHINE HYDROCHLORIDE**, 150  
**APOMORPHINE HYDROCHLORIDE**, 150  
**APREPITANT**, 151  
 Aquasol A Parenteral, brand of **VITAMIN A**, 1587  
 Aredia, brand of **PAMIDRONATE DISODIUM**, 1232  
**ARGATROBAN**, 152  
**ARIPIRAZOLE**, 155  
**ARSENIC TRIOXIDE**, 156  
**ASCORBIC ACID**, 157

**ASPARAGINASE ERWINIA CHRYSANTHEMI**, 163  
 Astramorph PF, brand of **MORPHINE SULFATE**, 1119  
 Ativan, brand of **LORAZEPAM**, 983  
**ATRACURIUM BESYLATE**, 164  
**ATROPINE SULFATE**, 168  
 Augmentin, brand of **AMOXICILLIN SODIUM-CLAVULANATE POTASSIUM**, 105  
 Avastin, brand of **BEVACIZUMAB**, 194  
 Avelox, brand of **MOXIFLOXACIN HYDROCHLORIDE**, 1137  
 Avycaz, brand of **CEFTAZIDIME-AVIBACTAM SODIUM**, 320  
**AZACITIDINE**, 172  
 Azactam, brand of **AZTREONAM**, 179  
**AZATHIOPRINE SODIUM**, 175  
**AZITHROMYCIN**, 176  
**AZTREONAM**, 179

### B

**BACITRACIN**, 188  
**BACLOFEN**, 189  
 Bactrim, brand of **TRIMETHOPRIM-SULFAMETHOXAZOLE**, 1528  
 Barhemsys, brand of **AMISULPRIDE**, 99  
 Baxdela, brand of **DELAFLORACIN MEGLUMINE**, 461  
 Benadryl, brand of **DIPHENHYDRAMINE HYDROCHLORIDE**, 512  
**BENDAMUSTINE HYDROCHLORIDE**, 191  
 Bendeka, brand of **BENDAMUSTINE HYDROCHLORIDE**, 191  
**BENZTROPINE MESYLATE**, 193  
**BENZYL PENICILLIN POTASSIUM**, see **PENICILLIN G POTASSIUM**, 1249  
**BENZYL PENICILLIN SODIUM**, see **PENICILLIN G SODIUM**, 1258  
**BEVACIZUMAB**, 194  
 BiCNU, brand of **CARMUSTINE (BCNU)**, 260  
**BIVALIRUDIN**, 197  
 Bivigam, brand of **IMMUNE GLOBULIN HUMAN**, 883  
**BLEOMYCIN SULFATE**, 201  
**BLINATUMOMAB**, 205  
 Blyncto, brand of **BLINATUMOMAB**, 205  
 Boniva, brand of **IBANDRONATE SODIUM**, 861  
**BORTEZOMIB**, 210  
 Brevibloc, brand of **ESMOLOL HYDROCHLORIDE**, 626  
 Brevital Sodium, brand of **METHOHEXITAL SODIUM**, 1043  
**BREXANOLONE**, 211

Bridion, brand of **SUGAMMADEX SODIUM**, 1458  
**BRIVARACETAM**, 212  
 Briviact, brand of **BRIVARACETAM**, 212  
**BUMETANIDE**, 213  
 Buminate, brand of **ALBUMIN HUMAN**, 17  
**BUPIVACAINE HYDROCHLORIDE**, 216  
 Buprenex, brand of **BUPRENORPHINE HYDROCHLORIDE**, 221  
**BUPRENORPHINE HYDROCHLORIDE**, 221  
 Buscopan, brand of **SCOPOLAMINE BUTYLBROMIDE**, 1404  
**BUSULFAN**, 224  
 Busulfex, brand of **BUSULFAN**, 224  
**BUTORPHANOL TARTRATE**, 226

## C

Cafcit, brand of **CAFFEINE CITRATE**, 230  
**CAFFEINE CITRATE**, 230  
 Calcijex, brand of **CALCITRIOL**, 233  
**CALCITRIOL**, 233  
**CALCIUM CHLORIDE**, 234  
 Calcium Disodium Versenate, brand of **EDETATE CALCIUM DISODIUM**, 583  
**CALCIUM GLUCONATE**, 239  
 Caldolor, brand of **IBUPROFEN**, 862  
 Camptosar, brand of **IRINOTECAN HYDROCHLORIDE**, 914  
 Cancidas, brand of **CASPOFUNGIN ACETATE**, 263  
**CASPOFUNGIN ACETATE**, 263  
**CANGRELOR TETRASODIUM**, 251  
**CARBAMAZEPINE**, 255  
 Carbocaine, brand of **MEPIVACAINE HYDROCHLORIDE**, 1019  
**CARBOPLATIN**, 256  
 Cardene I.V., brand of **NICARDIPINE HYDROCHLORIDE**, 1163  
 Carimune NF, brand of **IMMUNE GLOBULIN HUMAN**, 883  
**CARMUSTINE (BCNU)**, 260  
 Carnexiv, brand of **CARBAMAZEPINE**, 255  
 Carnitor, brand of **LEVOCARNITINE**, 956  
**CEFAZOLIN SODIUM**, 269  
**CEFEPIME HYDROCHLORIDE**, 280  
**CEFIDEROCOL SULFATE TOSYLATE**, 287  
**CEFOTAXIME SODIUM**, 288  
**CEFOTETAN DISODIUM**, 294  
**CEFOXITIN SODIUM**, 298  
**CEFTAROLINE FOSAMIL**, 305  
**CEFTAZIDIME**, 309  
**CEFTAZIDIME-AVIBACTAM SODIUM**, 320  
**CEFTRIAZONE SODIUM**, 328  
**CEFUROXIME SODIUM**, 336  
 CellCept, brand of **MYCOPHENOLATE MOFETIL HYDROCHLORIDE**, 1145  
 Cerebyx, brand of **FOSPHENYTOIN SODIUM**, 738  
 Cerubidine, brand of **DAUNORUBICIN HYDROCHLORIDE**, 454  
**CHLORAMPHENICOL SODIUM SUCCINATE**, 342

**CHLOROTHIAZIDE SODIUM**, 348  
**CHLORPROMAZINE HYDROCHLORIDE**, 351  
 Cholografin Meglumine, brand of **IODIPAMIDE MEGLUMINE**, 904  
**CIDOFOVIR**, 357  
 Cinvanti, brand of **APREPITANT**, 151  
**CIPROFLOXACIN**, 359  
 Cipro I.V., brand of **CIPROFLOXACIN**, 359  
**CISATRACURIUM BESYLATE**, 367  
**CISPLATIN**, 373  
**CLADRIBINE**, 381  
 Claforan, brand of **CEFOTAXIME SODIUM**, 288  
 Clamoxyl, brand of **AMOXICILLIN SODIUM**, 102  
**CLARITHROMYCIN**, 384  
 Clavulin, brand of **AMOXICILLIN SODIUM-CLAVULANATE POTASSIUM**, 105  
 Cleocin Phosphate, brand of **CLINDAMYCIN PHOSPHATE**, 388  
**CLEVIDIPINE BUTYRATE**, 386  
 Cleviprex, brand of **CLEVIDIPINE BUTYRATE**, 386  
**CLINDAMYCIN PHOSPHATE**, 388  
**CLOFARABINE**, 398  
 Clolar, brand of **CLOFARABINE**, 398  
**CLONAZEPAM**, 400  
**CLONIDINE HYDROCHLORIDE**, 402  
**CLOXACILLIN SODIUM**, 406  
**CO-AMOXICLAV**, see **AMOXICILLIN SODIUM-CLAVULANATE POTASSIUM**, 105  
 Cogentin, brand of **BENZTROPINE MESYLATE**, 193  
**COLISTIMETHATE SODIUM**, 413  
 Coly-Mycin M Parenteral, brand of **COLISTIMETHATE SODIUM**, 413  
**CONIVAPTAN HYDROCHLORIDE**, 417  
 Conray, brand of **IOTHALAMATE MEGLUMINE**, 910  
 Conray 30, brand of **IOTHALAMATE MEGLUMINE**, 910  
 Conray 43, brand of **IOTHALAMATE MEGLUMINE**, 910  
 Contramal, brand of **TRAMADOL HYDROCHLORIDE**, 1519  
 Corlopam, brand of **FENOLDOPAM MESYLATE**, 676  
 Corphedra, brand of **EPHEDRINE SULFATE**, 592  
 Corvert, brand of **IBUTILIDE FUMARATE**, 866  
 Cosmegen, brand of **DACTINOMYCIN**, 442  
**CO-TRIMOXAZOLE**, see **TRIMETHOPRIM-SULFAMETHOXAZOLE**, 1528  
 Cresemba, brand of **ISAVUCONAZONIUM SULFATE**, 921  
 Cubicin, brand of **DAPTOMYCIN**, 448  
 Cubicin RF, brand of **DAPTOMYCIN**, 448  
 Cuvitru, brand of **IMMUNE GLOBULIN HUMAN**, 883

**CYANOCOBALAMIN**, 418  
**CYCLIZINE LACTATE**, 420  
**CYCLOPHOSPHAMIDE**, 423  
**CYCLOSPORINE**, 429  
 Cyklokapron, brand of **TRANEXAMIC ACID**, 1522  
**CYTARABINE**, 433  
**CYTOSINE ARABINOSIDE**, see **CYTARABINE**, 433  
 Cytovene-IV, brand of **GANCICLOVIR SODIUM**, 757

## D

**DACARBAZINE**, 439  
**DACTINOMYCIN**, 442  
**DALBAVANCIN HYDROCHLORIDE**, 444  
**DALTEPARIN SODIUM**, 445  
 Dalvance, brand of **DALBAVANCIN HYDROCHLORIDE**, 444  
 Dantrium, brand of **DANTROLENE SODIUM**, 447  
**DANTROLENE SODIUM**, 447  
**DAPTOMYCIN**, 448  
**DAUNORUBICIN-CYTARABINE LIPOSOMAL**, 452  
**DAUNORUBICIN HYDROCHLORIDE**, 454  
**DEFEROXAMINE MESYLATE**, 457  
**DEFIBROTIDE SODIUM**, 458  
 Defitelio, brand of **DEFIBROTIDE SODIUM**, 458  
**DELAFLOXACIN MEGLUMINE**, 461  
 Demerol, brand of **MEPERIDINE HYDROCHLORIDE**, 1010  
 Depacon, brand of **VALPROATE SODIUM**, 1536  
 Depo-Medrol, brand of **METHYL-PREDNISOLONE ACETATE**, 1059  
 Desferal, brand of **DEFEROXAMINE MESYLATE**, 457  
**DEXAMETHASONE SODIUM PHOSPHATE**, 462  
**DEXMEDETOMIDINE HYDROCHLORIDE**, 471  
**DEXRAZOXANE HYDROCHLORIDE**, 477  
**DEXTRAN 40**, 479  
**DIACETYLMORPHINE HCL**, see **DIAMORPHINE HYDROCHLORIDE**, 481  
**DIAMORPHINE HYDROCHLORIDE**, 481  
**DIAZEPAM**, 486  
**DICLOFENAC SODIUM**, 495  
 Diflucan, brand of **FLUCONAZOLE**, 705  
**DIGOXIN**, 496  
 Dilaudid, brand of **HYDROMORPHONE HYDROCHLORIDE**, 844  
 Dilaudid-HP, brand of **HYDROMORPHONE HYDROCHLORIDE**, 844  
**DILTIAZEM HYDROCHLORIDE**, 500  
**DIMENHYDRINATE**, 507  
**DIPHENHYDRAMINE HYDROCHLORIDE**, 512  
 Diprivan, brand of **PROPOFOL**, 1351  
**DOBUTAMINE HYDROCHLORIDE**, 520

Docefrez, brand of **DOCETAXEL**, 532  
**DOCETAXEL**, 532  
**DOLASETRON MESYLATE**, 539  
**DOPAMINE HYDROCHLORIDE**, 541  
Dopram, brand of **DOXAPRAM HYDROCHLORIDE**, 556  
Doribax, brand of **DORIPENEM**, 551  
**DORIPENEM**, 551  
**DOXAPRAM HYDROCHLORIDE**, 556  
Doxil, brand of **DOXORUBICIN HYDROCHLORIDE LIPOSOMAL**, 568  
**DOXORUBICIN HYDROCHLORIDE**, 559  
**DOXORUBICIN HYDROCHLORIDE LIPOSOMAL**, 568  
**DOXYCYCLINE HYCLATE**, 572  
**DROPERIDOL**, 577  
Duraclon, brand of **CLONIDINE HYDROCHLORIDE**, 402  
Duramorph, brand of **MORPHINE SULFATE**, 1119  
Dyloject, brand of **DICLOFENAC SODIUM**, 495

**E**

**EDETATE CALCIUM DISODIUM**, 583  
**EDROPHONIUM CHLORIDE**, 584  
Elitek, brand of **RASBURICASE**, 1381  
Ellence, brand of **EPIRUBICIN HYDROCHLORIDE**, 602  
Eloxatin, brand of **OXALIPLATIN**, 1210  
Emend, brand of **FOSAPREPITANT DIMEGLUMINE**, 730  
**ENALAPRILAT**, 585  
Enlon, brand of **EDROPHONIUM CHLORIDE**, 584  
**ENOXAPARIN SODIUM**, 590  
**EPHEDRINE SULFATE**, 592  
**EPINEPHRINE HYDROCHLORIDE**, 595  
Epipen, brand of **EPINEPHRINE HYDROCHLORIDE**, 595  
**EPIRUBICIN HYDROCHLORIDE**, 602  
**EPOETIN ALFA**, 605  
Epogen, brand of **EPOETIN ALFA**, 605  
**EPOPROSTENOL SODIUM**, 607  
**EPTIFIBATIDE**, 610  
**ERAVACYCLINE DIHYDROCHLORIDE**, 613  
Eraxis, brand of **ANIDULAFUNGIN ACETATE**, 143  
**ERIBULIN MESYLATE**, 616  
**ERTAPENEM SODIUM**, 617  
Erwinaze, brand of **ASPARAGINASE ERWINIA CHRYSANTHEMI**, 163  
Erythrocine Lactobionate-I.V., brand of **ERYTHROMYCIN LACTOBIONATE**, 620  
**ERYTHROMYCIN LACTOBIONATE**, 620  
**ESMOLOL HYDROCHLORIDE**, 626  
**ESOMEPRAZOLE SODIUM**, 632  
**ESTROGENS, CONJUGATED**, 634  
**ETHACRYNATE SODIUM**, 635  
Ethyol, brand of **AMIFOSTINE**, 33  
**ETOMIDATE**, 637

Etopophos, brand of **ETOPOSIDE PHOSPHATE**, 645  
**ETOPOSIDE**, 639  
**ETOPOSIDE PHOSPHATE**, 645  
Evoltra, brand of **CLOFARABINE**, 398  
Evomela, brand of **MELPHALAN HYDROCHLORIDE**, 1005

**F**

**FACTOR Xa (RECOMBINANT), INACTIVATED-ZHZO**, 650  
**FAMOTIDINE**, 651  
**FAT EMULSION, INTRAVENOUS**, 658  
**FENOLDOPAM MESYLATE**, 676  
**FENTANYL CITRATE**, 681  
Feraheme, brand of **FERUMOXYTOL**, 692  
**FERRIC CARBOXYMALTOSIDE**, 690  
**FERRIC DERISOMALTOSIDE**, 691  
Ferrelecit, brand of **SODIUM FERRIC GLUCONATE COMPLEX**, 1425  
**FERUMOXYTOL**, 692  
Fetroja, brand of **CEFIDEROCOL SULFATE TOSYLATE**, 287  
**FILGRASTIM**, 693  
Flanamox, brand of **AMOXICILLIN SODIUM-CLAVULANATE POTASSIUM**, 105  
Flebogamma DIF, brand of **IMMUNE GLOBULIN HUMAN**, 883  
Flolan, brand of **EPOPROSTENOL SODIUM**, 607  
**FLOXACILLIN SODIUM**, 698  
Flozapen, brand of **FLOXACILLIN SODIUM**, 698  
**FLOXURIDINE**, 702  
**FLUCLOXACILLIN SODIUM**, see **FLOXACILLIN SODIUM**, 698  
**FLUCONAZOLE**, 705  
**FLUDARABINE PHOSPHATE**, 712  
Fludara, brand of **FLUDARABINE PHOSPHATE**, 712  
**FLUMAZENIL**, 716  
**FLUOROURACIL**, 718  
**FLUPHENAZINE HYDROCHLORIDE**, 726  
**FOLIC ACID**, 727  
**FOMEPIZOLE**, 729  
Fortaz, brand of **CEFTAZIDIME**, 309  
**FOSAPREPITANT DIMEGLUMINE**, 730  
**FOSCARNET SODIUM**, 732  
Foscavir, brand of **FOSCARNET SODIUM**, 732  
**FOSNETUPITANT CHLORIDE HYDROCHLORIDE-PALONOSETRON HYDROCHLORIDE**, 737  
**FOSPHENYTOIN SODIUM**, 738  
Fragmin, brand of **DALTEPARIN SODIUM**, 445  
**FRUSEMIDE**, see **FUROSEMIDE**, 741  
Fucidin, brand of **FUSIDATE SODIUM**, 752  
Fungizone, brand of **AMPHOTERICIN B**, 108  
**FUROSEMIDE**, 741  
**FUSIDATE SODIUM**, 752  
Fusilev, brand of **LEVOLEUCOVORIN CALCIUM**, 962

**G**

Gablofen, brand of **BACLOFEN**, 189  
**GALLIUM NITRATE**, 754  
GamaSTAN S/D, brand of **IMMUNE GLOBULIN HUMAN**, 883  
Gammagard Liquid, brand of **IMMUNE GLOBULIN HUMAN**, 883  
Gammagard S/D, brand of **IMMUNE GLOBULIN HUMAN**, 883  
Gammaked, brand of **IMMUNE GLOBULIN HUMAN**, 883  
Gammalex, brand of **IMMUNE GLOBULIN HUMAN**, 883  
Gamunex-C, brand of **IMMUNE GLOBULIN HUMAN**, 883  
**GANCICLOVIR SODIUM**, 757  
Ganite, brand of **GALLIUM NITRATE**, 754  
**GEMCITABINE HYDROCHLORIDE**, 761  
Gemzar, brand of **GEMCITABINE HYDROCHLORIDE**, 761  
**GENTAMICIN SULFATE**, 766  
Giapreza, brand of **ANGIOTENSIN II ACETATE**, 141  
**GLYCOPYRROLATE**, 780  
GM-CSF, see **SARGRAMOSTIM**, 1400  
**GRANISETRON HYDROCHLORIDE**, 785  
Granocyte-13, brand of **LENOGRASTIM**, 945  
Granocyte-34, brand of **LENOGRASTIM**, 945

**H**

Halaven, brand of **ERIBULIN MESYLATE**, 616  
Haldol, brand of **HALOPERIDOL LACTATE**, 792  
**HALOPERIDOL LACTATE**, 792  
Helixate FS, brand of **ANTIHEMOPHILIC FACTOR (RECOMBINANT)**, 147  
**HEPARIN SODIUM**, 798  
Herceptin, brand of **TRASTUZUMAB**, 1524  
Hespan, brand of **HETASTARCH IN SODIUM CHLORIDE 0.9%**, 825  
**HETASTARCH IN LACTATED ELECTROLYTE**, 821  
**HETASTARCH IN SODIUM CHLORIDE 0.9%**, 825  
Hexabrix, brand of **IOXAGLATE MEGLUMINE-IOXAGLATE SODIUM**, 912  
Hextend, brand of **HETASTARCH IN LACTATED ELECTROLYTE**, 821  
Hizentra, brand of **IMMUNE GLOBULIN HUMAN**, 883  
Humalog, brand of **INSULIN LISPRO**, 901  
Humulin R, brand of **INSULIN**, 893  
**HYALURONIDASE**, 827  
Hycamtin, brand of **TOPOTECAN HYDROCHLORIDE**, 1514  
**HYDRALAZINE HYDROCHLORIDE**, 829  
**HYDROCORTISONE SODIUM SUCCINATE**, 833

HYDROMORPHONE HYDROCHLORIDE, 844  
 HYDROXYETHYL STARCH 130/0.4 IN SODIUM CHLORIDE 0.9%, 854  
 HYDROXYZINE HYDROCHLORIDE, 856  
 HYOSCINE HYDROBROMIDE, see SCOPOLAMINE HYDROBROMIDE, 1406  
 HyQvia, brand of IMMUNE GLOBULIN HUMAN, 883

**I**

IBANDRONATE SODIUM, 861  
 Ibiamax, brand of AMOXICILLIN SODIUM, 102  
 IBUPROFEN, 862  
 IBUPROFEN LYSINATE, 863  
 IBUTILIDE FUMARATE, 866  
 Idamycin PFS, brand of IDARUBICIN HYDROCHLORIDE, 867  
 IDARUBICIN HYDROCHLORIDE, 867  
 IDARUCIZUMAB, 870  
 Ifex, brand of IFOSFAMIDE, 871  
 IFOSFAMIDE, 871  
 IMPENEM–CILASTATIN SODIUM, 875  
 IMPENEM–CILASTATIN SODIUM–RELEBACTAM, 881  
 Imitrex, brand of SUMATRIPTAN SUCCINATE, 1460  
 IMMUNE GLOBULIN HUMAN, 883  
 Imuran, brand of AZATHIOPRINE SODIUM, 175  
 Inderal, brand of PROPRANOLOL HYDROCHLORIDE, 1359  
 Indocin I.V., brand of INDOMETHACIN SODIUM TRIHYDRATE, 889  
 INDOMETHACIN SODIUM TRIHYDRATE, 889  
 INFeD, brand of IRON DEXTRAN, 918  
 INFlixIMAB, 891  
 Infugem, brand of GEMCITABINE HYDROCHLORIDE, 761  
 Infumorph, brand of MORPHINE SULFATE, 1119  
 Injectafer, brand of FERRIC CARBOXYMALTOSE, 690  
 INSULIN, 893  
 INSULIN LISPRO, 901  
 Integrilin, brand of EPTIFIBATIDE, 610  
 INTERFERON ALFA-2B, 902  
 INTERLEUKIN-2, see ALDESLEUKIN, 20  
 Intralipid, brand of FAT EMULSION, INTRAVENOUS, 658  
 Intron A, brand of INTERFERON ALFA-2B, 902  
 Invanz, brand of ERTAPENEM SODIUM, 617  
 IODIPAMIDE MEGLUMINE, 904  
 IODIXANOL, 906  
 IOHEXOL, 907  
 IOPAMIDOL, 909  
 IOTHALAMATE MEGLUMINE, 910  
 IOXAGLATE MEGLUMINE–IOXAGLATE SODIUM, 912

IRINOTECAN HYDROCHLORIDE, 914  
 IRINOTECAN HYDROCHLORIDE LIPOSOMAL, 917  
 IRON DEXTRAN, 918  
 IRON SUCROSE, 920  
 ISAVUCONAZONIUM SULFATE, 921  
 Isoket, brand of ISOSORBIDE DINITRATE, 929  
 ISOPRENALINE HYDROCHLORIDE, see ISOPROTERENOL HYDROCHLORIDE, 926  
 ISOPROTERENOL HYDROCHLORIDE, 926  
 ISOSORBIDE DINITRATE, 929  
 Isovue, brand of IOPAMIDOL, 909  
 Isuprel, brand of ISOPROTERENOL HYDROCHLORIDE, 926

**K**

Kcentra, brand of PROTHROMBIN COMPLEX CONCENTRATE (HUMAN), 1362  
 Kefurox, brand of CEFUROXIME SODIUM, 336  
 Kengreal, brand of CANGRELOR TETRASODIUM, 251  
 Keppra, brand of LEVETIRACETAM, 954  
 Ketalar, brand of KETAMINE HYDROCHLORIDE, 931  
 KETAMINE HYDROCHLORIDE, 931  
 KETOROLAC TROMETHAMINE, 935  
 Kineret, brand of ANAKINRA, 140  
 Klaricid, brand of CLARITHROMYCIN, 384  
 Klaricid, brand of CLARITHROMYCIN, 384  
 Kogenate, brand of ANTIHEMOPHILIC FACTOR (RECOMBINANT), 147  
 Kogenate FS, brand of ANTIHEMOPHILIC FACTOR (RECOMBINANT), 147

**L**

LABETALOL HYDROCHLORIDE, 938  
 LACOSAMIDE, 943  
 Ladropen, brand of FLOXACILLIN SODIUM, 698  
 Lanoxin, brand of DIGOXIN, 496  
 Lasix, brand of FUROSEMIDE, 741  
 LEFAMULIN ACETATE, 944  
 LENOGRASIM, 945  
 LETERMOVIR, 946  
 LEUCOVORIN CALCIUM, 949  
 Leukine, brand of SARGRAMOSTIM, 1400  
 Levaquin, brand of LEVOFLOXACIN, 957  
 LEVETIRACETAM, 954  
 LEVOCARNITINE, 956  
 LEVOFLOXACIN, 957  
 LEVOLEUCOVORIN CALCIUM, 962  
 LEVOMEPRAMAZINE HYDROCHLORIDE, see METHOTRIMEPRAZINE HYDROCHLORIDE, 1053  
 Levophed, brand of NOREPINEPHRINE BITARTRATE, 1178  
 LEVOTHYROXINE SODIUM, 964  
 LIDOCAINE HYDROCHLORIDE, 965

LIGNOCAINE HYDROCHLORIDE, see LIDOCAINE HYDROCHLORIDE, 965  
 Lincocin, brand of LINCOMYCIN HYDROCHLORIDE, 975  
 LINCOMYCIN HYDROCHLORIDE, 975  
 LINEZOLID, 977  
 Lioresal Intrathecal, brand of BACLOFEN, 189  
 LMD, brand of DEXTRAN 40, 479  
 LORAZEPAM, 983  
 Lovenox, brand of ENOXAPARIN SODIUM, 590  
 Luminal Sodium, brand of PHENOBARBITAL SODIUM, 1275

**M**

MabThera, brand of RITUXIMAB, 1391  
 MAGNESIUM SULFATE, 991  
 MANNITOL, 997  
 Marcaine, brand of BUPIVACAINE HYDROCHLORIDE, 216  
 Marqibo, brand of VINCRISTINE SULFATE LIPOSOMAL, 1581  
 Maxipime, brand of CEFEPIME HYDROCHLORIDE, 280  
 MECHLORETHAMINE HYDROCHLORIDE, 1002  
 MELOXICAM, 1004  
 MELPHALAN HYDROCHLORIDE, 1005  
 MEPERIDINE HYDROCHLORIDE, 1010  
 MEPIVACAINE HYDROCHLORIDE, 1019  
 MEROPENEM, 1020  
 MEROPENEM–VABORBACTAM, 1031  
 Merrem I.V., brand of MEROPENEM, 1020  
 MESNA, 1036  
 Mesnex, brand of MESNA, 1036  
 METHADONE HYDROCHLORIDE, 1040  
 Methergine, brand of METHYL-ERGOVINE MALEATE, 1058  
 METHOCARBAMOL, 1042  
 METHOHEXITAL SODIUM, 1043  
 METHOTREXATE SODIUM, 1046  
 METHOTRIMEPRAZINE HYDROCHLORIDE, 1053  
 METHYLDOPATE HYDROCHLORIDE, 1055  
 METHYLENE BLUE, 1057  
 METHYLERGOVINE MALEATE, 1058  
 METHYLPREDNISOLONE ACETATE, 1059  
 METHYLPREDNISOLONE SODIUM SUCCINATE, 1060  
 METOCLOPRAMIDE HYDROCHLORIDE, 1069  
 METOPROLOL TARTRATE, 1079  
 METRONIDAZOLE, 1081  
 MEXILETINE HYDROCHLORIDE, 1087  
 Mexitil, brand of MEXILETINE HYDROCHLORIDE, 1087  
 MIFAFUNGIN SODIUM, 1088  
 MIDAZOLAM HYDROCHLORIDE, 1092  
 MILRINONE LACTATE, 1103  
 Minocin, brand of MINOCYCLINE HYDROCHLORIDE, 1109  
 MINOCYCLINE HYDROCHLORIDE, 1109

Mitigo, brand of **MORPHINE SULFATE**, 1119  
**MITOMYCIN**, 1111  
**MITOXANTRONE HYDROCHLORIDE**, 1116  
 Mobiflex, brand of **TENOXCAM**, 1483  
 Monoferric, brand of **FERRIC DERISOMALTOSE**, 691  
**MORPHINE SULFATE**, 1119  
**MOXIFLOXACIN HYDROCHLORIDE**, 1137  
**MULTIVITAMINS**, 1139  
 Mustargen, brand of **MECHLORETHAMINE HYDROCHLORIDE**, 1002  
**MUSTINE HYDROCHLORIDE**, see **MECHLORETHAMINE HYDROCHLORIDE**, 1002  
 Mycamine, brand of **MICAFUNGIN SODIUM**, 1088  
**MYCOPHENOLATE MOFETIL HYDROCHLORIDE**, 1145

## N

**NAFCILLIN SODIUM**, 1147  
**NALBUPHINE HYDROCHLORIDE**, 1153  
**NALOXONE HYDROCHLORIDE**, 1157  
 Narcan, brand of **NALOXONE HYDROCHLORIDE**, 1157  
 Naropin, brand of **ROPIVACAINE HYDROCHLORIDE**, 1396  
 Natrecor, brand of **NESIRITIDE**, 1161  
 Navoban, brand of **TROPISETRON HYDROCHLORIDE**, 1534  
 Nembutal, brand of **PENTOBARBITAL SODIUM**, 1266  
 NeoProfen, brand of **IBUPROFEN LYSINATE**, 863  
**NEOSTIGMINE METHYLSULFATE**, 1159  
**NESIRITIDE**, 1161  
 Neupogen, brand of **FILGRASTIM**, 693  
 Nexium I.V., brand of **ESOMEPRAZOLE SODIUM**, 632  
**NICARDIPINE HYDROCHLORIDE**, 1163  
 Nimbex, brand of **CISATRACURIUM BESYLATE**, 367  
**NIMODIPINE**, 1168  
 Nipent, brand of **PENTOSTATIN**, 1271  
 Nipride RTU, brand of **SODIUM NITROPRUSSIDE**, 1428  
 Nithiodote, brand of **SODIUM THIOSULFATE**, 1442  
**NITROGLYCERIN**, 1169  
 Nitropress, brand of **SODIUM NITROPRUSSIDE**, 1428  
**NORADRENALINE ACID TARTRATE**, see **NOREPINEPHRINE BITARTRATE**, 1178  
 Norditropin, brand of **SOMATROPIN**, 1443  
**NOREPINEPHRINE BITARTRATE**, 1178  
 Noxafil, brand of **POSACONAZOLE**, 1308  
 Nozinan, brand of **METHOTRIMEPRAZINE HYDROCHLORIDE**, 1053  
 Nutrilipid, brand of **FAT EMULSION, INTRAVENOUS**, 658  
 Nutropin AQ, brand of **SOMATROPIN**, 1443  
 Nutropin Depot, brand of **SOMATROPIN**, 1443

Nuzyra, brand of **OMADACYCLINE TOSYLATE**, 1187

## O

Octagam, brand of **IMMUNE GLOBULIN HUMAN**, 883  
**OCTREOTIDE ACETATE**, 1184  
 Ofirmev, brand of **ACETAMINOPHEN**, 2  
**OMADACYCLINE TOSYLATE**, 1187  
 Omegaven, brand of **FAT EMULSION, INTRAVENOUS**, 658  
**OMEPRAZOLE SODIUM**, 1188  
 Omnipaque, brand of **IOHEXOL**, 907  
**ONDANSETRON HYDROCHLORIDE**, 1190  
 Onivyde, brand of **IRINOTECAN HYDROCHLORIDE LIPOSOMAL**, 917  
 Orbactiv, brand of **ORITAVANCIN DIPHOSPHATE**, 1202  
**ORITAVANCIN DIPHOSPHATE**, 1202  
 Osmitol, brand of **MANNITOL**, 997  
 Otrexup, brand of **METHOTREXATE SODIUM**, 1046  
**OXACILLIN SODIUM**, 1205  
**OXALIPLATIN**, 1210  
**OXYCODONE HYDROCHLORIDE**, 1213  
**OXYTOCIN**, 1216

## P

**PACLITAXEL**, 1219  
**PACLITAXEL (ALBUMIN-BOUND)**, 1228  
**PALONOSETRON HYDROCHLORIDE**, 1229  
**PAMIDRONATE DISODIUM**, 1232  
**PANCURONIUM BROMIDE**, 1233  
**PANTOPRAZOLE SODIUM**, 1236  
**PAPAVERINE HYDROCHLORIDE**, 1243  
**PARACETAMOL**, see **ACETAMINOPHEN**, 2

**PENICILLIN G POTASSIUM**, 1249  
**PENICILLIN G SODIUM**, 1258  
 Pentam 300, brand of **PENTAMIDINE ISETHIONATE**, 1262  
**PENTAMIDINE ISETHIONATE**, 1262  
**PENTAZOCINE LACTATE**, 1264  
**PENTOBARBITAL SODIUM**, 1266  
**PENTOSTATIN**, 1271  
 Pepcid, brand of **FAMOTIDINE**, 651  
**PERAMIVIR**, 1273  
 Perjeta, brand of **PERTUZUMAB**, 1274  
**PERTUZUMAB**, 1274  
**PETHIDINE HYDROCHLORIDE**, see **MEPERIDINE HYDROCHLORIDE**, 1010  
**PHENOBARBITAL SODIUM**, 1275  
**PHENTOLAMINE MESYLATE**, 1279  
**PHENYLEPHRINE HYDROCHLORIDE**, 1280  
**PHENYTOIN SODIUM**, 1284  
**PHYTOMENADIONE**, see **PHYTONADIONE**, 1289  
**PHYTONADIONE**, 1289  
**PIPERACILLIN SODIUM-TAZOBACTAM SODIUM**, 1292  
 Pitocin, brand of **OXYTOCIN**, 1216

Plasbumin, brand of **ALBUMIN HUMAN**, 17  
**PLAZOMICIN SULFATE**, 1302  
 Polocaine, brand of **MEPIVACAINE HYDROCHLORIDE**, 1019  
 Polocaine-MPF, brand of **MEPIVACAINE HYDROCHLORIDE**, 1019  
**POLYMYXIN B SULFATE**, 1306  
 Pontocaine Hydrochloride, brand of **TETRACAINE HYDROCHLORIDE**, 1486  
**POSACONAZOLE**, 1308  
**POTASSIUM ACETATE**, 1310  
**POTASSIUM CHLORIDE**, 1311  
**POTASSIUM PHOSPHATES**, 1323  
**PRALIDOXIME CHLORIDE**, 1332  
 Praxbind, brand of **IDARUCIZUMAB**, 870  
 Precedex, brand of **DEXMEDETOMIDINE HYDROCHLORIDE**, 471  
 Premarin Intravenous, brand of **ESTROGENS, CONJUGATED**, 634  
 Prevmis, brand of **LETERMOVIR**, 946  
 Prialt, brand of **ZICONOTIDE ACETATE**, 1593  
 Primaxin I.M., brand of **IMIPENEM-CILASTATIN SODIUM**, 875  
 Primaxin I.V., brand of **IMIPENEM-CILASTATIN SODIUM**, 875  
 Privigen, brand of **IMMUNE GLOBULIN HUMAN**, 883  
**PROCAINAMIDE HYDROCHLORIDE**, 1333  
**PROCHLORPERAZINE EDISYLATE**, 1337  
**PROCHLORPERAZINE MESYLATE**, 1343  
 Procrit, brand of **EPOETIN ALFA**, 605  
 Prograf, brand of **TACROLIMUS**, 1461  
 Proleukin, brand of **ALDESLEUKIN**, 20  
**PROMETHAZINE HYDROCHLORIDE**, 1345  
**PROPOFOL**, 1351  
**PROPRANOLOL HYDROCHLORIDE**, 1359  
**PROTAMINE SULFATE**, 1361  
**PROTHROMBIN COMPLEX CONCENTRATE (HUMAN)**, 1362  
 Protonix I.V., brand of **PANTOPRAZOLE SODIUM**, 1236  
 ProvayBlue, brand of **METHYLENE BLUE**, 1057  
**PYRIDOXINE HYDROCHLORIDE**, 1363

## Q

Quelicin, brand of **SUCCINYLCHOLINE CHLORIDE**, 1450  
**QUINIDINE GLUCONATE**, 1364  
**QUINUPRISTIN-DALFOPRISTIN**, 1366

## R

**RANITIDINE HYDROCHLORIDE**, 1368  
 Rapivab, brand of **PERAMIVIR**, 1273  
**RASBURICASE**, 1381  
 Rasuvo, brand of **METHOTREXATE SODIUM**, 1046  
 Recarbrio, brand of **IMIPENEM-CILASTATIN SODIUM-RELBACTAM**, 881  
 Reclast, brand of **ZOLEDRONIC ACID**, 1601

ReFacto, brand of **ABCIXIMAB**, 147  
 Reglan, brand of **METOCLOPRAMIDE HYDROCHLORIDE**, 1069  
**REMDESIVIR**, 1382  
 Remicade, brand of **INFLIXIMAB**, 891  
**REMIFENTANIL HYDROCHLORIDE**, 1384  
 Remodulin, brand of **TREPROSTINIL SODIUM**, 1526  
 ReoPro, brand of **ABCIXIMAB**, 1  
 Retavase, brand of **RETEPLASE**, 1389  
**RETEPLASE**, 1389  
 Retrovir, brand of **ZIDOVUDINE**, 1596  
 Revonto, brand of **DANTROLENE SODIUM**, 447  
 Rifadin I.V., brand of **RIFAMPIN**, 1390  
**RIFAMPIN**, 1390  
 Risordan, brand of **ISOSORBIDE DINITRATE**, 929  
 Rituxan, brand of **RITUXIMAB**, 1391  
**RITUXIMAB**, 1391  
 Rivotril, brand of **CLONAZEPAM**, 400  
 Robaxin, brand of **METHOCARBAMOL**, 1042  
 Robinul, brand of **GLYCOPYRROLATE**, 780  
 Rocephin, brand of **CEFTRIAXONE SODIUM**, 328  
**ROCURONIUM BROMIDE**, 1392  
**ROLAPITANT HYDROCHLORIDE**, 1394  
 Romazicon, brand of **FLUMAZENIL**, 716  
**ROPIVACAINE HYDROCHLORIDE**, 1396  
 Ryanodex, brand of **DANTROLENE SODIUM**, 447

**S**

Saizen, brand of **SOMATROPIN**, 1443  
 Salbumol, brand of **SALBUTAMOL SULFATE**, 1398  
**SALBUTAMOL SULFATE**, 1398  
 Sandimmune, brand of **CYCLOSPORINE**, 429  
 Sandostatin, brand of **OCTREOTIDE ACETATE**, 1184  
**SARGAMOSTIM**, 1400  
 Scoburen, brand of **SCOPOLAMINE BUTYLBROMIDE**, 1404  
**SCOPOLAMINE BUTYLBROMIDE**, 1404  
**SCOPOLAMINE HYDROBROMIDE**, 1406  
 Seizalam, brand of **MIDAZOLAM HYDROCHLORIDE**, 1092  
 Sensorcaine, brand of **BUPIVACAINE HYDROCHLORIDE**, 216  
 Sensorcaine-MPF, brand of **BUPIVACAINE HYDROCHLORIDE**, 216  
 Serostim, brand of **SOMATROPIN**, 1443  
 Sivextro, brand of **TEDIZOLID PHOSPHATE**, 1465  
 Smoflipid, brand of **FAT EMULSION, INTRAVENOUS**, 658  
**SODIUM ACETATE**, 1409  
**SODIUM BICARBONATE**, 1410  
**SODIUM CHLORIDE**, 1423  
 Sodium Diuril, brand of **CHLOROTHIAZIDE SODIUM**, 348

Sodium Edecrin, brand of **ETHACRYNATE SODIUM**, 635  
**SODIUM FERRIC GLUCONATE COMPLEX**, 1425  
**SODIUM LACTATE**, 1426  
**SODIUM NITROPRUSSIDE**, 1428  
**SODIUM PHOSPHATES**, 1437  
**SODIUM THIOSULFATE**, 1442  
 Solu-Cortef, brand of **HYDROCORTISONE SODIUM SUCCINATE**, 833  
 Solu-Medrol, brand of **METHYLPREDNISOLONE SODIUM SUCCINATE**, 1060  
**SOMATROPIN**, 1443  
 Stemetil, brand of **PROCHLORPERAZINE MESYLATE**, 1343  
**STERILE WATER FOR INJECTION**, 1445  
**STREPTOMYCIN SULFATE**, 1446  
**STREPTOZOCIN**, 1448  
 Sublimaze, brand of **FENTANYL CITRATE**, 681  
**SUCCINYLCHOLINE CHLORIDE**, 1450  
 Sufenta, brand of **SUFENTANIL CITRATE**, 1454  
**SUFENTANIL CITRATE**, 1454  
**SUGAMMADEX SODIUM**, 1458  
**SUMATRIPTAN SUCCINATE**, 1460  
 Synercid, brand of **QUINUPRISTIN-DALFOPRISTIN**, 1366

**T**

**TACROLIMUS**, 1461  
 Talwin, brand of **PENTAZOCINE LACTATE**, 1264  
 Targocid, brand of **TEICOPLANIN**, 1469  
 Taxol, brand of **PACLITAXEL**, 1219  
 Taxotere, brand of **DOCETAXEL**, 532  
 Tazicef, brand of **CEFTAZIDIME**, 309  
**TEDIZOLID PHOSPHATE**, 1465  
 Teflaro, brand of **CEFTAROLINE FOSAMIL**, 305  
**TEICOPLANIN**, 1469  
**TELAVANCIN HYDROCHLORIDE**, 1472  
 Temodar, brand of **TEMOZOLOMIDE**, 1475  
**TEMOZOLOMIDE**, 1475  
**TEMSIROLIMUS**, 1476  
**TENIPOSIDE**, 1478  
**TENOXICAM**, 1483  
 Tepadina, brand of **THIOTEPA**, 1493  
**TERBUTALINE SULFATE**, 1484  
**TETRACAINE HYDROCHLORIDE**, 1486  
**THEOPHYLLINE**, 1487  
**THIAMINE HYDROCHLORIDE**, 1490  
**THIOTEPA**, 1493  
 Thymoglobulin, brand of **ANTITHYMOCYTE GLOBULIN (RABBIT)**, 148  
 Tigan, brand of **TRIMETHOBENZAMIDE HYDROCHLORIDE**, 1527  
**TIGECYCLINE**, 1498  
 Tilcotil, brand of **TENOXICAM**, 1483  
**TIROFIBAN HYDROCHLORIDE**, 1502  
**TOBRAMYCIN SULFATE**, 1504

Topalgic, brand of **TRAMADOL HYDROCHLORIDE**, 1519  
**TOPOTECAN HYDROCHLORIDE**, 1514  
 Torisel, brand of **TEMSIROLIMUS**, 1476  
**TORSEMIDE**, 1517  
 Totect, brand of **DEXRAZOXANE HYDROCHLORIDE**, 477  
 T-PA, see **ALTEPLASE**, 30  
**TRABECTEDIN**, 1518  
**TRAMADOL HYDROCHLORIDE**, 1519  
 Tramal, brand of **TRAMADOL HYDROCHLORIDE**, 1519  
**TRANEXAMIC ACID**, 1522  
**TRASTUZUMAB**, 1524  
 Treanda, brand of **BENDAMUSTINE HYDROCHLORIDE**, 191  
**TREPROSTINIL SODIUM**, 1526  
**TRIMETHOBENZAMIDE HYDROCHLORIDE**, 1527  
**TRIMETHOPRIM-SULFAMETHOXAZOLE**, 1528  
 Trisenox, brand of **ARSENIC TRIOXIDE**, 156  
**TROPISETRON HYDROCHLORIDE**, 1534  
 Tygacil, brand of **TIGECYCLINE**, 1498

**U**

Ultiva, brand of **REMIFENTANIL HYDROCHLORIDE**, 1384  
 Unasyn, brand of **AMPICILLIN SODIUM-SULBACTAM SODIUM**, 133

**V**

Vabomere, brand of **MEROPENEM-VABORBACTAM**, 1031  
 Valoid, brand of **CYCLIZINE LACTATE**, 420  
**VALPROATE SODIUM**, 1536  
**VANCOMYCIN HYDROCHLORIDE**, 1538  
 Vaprisol, brand of **CONIVAPTAN HYDROCHLORIDE**, 417  
 Varubi, brand of **ROLAPITANT HYDROCHLORIDE**, 1394  
**VASOPRESSIN**, 1556  
 Vasostriect, brand of **VASOPRESSIN**, 1556  
 Vazculep, brand of **PHENYLEPHRINE HYDROCHLORIDE**, 1280  
**VECURIUM BROMIDE**, 1559  
 Veklury, brand of **REMDESIVIR**, 1382  
 Velcade, brand of **BORTEZOMIB**, 210  
 Veletri, brand of **EPOPROSTENOL SODIUM**, 607  
 Venofer, brand of **IRON SUCROSE**, 920  
 Ventolin, brand of **SALBUTAMOL SULFATE**, 1398  
**VERAPAMIL HYDROCHLORIDE**, 1563  
 Versed, brand of **MIDAZOLAM HYDROCHLORIDE**, 1092  
 Vfend I.V., brand of **VORICONAZOLE**, 1590  
 Vibativ, brand of **TELAVANCIN HYDROCHLORIDE**, 1472  
 Vidaza, brand of **AZACITIDINE**, 172  
 Vimpat, brand of **LACOSAMIDE**, 943

VINBLASTINE SULFATE, 1569  
 VINCRISTINE SULFATE, 1574  
 VINCRISTINE SULFATE LIPOSOMAL, 1581  
 VINOURELBINE TARTRATE, 1583  
 Visipaque, brand of IODIXANOL, 906  
 Vistide, brand of CIDOFOVIR, 357  
 VITAMIN A, 1587  
 VM-26, see TENIPOSIDE, 1478  
 Voluven, brand of HYDROXYETHYL  
 STARCH 130/0.4 IN SODIUM  
 CHLORIDE 0.9%, 854  
 VORICONAZOLE, 1590  
 Vumon, brand of TENIPOSIDE, 1478  
 Vyxeos, brand of DAUNORUBICIN-  
 CYTARABINE LIPOSOMAL, 452

**X**

Xenleta, brand of LEFAMULIN ACETATE, 944  
 Xerava, brand of ERAVACYCLINE  
 DIHYDROCHLORIDE, 613

Xylocaine, brand of LIDOCAINE  
 HYDROCHLORIDE, 965

**Y**

Yondelis, brand of TRABECTEDIN, 1518

**Z**

Zaltrap, brand of ZIV-AFLIBERCEPT, 1600  
 Zamadol, brand of TRAMADOL  
 HYDROCHLORIDE, 1519  
 Zanosar, brand of STREPTOZOCIN, 1448  
 Zantac, brand of RANITIDINE  
 HYDROCHLORIDE, 1368  
 Zeclar, brand of CLARITHROMYCIN, 384  
 Zemdri, brand of PLAZOMICIN SULFATE, 1302  
 Zemuron, brand of ROCURONIUM  
 BROMIDE, 1392  
 Zerbaxa, brand of ORITAVANCIN  
 DIPHOSPHATE, 323

ZICONOTIDE ACETATE, 1593  
 ZIDOVUDINE, 1596  
 Zinacef, brand of CEFUROXIME SODIUM,  
 336  
 Zinecard, brand of DEXRAZOXANE  
 HYDROCHLORIDE, 477  
 Zithromax, brand of AZITHROMYCIN,  
 176  
 ZIV-AFLIBERCEPT, 1600  
 Zofran, brand of ONDANSETRON  
 HYDROCHLORIDE, 1190  
 ZOLEDRONIC ACID, 1601  
 Zometa, brand of ZOLEDRONIC ACID,  
 1601  
 Zosyn, brand of PIPERACILLIN SODIUM-  
 TAZOBACTAM SODIUM, 1292  
 Zulresso, brand of BREXANOLONE, 211  
 Zydol, brand of TRAMADOL  
 HYDROCHLORIDE, 1519  
 Zyvox, brand of LINEZOLID, 977
