

Medicinal Plants Adopted as Aphrodisiacs by Traditional Gynecologists in the Souss Massa Region

Taleb Ali Khalid*, Aarab Ahmed

ABSTRACT

The population of southern Morocco particularly that of Souss Massa uses traditional empirical care, several specialties of traditional medicine exist in the region including women healers considered traditional gynecologists, these women used medicinal plants to treat female genital disorders. This study was carried out in order to collect information on the therapeutic practices and medicinal plants adopted and used by women healers named locally by "ferraga" or "tachrift" and "tagouramt" in the Souss Massa region (Agadir Idaoutanane, Inzegane Ait Meloul and Chtouka Ait Bahia), in order to preserve and protect this invaluable inheritance from loss and overlook. Using questionnaires, a series of surveys were conducted during the years 2020-2021, on the one hand, among the population (sample of 279 people) to determine the importance of these women healers in the health sector of the region of these women healers, and on the other hand, a survey was conducted among these women healers to collect the recipes adopted in the treatment of female genital disorders especially infertility and sterility in these situations they prescribe aphrodisiac plants. we recorded 59 species, divided into 28 botanical families, of which the Lamiaceae (15%) and the Apiaceae (12%) are the most widespread, and generally Leaves (35.38%) and seeds (18.48%) are the most used plant parts. These results show that the women healers have a very important place in the health service, especially they have a very interesting knowledge of the treatment of female genital disorders. The plants identified in this study could constitute a data base for further research in the field of phytochemistry and pharmacology.

INTRODUCTION

A woman's life is punctuated by hormonal imbalances that begin at puberty and end after the menopause. These various hormonal changes can be accompanied by more or less serious disorders.^{1,2}

Pregnancy and birth have been at the heart of traditions since ancient times, as they are central to the survival of the community. Over time, each ethnic group has accumulated a number of experiences and practices to promote a successful pregnancy and birth.³

Health Organisation, which states that almost 65% of the world's population have incorporated plants into their primary health care modality. Women use traditional practices for abortifacients, emmenagogue, aphrodisiacs, menstrual cycle disorders, inflammation of the genital tract, female infertility and for post-partum care.⁴

In the Sous Massa region, women frequent traditional healers called ferraga, tagouramt or tachrift who are considered traditional gynaecologists who treat gynaeco-obstetrical disorders using plant-based recipes and traditional practices. Given their privileged place in Moroccan societies, including that of Sous Massa, we conducted this study to collect information on medicinal plants adopted as aphrodisiacs to treat gynaecological disorders in order to preserve this traditional know-how.

MATERIALS AND METHODS

Description of the study area

The region of Souss-Massa is divided into four provinces with two prefectures: Prefecture of

Agadir-Idaoutanane and Prefecture of Inezgane-Ait Melloul as well as the Province of Chtouka-Ait Bahia, Taroudant, Tata and that of Tiznit (figure 1). The number of municipalities is 175 including 21 urban and 154 rural, it covers an area of 53,789 km² limited to the north by the region of Marrakech-Safi and to the east by the region of Drâa-Tafilalet, to the south by the regions of Guelmim-Oued Noun and Lâayoune-Sakia el Hamra and in the West by the Atlantic Ocean.⁵

The region currently has nine hospitals (Table 1), basic health care training consists of 292 establishments, including 243 rural health centers and dispensaries and 49 others in urban areas. In addition to these structures, the region has a private sector made up of 23 clinics and 431 consultation offices. The public health density in hospital beds is 1.630 inhabitants per bed, while public medical supervision is provided by 538 doctors: one doctor for 4.976 inhabitants.⁵ But the problem of inadequate health services still persists (Table 2).

Methods of data collection

Firstly, the study is carried out in the three provinces during 2019-2020 and 2021-2022, the surveys are conducted in the local population (278 questionnaires) to collect the information about traditional medicine: the various specialties, the positioning in the health field and the effectiveness.

Second, a descriptive cross-sectional study on treatment practices based on the use of medicinal plants by women healers was carried out by field survey in the different regions of Agadir, Inzegane-ait Melloul, and Chtouka-Ait Bahia (Figure 1- 4).

Given the clandestinity in which these women exercise their healing practices, we used the technique of "open discussion" which consists of asking these healers for the diseases treated and the medicinal plants used via free and open discussions. The number of healers

questioned is 23 (average of 7 women per region) and 21 herbalists. The identification of the plants mentioned by these women was carried out using regional, national and international ethnobotanical studies, the reference specimens of each plant were deposited in the herbarium of

the laboratory of the research team in biotechnology and biomolecule engineering, Faculty of Science and Technology, University abdelmalek essaadi Tangier, Morocco. The data collected were recorded and analyzed by IBM-SPSS statistics base 25 and the graphical representations are carried out by the same software.

RESULTS

Many women suffer from difficulties in getting pregnant (infertility), recurrent miscarriages and sterility, according to the healers these disorders are caused by the effects of witchcraft, a bad spell, cold or the closure of the womb known as "tqaf".

Most of them prescribe a recipe known as *Msakhen*, which designates a mixture of plants that is asked of herbalists. The collection of this recipe has shown a diversity of composition that varies from one herbalist to another. A total of 59 species have been identified, divided into 28 botanical families, of which the most commonly cited are *Myristica fragrans* Houtt, *Piper cubeba* L., *Piper longum* L., *Ginger Zingiber* L., *Foeniculum vulgaris* L., *Elettaria cardamomum* (L.) Maton, *Curcuma longa* L. and *Carum carvi* (L.).

In some of them, special recipes are prescribed:

Palm pollen (*Phoenix dactylifera*), ginger (*Zingiber officinale*), nigella seeds (*Nigella sativa* L.), Indian costus (*Saussurea costus*) and jujube (*Zizyphus lotus*) mixed with honey and taken twice a day.

Seeds of *Daucus carota* var.*sativa*, *Apium graveolens* L. and *Allium cepa* L. in powder form mixed with honey and taken two to three times a day

Use of *Anastatica hierochuntica* decoctate, *Salvia officinalis* infusions and musk-ivet (*Ajuva iva* L.) or *Origanum majorana* L. taken twice a day.

Others prescribe an incense which is a set of plants called *tfoussikha* to treat the closure of the *tqaf* matrix, the recipe varies according to the healer, according to the results collected there are 15 species divided into 13 botanical families and a mineral alum stone.

The results of the survey conducted reveal that herborist use 59 different species for preparing the *lmsakhun* recipe. These species belong to 28 families, the most represented being the Lamiaceae (15%), the Apiaceae (12%) and the Zingiberaceae 8.5%, the other 25 families are less represented they do not exceed 5% (figure)

Plant parts

Leaves are the most frequently used plant parts (35.38%), followed by seeds (18.48%), other parts are less represented with percentages not exceeding 10%

Method of preparation

The powdered preparation 30.77% and the decoction 20% are the most adapted, the powdered preparation is often mixed with milk, tea, or food (bread, soup, couscous), and the decoctions are generally consumed in the form of herbal teas. the other modes of preparation are less common (less than 8%)

DISCUSSION

Traditional healers and herbal medicine are essential in health care in Morocco.⁶ Women healers occupy a very important place in the health sector in the Souss Massa region, they are the most frequented traditional medicine specialty by the population 31%. These women are mainly frequented by the population to treat urogenital affection

According to the survey, the main cause of urogenital disorders is chilling, and chilling can refer to various disorders such as dysmenorrhoea, menstrual pain, sterility, and impotence. And so these healers prescribe plants known as warming plants grouped in a recipe known as *Msakhen* composed of 59 species, divided into 28 botanical families, of which the Lamiaceae (15%) and the Apiaceae (12%) are the most widespread, sometimes the delay in pregnancy is linked to an effect of witchcraft, in which case the healers recommend an incense known as *tfoussikha*, made up of 15 species divided into 13 botanical families, and a mineral, alum stone and generally Leaves (35.38%) and seeds (18.48%) are the most used plant parts.^{7,8} The powdered preparation 30.77% and the decoction 20% are the most adapted.^{8,9}

The frequency with which medicinal plants are cited in the literature is likely evidence of their activity. Of the 59 species cited as aphrodisiacs 47 species have been described in ethnobotanical studies while 12 species are cited for the first time as aphrodisiacs (*Asphodelus microcarpus* Salzm. & Viv. *Bunium alpinum*, *Capparis spinosa* L., *Corrigiola telephifolia* Pourr, *Curcuma longa* L., *Linum usitatissimum* L., *Ilicium verum* Hook.f., *Medicago sativa* subsp. *sativa* L., *Rosmarinus officinalis* L., *Spergularia marina* (L.) Besser, *Petroselinum sativum*, *Rosmarinus officinalis* L.), it is also interesting to note that the present survey revealed two endemic species (*Thymus broussonnetii* subsp. *Broussonnetii* et *Thymus maroccanus* L.).

Traditional healers take into account the notions of dose and toxicity in view of the mode of administration Oral (83.08%), they insist on respecting the prescribed dose, in fact certain species reputed to be toxic are prescribed citing *Aframomum melegueta* K.Schum, *Myristica fragans* *Peganum harmala* *Ajuga iva* *Carum carvi*, *Datura stramonium* which present a neurological toxicity *Glycyrrhiza glabra* *Nerium oleander* L *Origanum majorana* *Cardiovascular* toxicity, *Ricinus communis* *Rosmarinus officinalis* mainly renal toxicity *Mentha pulegium* *Illicium*

This first ethnobotanical study conducted in the region of about the women healers revealed a very rich local knowledge in terms of traditional herbal medicine; this fact was reflected in the great diversity of species used in the treatment of several urogenital disorders. In the light of these results, it is therefore very important to subject some of the main species to further phytochemical and pharmacological studies in order to validate their traditional use and probably discover new bioactive molecules.
